FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ROLE OF PARENTS IN TRANSMITTING RELIGIOUS CUSTOMS TO YOUTH VIEWED

Tirana BASHKIMI in Albanian 11 Aug 80 p 3

[Article by Ramazan Sherja: "Self-satisfaction Reduces Vigilance"]

[Excerpts] Along with the great transformations in the field of the awareness of our people, there are still, here and there, some individuals who preserve in the recesses of their awareness some "traces" of religious views and of backward and reactionary old customs. These remnants, often unintentionally, through discussions or concrete actions, are transmitted by them to children or youth who, if they have not established healthy scientific convictions, often believe them as the truth.

For example, in a plowing brigade in the Lumik agricultural cooperative in Librazhd District, a cooperative member did not eat his lunch with his comrades during the lunch break. It was learned that he was celebrating Ramadan. This caused great anxiety in the mass organizations and in the Democratic Front, youth and women's organizations among all activists. It was learned that the parents of the cooperative member fasted and that they told him that he should do so also since it "was good for him." Either because he did not want to go against his parents or because there were defects in his ideological development, he did not find the strength to oppose them and he submitted to the will of his parents.

There are many cases where family members and sometimes even the youth observe backward old customs not out of conviction but out of respect so as not to oppose their parents. Therefore, as the party teaches us, it is essential that we carry on a united front in close collaboration with the mass organizations, the family and the school.

The remnants of old customs which are still observed in some families often act as obstacles in the affirmation of the new socialist law. For example, influenced by an old superstition, several cooperative members in the area of Krrabe did not wash their clothes on Tuesday because that day is unlucky. The activity of casting light on old habits, especially among some unformed youth in this area, involves another aspect: during their school years, they seem to be very active in the struggle against religious ideology; they propagandize the new, they combat old customs

and they take part in various activities. However, when they leave school, they have nothing to do with this activity, they do not speak up in meetings, they wear veils over their heads and conform to old customs and religious prejudices. These attitudes are often instigated by a fanatical parent who, when he finds the proper "terrain" and a situation where the new ideology has not been adequately rooted, speaks in the name of the "morality" of religion.

The youth organization in Funar has had difficulties in getting participants for an artistic group. Some girls who just graduated from 8-year school did not join the group. Some activists said that "fanaticism was operating here and there and we were hindered by the fact that the girls were influenced by some parents who are still contaminated by the spirit of remnants of religious ideology." The worst thing is the fact that these phenomena are not combatted constantly, every day, but are recalled only when backward customs reappear and, at that time, the struggle against them begins again and the work of persuasion and clarification intensifies. But, the old, conservative viewpoint, often under the cloak of "what is good" for the girls, is doing its evil work. Therefore it is essential that a healthy educational milieu be created in the family and that the terrain be cleansed of petit-bourgeois and religious vestiges.

But, of course, this does not happen by itself. It requires systematic, persistent work, healthy convictions, close collaboration with the mass organizations. Only in this way will such harmful influences be cut off and the "bridges" for the movement of religious ideology, disconnected, especially in the younger generation, whom we have the obligation to raise ideologically pure, morally healthy, and worthy to build socialist society.

HOXHA SENDS CONDOLENCES TO ACADEMY ON CABEJ DEATH

[Editorial Report] According to the Tirana weekly DRITA of 17 August 1980, Professor Eqrem Cabej, linguist, teacher, member of the Academy of Sciences and of its Presidium, died on 13 August 1980 at the age of 72. DRITA publishes the following telegram from Enver Hoxha to the Presidium of the Academy of Sciences on page 1:

"Premature death has removed from your midst one of the most eloquent representatives of science, culture and our national education, the member of the Presidium Prof Eqrem Cabej. With his death, science has lost a person with rare creative skills who put his entire knowledge in the service of the people and of the socialist fatherland.

I express my deepest sympathy to you on the occasion of this sad event.

Prof Eqrem Cabej worked untiringly and with great passion for the development and the advancement of the science of Albanian linguistics and of our people's education. His scientific research activity, especially in the area of the origin of the Albanian language and the genesis of the Albanian people, is rich and comprehensive. It is of national and international importance. With competence, he made a valuable contribution to the documentation of the originality of the Albanian language and of the indigenous character of the Albanian people in their present-day territory.

The work of Professor Cabej in the field of linguistics remains an esteemed treasure in the hands of present-day and future scientists and scholars in our country."

FAILURE TO IMPROVE MINERS' LIVING CONDITIONS DEPLORED

Tirana PUNA in Albanian 18 Jul 80 p 1

[Editorial: "Let Us Struggle Against Any Negligence in Regard to the Continuous Improvement of the Living Conditions of the Workers of Mines, Geology and Sawmills"]

[Text] Everything created and produced in our country is made in the name and in the interest of the working people, because there are the workers who, with the teachings of the party and of Comrade Enver Hoxha in their hearts and minds, break through the mountains and blockades, build socialism and continually invigorate the economy and the defense of the country.

There are wonderful achievements in our country: they show the great concern of the party and of the state of the dictatorship of the proletariat for our working people. Everywhere in our country, various social and cultural projects, dwellings, creches and kindergartens for children, cultural houses, shops, vacation centers for workers and pioneers and centers for relaxation, education and entertainment have been built and are being built. Substantial funds are allocated each year for these purposes. The expenditures for financing socio-cultural projects amount to 1,919,000,000 leks in the state budget for 1980.

In this framework, the funds have been approved and dwellings, dining halls, baths, shops for communal services, centers for relaxation and education and many other socio-cultural projects have been earmarked for construction this year for providing treatment to and supplying the working people of mines, geology and sawmills--the difficult and remote sectors in which a heroic working class works. The construction of these projects is planned on the basis of coordination between the Ministry of Industry and Mines and the Ministry of Domestic Trade in regard to their needs for these projects.

But, what is the situation? One half of the year is already gone and the work has not begun in the two-thirds of the projects to be constructed. Even in those projects, where work has been started, the progress is slow and it is not known when they will be completed. Three years have elapsed since work was started on the construction of a dormitory at the Thirre

sector of the Spac mine in Mirdite District and only three trucks of bricks have been dispatched there. Work has not started yet for the construction of the bath and dressingroom at the Manze mine in Durres, the laundries in Bulqize, Kalimash and in other places, the food store in Memaliaj, the dining hall and dormitory at Uji i Ftohte in the sawmills in Pogradec, and the dormitories of the sawmills in Tropoje, Kolonje, Skrapar and so forth. We can enumerate a number of other projects, but we think that what we have already mentioned is enough to show that the great task, which deals with the further improvement of the living conditions of the workers of these very important sectors, has been neglected. The party teaches us that the struggle for fulfilling the economic tasks cannot be detached from the struggle for fulfilling and continually improving the living and working conditions of workers.

Why, then, do all these things happen? These things happen because the working and living conditions of the workers of these important sectors and because the problems are not correctly understood and not properly considered from the political and ideological aspect by some administrations and, concretely on these occasions, by the responsible directorates of the Ministry of Industry and Mines, by some executive committees, such as in Mirdite, Diber, Librazhd, Pogradec and other districts and by some leaders in the mines, such as those in Bulqize, Kurbnesh and Memaliaj and the geological enterprise in Rubik and of the sawmills in Librazhd and so forth. All the opportunities exist to complete these works on schedule. The government has granted the funds and has planned the materials. Only the correct evaluation of the problem is lacking. Comrade Enver teaches us: "...that the method and practice of some cadres, especially of the government and economic organs, who are interested in everything, in bolts and in cows, but who forget about the essential and decisive factor in everything--the human being, his well-being, life and health, his technical safety, hygiene conditions and in a cultured environment, and his relaxation, education and entertainment--must be severely criticized and seriously condemned."

Nobody is allowed to fail in implementing the tasks dealing with the working and living conditions of workers. The party demands that each manager execute his tasks with responsibility and with complete party-mindedness. For this, all the political, ideological, economic, financial and organizational conditions exist. With a correct revolutionary Marxist-Leninist understanding of these problems and of the lives of the people, all the obstacles and difficulties will be overcome. Therefore, it is here that one finds the source of the problem: the correct understanding [of things] is lacking; there are delays and open manifestations of bureaucracy; and this situation must be fought with force. This is a repeated criticism and, when it is so, then, measures must be taken to prevent it from happening again. The failure to correctly understand the problems dealing with the lives of the people is the expression of bureaucratic manifestations and of the class struggle. In those enterprises, where we find these unpardonable negligences, our trade union organizations, strongly relying on the directives of the party and on the laws of the state must stop and analyze the problem, and the directors of the enterprises and the people entrusted with these problems, up to the Ministry of Industry and Mines and the Ministry of Domestic

Trade, must be made to face responsibility and must give account to the workers. The trade union organizations must stir up workers opinions against these negligences. To fail to construct the projects stipulated by the state plan for the continual improvement of the living conditions of workers means to violate the party line. He who struggles for the fulfillment of the production plan and forgets his duties in regard to the well-being of workers is not a good leader. A good leader is the one who cares for both, because they are inseparable from each other and, above all, at the very end, there are the workers who fulfill the plan and, the greater the concern for the workers the more assured the fulfillment of the plan.

But, why do the trade union councils in districts and the trade union organizations in these enterprises merely look at this unsatisfactory situation? When the government allocates the funds and when the projects are designed, then, the projects must be constructed on schedule, otherwise, we have violated the state laws and, for each case of violation, the trade union organizations must speak up loudly. In this work, we must struggle to execute the tasks assigned by the most recent plenum of the Central Council of the Albanian Trade Unions, which analyzed the work of the Trade Unions in the light of the decisions of the Seventh Plenum of the Party Central Committee. The plenum recommended that "the trade union organizations must struggle with greater force against negligence, carelessness and bureaucratic attitudes which violate the rights of workers and of the working people which are guaranteed by laws." It is not fair at all to wait for the others to do this for us, or for recommendations to be given from above for this purpose. The tasks are implemented every day; therefore, their pursuit must also be carried out every day and every hour. The voice of the working people must rise immediately against every instance of negligence in order to prevent it from becoming greater, so that everything will be as required by the laws of the state, the Labor Code, as the party and Comrade Enver teach us.

GOVERNMENT, PARTY OFFICIALS REASSIGNED

Budapest PARTELET in Hungarian No 8, 1980 pp 18-19

[Article: "The Politburo's Resolutions Concerning Changes in Personnel"]

[The Politburo has appointed the following members of the Working Collectives attached to the Central Committee, the Youth Committee, and the Physical Education and Sports Committee attached to the Secretariat:

PARTY CONSTRUCTION WORKING COLLECTIVE

CHIEF: Karoly Nemeth

SECRETARY: Janos Peter

MEMBERS: Tibor Baranyai, Sandor Borbely, Gabor Deak, Gyorgy Hegedus, Ignac Horvath, Miklos Horvath, Sandor Jakab, Vera Lajtai, Janos Lukacs, Istvan Petrovszki, Sandor Somogyi, Imre Takacs, Istvan Takacs, Istvan Toth, Janos Toth, Jozsef Torok, Tibor Ujhelyi, Imre Vertes, Laszlo Zavori

ECONOMIC WORKING COLLECTIVE

CHIEF: Ferenc Havasi

SECRETARY: Bela Szikszay

MEMBERS: Miklos Ajtai, Jozsef Bognar, Ivan T. Berend, Marton Buza, Bela Csikos Nagy, Lajos Dozsa, Janos Fekete, Istvan Foldes, Karoly Grosz, Istvan Hagelmayer, Istvan Hetenyi, Lajos Hethy, Robert Hoc , Laszlo Horvath, Mihaly Komocsin, Imre Kovacs, Ferenc Kozma, Istvan Kortvelyes, Sandor Lakos, Istvan Martos, Endre Megyeri, Tamas Nagy, Rezso Nyers, Jo sef Nyilas, Mrs. Ferenc Nyitrai, Tibor Palankai, Bela Rabi, Aladar Sipos, Imre Szabo, Jozsef Szabo, Kalman Szabo, Imre Vincze, Lajos Zelko

COOPERATIVE POLICY WORKING COLLECTIVE

CHIEF: Antal Kovacs

SECRETARY: Ervin Zsuffa

MEMBERS: Gabor Nagy Apati, Ferenc Biro, Erno Csizmadia, Ferenc Dobi, Istvan Gergely, Gyorgy Gondor, Istvan Gyenesi, Lajos Hegedus, Janos Hont, Jozsef Molnar, Imre Molnar, Miklos Nagy, Sandor K. Nagy, Vilmos Saghy, Aladar Sipos, Istvan Szabo, Istvan Szlamenicky, Lajos Rev, Pal Romany, Mihaly Vasko, Miklos Villanyi, Mrs Sandor Tuza

CULTURAL POLICY WORKING COLLECTIVE

CHIEF: Miklos Ovari

SECRETARY: Ferenc Molnar

MEMBERS: Gyorgy Aczel, Miklos Almasi, Eva Ancsel, Ivan T. Berend, Otto Bihari, Jozsef Fuleki, Tibor Huszar, Gyorgy Jozsa, Istvan Kiraly, Andras Knopp, Mihaly Kornidesz, Bela Kopeczi, Sandor Lakos, Jozsef Lukacs, Pal Pandi, Imre Pozsgay, Ferenc Ratkai, Peter Renyi, Mihaly Simai, Miklos Szabolcsi, Jozsef Szigeti, Ferenc Tokei, Dezso Toth, Ivan Vitanyi, Adam Wirth

YOUTH POLICY COMMITTEE

CHIEF: Karoly Nemeth

SECRETARY: Gyorgy Fetti

MEMBERS: Janos Barabas, Gabor Borbely, Lajos Csendes, Janos Gosztonyi, Tibor Halay, Bela Hary, Mrs. Gabor Kohanyi, Istvan Kortvelyes, Laszlo Marothy, Istvan Olah, Ibolya Ovari, Gyorgy Sikula, Ferenc Solyom, Maria Szabo, Miklos Szabo, Vilmos Thernesz

PHYSICAL EDUCATION AND SPORTS COMMITTEE

CHIEF: Mihaly Korom

SECRETARY: Jeno Kovacs

MEMBERS: Laszlo Ballai, Janos Borbandi, Istvan Buda, Lajos Csendes, Gyorgy Fejti, Laszlo Fodor, Maria Hanga, Lajos Kiss, Dezso Papp, Sandor Racz, Miklos Raft, Ferenc Solyom, Mrs. Istvan Szucs, Laszlo Varga

The Politburo has appointed the leadership of the MSZMP group of the National Assembly:

SECRETARY: Mihaly Korm

MEMBERS: Antal Apro, Miklos Horvath, Imre Katona, Mrs Gyula Szentistvanyi

In addition to the already announced decisions concerning personnel, the Politburo has made the following resolutions:

It has relieved Andras Korcsog of his position as a deputy chief of the Central Committee's Department of Scientific, Public Education and Cultural Affairs, and has approved his appointment as state secretary for cultural affairs.

It has relieved Ferenc Ratkai of his position as a deputy chief of the Central Committee's Department of Scientific, Public Education and Cultural Affairs, and has agreed to his appointment as a deputy minister for cultural affairs.

It has relieved Ferenc Molnar from his position as state secretary for cultural affairs, and has appointed him as a deputy chief of the Central Committee's Department of Scientific, Public Education and Cultural Affairs.

It has relieved Andras Knopp from his position as a deputy minister of educational affairs, and has appointed him as a deputy chief of the Central Committee's Department of Scientific, Public Education and Cultural Affairs.

It has relieved Sandor Boros from his position as a deputy minister for cultural affairs, and has appointed him as a deputy chief of the Central Committee's Department of Agitation and Propaganda.

It has appointed Istvan Marko, a section chief of the Central Committee's Department of Political Economy, to be deputy chief of that department.

It has relieved Gyula Mona of his position as deputy chief of the Central Committee's Department of Agitation and Propaganda, and has appointed him as a deputy rector of the Central Party School.

WORKERS REACT TO DIRECTIVES WITH CONFUSION, ANGER, CYNICISM

A Mixed Picture

Budapest ELET ES IRODALOM in Hungarian 19 Jul 80 p 16

[Article by Peter Szekulity: "Three Rounds into the Air?"]

[Text] An industrial city somewhere in Hungary--a few monuments, three factories, half a dozen bad girls, 9,000 noisy students, a ramshackle hotel, an IBUSZ [tourist and travel] office and early closing hours. Green peas cost as much as in Pest; new potatoes are more expensive. Since fall you have to pay to park on the square; most of the foreigners loitering in the shops are Poles; the jokes, made up in Pest, have a materialistic view and concern "domestic" matters.

Have you heard this one?

A bigwig takes home 34,000 forints, the Angry Man explains. Then he tells his wife: Woman, put it in the cabinet but don't touch it because they may want it back.

A cabaret story?

Its tone gives it away. You may have heard it 3 years ago in some program. "There are all kinds of people, they talk," the policeman says and laughs with a full mouth. "Anyway, I am not on duty," he says and takes out a ten forint note. The bartender stops him, "Forget it, now I'll pay."

Uncle Sogorka tears off a bunch of parking coupons without counting, "However many there are."

He stutters, "C-c-count them. Its O K-k-kay."

"And the tip?"

Beat, Uncle Sogorka stands and waves hesitantly at the departing Volga. "You see," a man with a beard behind me says, "the differences in property

are increasing." The girl beside him says, "This is not a property difference, this is standard of living, you nut." "You don't understand," the beard answers and embraces his girlfriend.

The girl shivers, "Breathe some warmth into me."

They are out of spirits. Keszeg, the misshapen one, crosses the square. He laughs and puts the pocket radio to his ear. "Stay fresh," the market woman says, and sprays beer on her seedlings.

At two thirty Pal Balogh is waiting in his apartment. One and a half rooms with all the comforts, and the house and yard. He and five others got it from the council in 1960. Since then the prize has shrunk, the man is outgrowing the apartment.

Balogh had worked until two and he is mad.

"Rejects come to 17 percent. Three is permitted. The man in charge of usable scrap begged me with hands together: Pal, my friend, do something. Me? I am only a worker."

"They say you are an outstanding expert, only a little stubborn."

Neapolitan biscuits are served in a little dish. Aranka, the oldest girl, encourages me, "Take some!" I crunch some lemony biscuits and drink ice cold raspberry juice.

"I have had it up to here," my friend says, clenching his fist.

His wife turns toward him with an anxious face.

"You crazy old man! Did they entrust the factory to you?"

He answers quietly, "That's the trouble, that they didn't entrust it to me."

"What would you do?" I ask lightly.

"What? Pow-pow-pow-pow. Three rounds into the air, to scare them."

"Who?"

"Everybody who steals, cheats, lies, bamboozles, loafs."

"They would slap your face, you are just running your mouth." the woman warns.

"Slap? Who is slapping whom here? They robbed the automatic vending machines. And what do you think happened? Instead of trying to find out

who did it they took out the vending machines. In our factory the situation of the NATIONAL ECONOMY really worries the bigwigs. But about what happens in the factory? They are silent about that. It is as if the national economy had been entrusted to them, but not this cruddy factory."

"What are they silent about?"

"What's wrong. That's what. About why they do not dare to make demands! Why are they afraid?"

"Who is afraid?"

"Both the workers and the leaders."

"You will be cutting off the tree from under you if you fight with each other," I pontificate.

"Cut, hell. Since last year we have been blowing, we had to do everything.. And what changed? Nothing has changed. Everything is the same as it was and everybody is where he was. There's lots of people carrying signs and even more word farters. What do we have to do with it? But who cares? They nod or shout and everything remains as it was. Only the prices change."

"Should I speak in your name?"

"You want to ruin everything?" He grimaces, his face is distorted and he pulls at his hair. He mimics a common acquaintance, Daniel, a barber who was made a technical supervisor, who is always afraid he will be dropped and when dismissal threatens always reports in sick and goes to a hospital for a checkup. He is a trained gold brick.

Pal Balogh stares into space.

"Nothing can be done."

Now he reminds me of the scrawny English teacher on television who, in cork hat and with net, hunts for the peacock butterfly--in vain. He is a bitter man, accusing the system of weakness, counting the days, and if he could be would have retired already.

I wanted to see the factory from inside.

"I haven't been here long," the softspoken party secretary says the next day, and introduces a lively looking main department chief. In general he speaks as follows:

"The comrade is a journalist. He would like to talk with a few workers. Quality, productivity, thrift, etcetera," he says and leaves his desk and sits with us, but to the end acts as if he was not there.

The main department chief squirms and wipes his glasses like Vitray on TV. Both of them murmer the same magic words, they are speaking in economic policy. This is the fashion now in Hungary. Yesterday Uncle Sogorka stuttered to the icecream girl on the corner about the negative aspects of stockpile management, the butcher at Hidegkut gave a lecture on economizing on imports while slicing ham, especially emphasizing the replacement of raw materials of foreign origin. The man selling soda in Hangod surprised me with economic policy quotations, instead of words from dance tunes, so I would consider him cultured.

I know the lesson, and so does the main department chief. We perfectly intone the 130 magic words of economic policy. The party secretary sits quietly in his armchair. If he is giving grades, I think, he will give us both good marks.

The main department chief looks up: "What's this, you're not writing?"

I ask courteously: "What should I write?"

He goes on with disapproval: "We know the given situation better and it is in our common interest to avoid mistakes. No?"

"But, of course," I say and I think: Time is passing, the sermon better be over soon. "What has changed?" I ask him with pen raised, but dreamily, as if it just came into my mind.

"We have become more strict. Yes, more strict," he says emphatically.

"Strict. In what sense? Maybe you mean taking the vending machines out of the factory?"

He just goes on. He says nothing definitely, and takes back four of every three sentences. In the meantime he makes a call to get me a guide and spells out what is worth seeing. He is wasting time and I am afraid that I am going to be caught in the network of offices. My attention is wandering. I ask tiredly: "Is my guide coming?"

"We have sent for her."

"I've got to go."

He winks.

"Ah, well, does the comrade director know you are here? In any case it would be proper for us to talk to him. A mere formality." He reaches for the phone with an uncertain movement.

"Isn't the comrade secretary enough for you?" I ask.

He is confused. He doesn't know what to say.

"So," he drops his hand and shrugs, what do I care.

Someone calls. The lady comrade has come.

"Let's go, let's go, take a good look around," the worry-burdened main department chief sends me off.

Antal Gulyas, the shop chief, is escaping from me. I go in and he goes out and he evaporates like camphor.

I finally catch him and start talking.

"Work time is 8 hours. Do they work the whole time?"

"Yes, indeed."

"When is the breakfast break?"

"From seven fifteen to seven thirty. A quarter hour--10 minutes, 20 minutes, whatever it takes. The shop clerk writes down what people want and goes to the buffet to get it. An unskilled worker helps bring the stuff."

"Every morning?"

"Every morning. People have to eat."

"That's true. But in that case they do not work 8 hours."

He is silent, and pulls his neck down between his shoulders. A man, his hair thoroughly greased, grins through the door. I know him, it is Keszeg, the misshapen one. He wants a light. Comrade Gulyas lights his cigarette and the greasy one wanders off. The shop chief gives me a painful grin.

"You saw?"

"I saw."

"He farts in his pants but he is a WORKER. With capital letters, a WORKER. He has little talent but his self-respect is magnificent. This morning I said to him: What's happening, Keszeg, are you waiting for the pohtographers again? He objected and sputtered: How are you talking to me, am I what you are? I thought: No indeed, Shithead! But I didn't dare say it. As long as I cannot hit such a shithead in the face with the truth, and with his work book along with it, just so long there will be no order in Hungary and there will not be 8 hours of work. Seven maybe, or six, but not eight. That's what I say and I will eat my hat if you write it," he bellowed.

"Others have written it already. This requires no courage. It is action which requires courage."

"Good shot. Only here everyone always has his thing. There is always an explanation and excuse for everything. It is not only the leaders who are appointed, even the models are nominated in a campaign."

He shrugs.

"It is a bitter struggle. I have an unskilled worker here, one of those 'uh, yeah' types. A person would think he couldn't count to three. I swear, this guy figured out how to rob the vending machines. But who has the energy to prove it and take action in hundreds and hundreds of cases."

What can be done?

"Didn't I tell you so?" Antal Gulyas says and turns away.

My guide takes my arm, "Come, I will show you the future, the great assembly hall."

In the anteroom of the new gate a man in a velvet jacket is holding up the wall. He is waiting for his brother-in-law from the package room.

The way he feels at home is fascinating--and the fact that he picked working time to cultivate his kinship relations. My Gos....

Did they send for the brother-in-law? They did. I laugh. This is the situation here with us. There is always somebody waiting for somebody at the gate. And somebody always sends word from the gate. With the inimitable familiarity of the peasants of yesterday they now wait, not at the end of the field, but in the cool of the factory gates to talk about the christening, the engagement and the use of green manure with the old buddy, the happy father or the father-in-law chief agronomist, who now learns everything from the son-in-law.

"Where can I get some coffee here?"

I had hardly said it when Auntie D. cut across the smooth factory courtyard toward the foundry. She cried out eagerly: "How many sugars?" The service is quick and obliging. One can get a black coffee more quickly in this factory than in the elegant Eva espresso on the main square.

"Do you always have it?"

"If not, we make it. How long are you staying?"

I know. Hanna A., one of the warehouse workers, makes the best coffee. She works a mini-espresso for her own profit, and asks three fifty for a double. She has been warned a few times to quit it. Only she is a sign carrier and word farter; she doesn't quit it. The business runs all day; she plugs in in the morning and doesn't unplug until evening. She has 18-24 customers, loading workers, cart operators.

Six or seven are lounging in front of the warehouse.

"How much do you brew every day?"

She reflects a moment about how much to say.

"Twenty or twentytwo doubles."

I think, only one kick in the pants would make her come to her senses. Now it is too late. She is of protected age and everyone is afraid of her mouth. I think about Beni Boldizsar. This Boldizsar was worn out from walking and went to the refrigeration plant in B. as operator of the weigh house, but they offered him one of the fish shops too, where there was no business all year long. Beni Boldizsar considers the link position to be an allowance. "The workers march, but we carry the sign, we are the enthusiasm." I recall Balogh's words. "What do we have to do with it?" he said.

The assembly shop is a spooky pantomime hall.

The factory is working on a western order. The customer looks for faults in the final product with a magnifying glass. Thanks to this these workers, even those who have only read about it in books, also hate capitalism. The capitalist quality control official is merciless. This is no good, this is no good... even goods which look perfect to the naked eye but which are not perfect for some reason are thrown away one after another.

"There will have to be some accomodation here. If we don't talk to the customer someone else will," the shop chief explains.

Some of the work is jobwork. Sandor H., semi-skilled worker, says grinning: "I am a guest worker here, but I don't like it a bit."

"Our chief goal is to reduce waste," the shop chief emphasizes.

There are all kinds of people. How to reduce waste? One recommends punishment, another raising the pay, a third patient enlightenment work. Pal Balogh recommends three rounds in the air and I, as a fifth recommendation, recommend a psychologist. I believe people must be relieved of tension and of the dread which is acquired, which is born with us, if waste is to be decreased.

"Organizing the work processes would not hurt. But tell me, isn't it odd that we must learn from the capitalists what 100 percent perfect work is?"

"They are teaching us," the shop chief says with a grim face. "Anyway, we are not learning from the capitalists but rather from the most developed."

It is a fitting rebuke.

The uncle of my girlfriend Marlen is a skilled worker in the FRG. The tempo there is simply breath-taking. After supper the uncle drinks half a bucket of beer and falls into bed. This is the price there of a car, color TV and a trip around the world. Workers, officials, professors and everyone who gets paid all work as hard as they can.

Do we need this? My heart says no; my brain says yes.

Marlen says with alarm: "I'll never get to ride in a Volvo."

I look around the pantomime hall with a rather guilty conscience. Have we thought this through? To lead in a socialist manner and to make strict demands at the same time--isn't this squaring the circle? People have both hearts and brains. Somebody tell me, which should Antal Gulyas, the communist shop chief, listen to there in the plant, to the one or to the other?

The woman guarding the new gate growls at an approaching slovenly woman: "Dear sister, you want something perhaps?"

She begins to make excuses.

"Goodgye."

The woman guarding the gate chases her away and sits back down with satisfaction. Put an end to the in-and-out. Last year virtually anyone could sign people out; this year only two people have this right and the number of those leaving on their own has been reduced from 45-50 to 2-3. The woman at the gate repeats what the main department chief said, "We have become more strict."

It is scary. Is it right to say such things?

It is evening in the cantine and the Angry Man is storming against the laxity. The bartender scratches his back and says wisely: "This noon I was listening to the radio. They said effort was in vain if the conditions did not exist, nothing could be done."

"Do you believe in God?" a middle aged man asks. The bartender wipes his hands and turns to me: "Mr. Editor, you are now my guest, but tell me, why are you upsetting my friend? If he makes money you badger him for that and if he doesn't make any money you badger him for that."

The policeman answers: "Although I am not on duty, still the press is very powerful."

Very powerful? The Angry Man looks up with emotion and says in a solemn voice: "Well, then, turn on your radio. Quickly. Let's hear the news."

Individually Tailored Solutions Needed

Budapest MAGYAR HIRLAP in Hungarian 10 Aug 80 p 5

[Article by Istvan Matko: "Scaring People"]

[Text] "Three rounds into the air, to scare them," says a worker named Pal Balogh in a report in ELET ES IRODALOM. "Because people are stealing and there are too many sign carriers and word farters and trained goldbricks. And everything stays the same. Only the prices change." The reporter presents this Pal Balogh as a bitter man; and if he could he would have retired already.

What the man in the report feels--that is his own affair. It is also his own affair what he thinks proper to end the problems. For example, the three rounds into the air in the title, or a psychiatrist or work organization or agitation. It appears that the reporter is sympathetic with scaring people. It is true that he does this carefully, because he puts a question mark after it. And I may take it seriously even if he does not. I confess that I do not like expressions of opinion which leave doubts because if someone publishes something it is no longer a private affair. As a result I am involved, we are involved, and we have the right to know what is being proposed to me, to us, what they want to call our attention to. because of these doubts, among other things, I do not take the three rounds seriously. Let them go into the air, past my ears.

But there are things which cannot be escaped so lightly. The report describes a plant where they manufacture much scrap--where there is a private coffee shop being run for private profit. Where they basically misinterpret worker self-awareness and worker status and do not dare fire a worthless loafer because they are afraid of somebody or something (?). And where, by the way, they are working on a western order, where "the customer looks for faults in the final product with a magnifying glass, thanks to which these workers, even those who have only read about it in books, also hate capitalism." For the sake of weaker spirits the report underscores this with emotional content, with the words of semi-skilled worker Sandor H., "I am a quest worker here, but I don't like it a bit." It is unfortunate that this certain Sandor H. does not say in more detail what he is against. Is it that he must meet strict norms and must work more precisely? Or that he must do jobwork on a western order? Or is he protesting out of self-esteem, "just because"?

There is no answer--only one sort of explanation. There is talk of somebody's uncle who is a skilled worker in the FRG, where the tempo is "breath-taking." The uncle drinks half a bucket of beer after supper and falls into bed. Everyone there who gets paid works as hard as he can...

Ah, now I understand. Is this the alternative which Sandor H., for example, rejects? This would be capitalism--the breath-taking tempo, to quote the report. "I look around with a rather guilty conscience.... Have we thought this through? To lead in a socialist manner and to make strict demands at the same time--isn't this squaring the circle?" the reporter asks.

Much comes into my mind in connection with this poetic question. For example, that something has been hopelessly misunderstood here. One can hardly base a judgment--at least a worthy one--on this; things can hardly be decided on this basis. No, because I have been hearing this not rarely recently, from here or there, similar "clever, concerned" people who appeal to public opinion and emphasize the "doubts." Thus: Does a strict demand for performance suit the spirit of socialism? Do the strict quality and quantity norms and distribution according to performance suit our historic aspirations and goals? In this case--the "breath-taking tempo"?

I have a modest observation. In my opinion, when one says "socialism", when one builds and cultivates socialism and at the same time demands and works strictly and distributes on the basis of performance, even works sometimes with breath-taking tempo, one is not squaring the circle.

It is true that in order to understand this one must start from the real facts, from an understanding of political-economic laws. One must not start from chance, vexed impressions, from the pretended wisdom of kibitzers, from what seems to be or from an emphasis on primitive questions. This would provide no way to evaluate what it is that characterizes the industrial production of developed capitalist countries today (which the report tries to do in order to scare people). It is sufficient to recall that one does not have there a self-serving campaign which ignores economic considerations. This no longer pays.... The mechanical production line of Chaplin's "Modern Times" is becoming as much a museum piece as the famous Model T Ford.

But what is more essential--it would be a mistake to equate efficient, strictly controlled production aiming at maximum achievement with capitalism.

If you will forgive the simplification, I mean by capitalism the exploitation of man by man, the unjust expropriation of the work of another. Productive, efficient creation of value is not (only) a capitalist category! It fits very well into the frameworks and circulation of socialist management; although there was a time when this was not seen so clearly as it is now.

We know very well that it is not easy to clarify concepts. Drawing conclusions and putting them into practice is even more difficult and more complicated. It has taken long years to prove that the ingrained reflexes, rules, customs and institutions are insupportable. Automatisms which had been believed eternal have been abolished. Who would doubt, for example, thatthe egalitarianism so often condemned in so many forums maintains its positions by the work benches, within the walls of offices--and deep in the souls of men?! Where do they accept with a self-explanatory shrug of the shoulders the fact that simply to maintain the standard of living already achieved it is necessary to work better and more productively? That even less may be created of what formerly there was more of officially.... We know very well that human interests do not adjust automatically according to the commands of time and social needs. There must be a struggle for this. Conflicts must be faced and battles won. In the social arena and in human thinking alike.

The struggle taking place in souls--the reporter feels this himself--requires many sorts of tools--a scientifically precise evaluation of the situation, the realistic experiences of the practice of socialist construction, a correcdt interpretation of world processes and communist steadfastness, just as much as flexibility in tactics. Passionate, critical and self-cricital debate or cool, temperate economic analysis, depending on the given situation.

Although the range of tools offers many other methods and tools in the interest of a solution, we must eliminate from this range those things which are obvious mistakes. Especially the apostasy which irresponsibly and light handedly would fire warning rounds into the air.

The task before us is so honorable and at the same time so difficult that we must spare ourselves superfluous fear. So let us be thrifty with gun powder. There is no sense in firing blindly. It would rob us all of too much energy.

SHED DISENCHANTMENT, REBEL FOR RIGHT TO ACT, WRITERS URGED

Budapest ELET ES IRODALOM in Hungarian 9 Aug 80 p 4

[Article by Sandor Csoori: "Concerning the Plaintive Voice"]

[Text] I do not envy anyone who, out of obligation, curiosity or individual initiative, reads through our literary papers and journals week after week, month after month. It would be a demanding task simply because of the volume--but the emotional effects! Most of what appears--be it poetry, short stories, novellas, drama or articles--reeks of blood and gives off a foul odor, like meat in a can.

I am reading this week's ELET ES IRODALOM, the "light reading" paper of our intellectual life. I begin on the last page with a moving, colorful report by Peter Szekulity. His quick sentences seem to skate on the surface, but by the time a man is finished with them there is a bitter taste in his mouth. The world is a mere grimace. Confusion and impotence everywhere. A swindle, fruitless, a hip-swinging fiasco. Do those in the report speak of honor? The world is dandelion fluff blown in the wind. It was, it is not, seek it no more. The eye and the soul are empty and parrots speak of the weighty problems of society... What I might make of his lines, if I really tried, is that here to our left trembles a country worthy of a better fate, a distorted smirk at the corner of its mouth; an antispasmodic might help it but there is none at hand.

Szekulity packages his dejection so finely, with such educated distrinction in style, as if a cut-off pig's head were wrapped in tissue paper.

He does not want to pretty up reality, only to get it accepted. To make fit for high society a rumination over shocking things.

Let no one misunderstand; I am not barking at my colleague, I am only saying how well we have learned to formulate things and slip around in circumstances which are getting hard. The "literary pessimism" of the 1950's was a hanging crime. Admitted ill humor was treason. The present disenchantment, despair and beastly tone are the signs of moral behavior. Appurtenances of telling the truth. With the passage of time a softened

revolutionary spirit has become absolutely grand; we can even feel repugnance in a gilded language! We can dangle swamps and polluted continents on our arms like Juhasz and we will be acceptable, even fascinating, because of their scale!

But let us look through the paper further. A debate has been started on the situation of young writers. The tone of the contributors is just as veiled, wry and bitter as that of Szekulity. As if we were not reading debate articles but rather plaintive messages. Like a letter of Kelemen Mikes from some present day exile. "I am not a young writer," writes Gyula Kurucz. "Nor are the members of my generation. Ours is a generation tired out in struggles to survive, in resistance, in cunning and uncertainty. That literature is young the authors of which are truly young...."

The tone surfaces without apology. Because it has long been free to confess such things--to grumble, lament and mock, all day long. To admit our defeat; to admit that death is playing with us in the summer afternoons, that we are weak in resistance; but to ask for whom and for what we have remained spiritually rachitic is no longer recommended. And what is even worse, a voice which would call someone to account does not enter out minds.

Even going beyond the journals, independent authors also pile up a multiplicity of perplexing questions in work after work. The ruins mood of unassimilated, shameful, stupefying lives. He who has carefully read, for example, the novellas of Galgoczi and Hajnoczy, the dramas of Csurka, the meditations of Gyula Fekete or the sociographies of Moldova, written with the point of a knife, might be dumfounded by the mass of depressing phenomena, by the condition of public morale, morality and overthrown hopes. What crystalizes out as the sum of all their books is that the Hungary of the 1970's--despite the more optimistic counterpoints, the standard of living and the freer movement--is a country sick at soul. The neglected, the maladjusted, those who would destroy themselves reel through every stratum of society. The swindled, the confirmed alcoholics, the rejected suitors of socialism, the prematurely old, the hand wavers, the apathetic citizens who feel themselves to be lodgers in the country. Believers and attractive enthusiasts? There are none. Or if there are still a few. sooner or later the will, and for that very reason the musculature of hope, will curdle within them and they will recoil from themselves.

Moldova's latest book, "The Sacred Cow," can be regarded not only as a masterpiece but also as a work illustrating the psychological state of the country. Every line is about the textile industry; but the book itself is a good bit more than this--it is a devils' seesaw of hair-raising things turning in the din of futility. Iron workers, teachers, construction workers, nursery school teachers and office workers have snapped up a hundred thousand copies as if it had been suddenly permitted pornography, with titillating, rogish chapters.

What the shameless voracity of the readers discloses is simply that the thirst for social truths now stands where lurk the images and stimuli of a sexuality kept under wraps--it is a form of satisfaction to be permitted only to speak of them!

From time to time literature exudes from itself even the most bitter gall, but at such times the reader gets only as far as a "spiritual exercise," because at the very time reality is being expressed most nakedly he experiences the torture of knowing that one can speak, but one can hardly implement the words, the recognition. Such one-sided spiritual action only fattens illusions, or makes the individual inhibited. As with the disorders of sexual life, it can cause confusion in our relations with the world also. For he who cannot exercise an everyday, rational speaking of the truth is gradually forced to avoid even obvious truths. He thus kills in himself every seed of communal life, communal feeling and communal undertaking and he necessarily beats about the bush. A man left to himself can get ahead only by selfishness, accomodation and compromise. This is the moment when society begins to crumble and fall apart into its individuals. I lie, I cheat, I am cunning, I wear a mask, I wave my hand and I adjust my future to no commonly approved idea but only to my own.

In this way the part is not a part; on the contrary, it remains a secret rival of the whole.

So one does not absolutely need another organized force for there to be a "dual power" in one country; it is enough to have a quarrel played out in souls. It is enough if the individuals--instead of open opposition--split themselves from the central will and set up in themselves another order of values from that of the official organs. Another order of values in work, in the concept of honor, in the wounded relations of words and actions. But mute criticism is only a partial solution because it will not lead to true victory, what remains will trip a man up; it leads to fatigue, apathy, barrenness, perplexity.

Let us not try to gloss over it; contemporary Hungarian literature gives a dismaying report on this social condition, this general state of health. Our bad dreams in which we weep over the early death of a friend or run naked through the streets with a knife; we drink, we rage, they put an oily rag in our mouths and then throw us on a truck among the dead fish.

Of course, our awakening to our psychological condition does not help much because we will continue to regard our neurosis as a given, just as the Eskimo regards the endless fields of snow.

I feel in my skin, in my nerves locked in a vice, that in the long run self restriction is also the restriction of being. A decimation of the varied possibilities of life. It is an idea which gives birth to boredom. The expanded re-production of the plaintive voice has become independent of our will.

As a writer and as a reader I note with alarm the sameness of contemporary Hungarian literature. Is some change approaching? Will someone write a book, will someone edit a journal in which something different will flare up beyond the production of truth for the warehouse? Strength, enthusiasm, some confession or desire increasing to intoxication? Something, be it super-human or sub-human, but which will break out of the internal infinity of the soul? Ady, Attila Jozsef, Moricz, Laszlo Nemeth or Lorinc Szabo gave us a personal gift because, breaking out of the frameworks offered by society, they always viewed society from the heights of human existence. Thus their plaint was not a mere complaint, but a view of existence. Their confidence was not a simplified confidence but rather a condition of the search for the salvation of man.

According to Ortega every nation has a different spirit. And so a different culture--let us add. Different feelings and a different system of recognition. This statement, which at first hearing sounds nationalistic, is nothing more than if we said, speaking of fruits, that this is meaty, this has seeds, this has a stone. Such a distinction in itself does not at all mean isolation.

At most it means self-identity, without which no people can live as an adult people.

I see our literature struggling in a condition of melancholy vegetation, achieving only half-successes even with its outstanding values, because if a nation is not a common undertaking then there is a reflex of uncertainty in its every movement. And in its spirit too.

The present regime has obviously and primarily economic goals. It believes that economic achievements will of themselves be transformed into national values. They will not be transformed! Indeed, it may happen that the well known example will be realized in our case--we sit with ill temper in the beautifully built house, we eat cold raspberry cream and listen to the news reports about our barrenness.

Going beyond the lamentations and the inventories of scandal, our literature, stewing in its own bitter juice, must learn to rebel in the name of life struggling for the right to act. Laszlo Nemeth teaches with the wisdom of life: "A man can be of use to the world in one way, if he comes to terms with himself."

Not only an individual needs self-identity--so does a nation and the literature of a nation.

PROVINCIAL VOCATIONAL SCHOOL TRAINEES ALIENATED IN BUDAPEST

Budapest VALOSAG in Hungarian No 7, 1980 pp 65-73

[Article by Ferenc S. Lidra: "Provincial Vocational Students in Budapest"]

[Text] The student hostels' task--especially as far as the vocational schools are concerned--is the stepchild of our professional literature in education, sociology and psychology. While, for example, the problems of boarding school education and of the overall problem of vocational training have for years been the focal point of research, we find only occasional professional studies dealing with this specific area. However, vocational schools have a tremendous role in the development of the world view, life style and perspective of youths from peasant rooted families and rural milieu, who are becoming city dwellers and workers at the same time. Practice, however, illustrates that those concerned are either failing to recognize this important role, or are attempting to set educational goals for themselves and serve unreal, irrelevant concepts. In this work I cannot even attempt to survey this unrealistic educational practice. My undertaking is considerably more modest. I followed 50 students from their selecting a trade to their becoming skilled workers. I sought to discover how much their lifestyles changed from the standpoint of one of its important constitutive elements: how their free time was spent.

The 50 students selected filled out questionnaires on three occasions: in September 1976, in their first weeks in Budapest; in the spring of 1978, in their second year; and in the spring of 1980, nearly one year after taking their skilled worker examinations. On all three occasions the gathering of data was supplemented by tape recorded in-depth interviews. Additional interviews were also conducted with residence masters, the director of the vocational school, parents and village teachers.

Characteristics of the Group, Family Background

The vocational school, in addition to providing instruction in a given field, also serves other social functions. It prepares one for the worker's life, itssocializes. It provides refinement and general culture. Since it is a mid-level training institution, it provides the opportunity for further

study. In the performance of all these tasks, it participates in the promotion of social mobility, when it provides urban work opportunity to children who were rurally raised, or when it provides a trade to the children of unskilled parents.

Of the 50 observed students, 33 studied construction industry trades (insulator, parquetry inlayer, mason, painter), and 17 studied wood working industry trades (carpentry, upholsterer). Of the construction industry students, more than half were from Szbolcs Megye, more than a quarter were from Hajdu Megye and nearly 10 percent were from Bekes Megye. The remaining 10 percent were distributed from other parts of the country, but were chiefly from Fest Megye, and were mainly children of the "first generation" who had previously moved to the vicinity of Budapest. In examining the occupations of household heads, unskilled parents who worked in industry or agriculture were predominant. The fathers of only three children were skilled workers, and in only one case was the head of the family not a manual laborer. This was a mother who is an administrator, raising her child alone.

Although it would be incorrect to draw far-reaching conclusions from the data of our 50-person sample, it still appears--and other sources also corroborate this--that these students are in a multiple disadvantage situation among the already disadvantaged vocational students. They have a longer road to travel from the peasant background of their grandfathers and fathers to become skilled urban workers, and they have more obstacles to overcome. In such families the number of children is considerably larger than the national average. Only 3 students are only children, while 15 have 4 or more siblings. In the majority of the families the other siblings have not progressed beyond the life of a skilled worker either. We find secondary school graduates in only 2 families, and white collar employment among older siblings in only 2 cases.

For a long time, the inhabitants of less industrially developed areas have been looking upon the construction industry as the first stage towards their moving to the city. There are always openings in the construction industry, the work there is less frightening than in the factories, and they have acquaintances working in it who can help them in the initial difficulties of beginning employment. In such families the child, for the most part, clearly realizes as soon as he reaches the senior section, that his future is to go to Budapest to learn a trade. "It is not specific trades which attract them, but rather the skilled worker status which promises a secure existence," write Mihaly Csako and Ilona Lisko in their study analyzing the role of vocational school training in social mobility. We may add that the certain advancement is through the capital city's vocational training institute. Nearly free hostels, nearly free board, scholarships, social scholarships, travel home at reduced rates--all these are attractive to the parent. For the youths, however, the romance of the capital is the attractive force, since everything that counts comes from

there--this is where blue jeans may be purchased; this is where popular beat editions may be acquired; this is where the new films are first shown.

In most cases, the parents are happy to be relieved of the burdens of child rearing. This does not mean only financial burdens--although these must not be overlooked--but those of caring, providing and disciplining. Among our students, the number of those from divorced parents, orphans and semiorphans is considerably greater than average. Alcoholism and families in process of disintegration are common. It also often occurs that there are serious, difficult to discover tensions beneath the apparently orderly surface. In the group of 50 children, the parents of 9 are divorced. Of these, there was remarriage in 5 cases, and the mother is rearing the children alone in 4 cases. Being semiorphaned is also frequent. We have five families in which the father has died and the mother is rearing the children alone.

Mothers remaining alone without male support because of death or divorce, remarried parents in the crossfire of the cruelties of the adolescent boy, older parents with "late" children--all these are reasons why the child should go to the college, to relieve the burdens of childrearing and to ease the problems.

Types of Activities Before They Went to Budapest

One question was: How did you most like to spend your free time at home? Most selected sports activity. (Here I included all activities which indicate regular physical exercise, not only sports conducted competitively.) The kind of replies most often given were: playing soccer and table tennis, swimming, and bicycling. Many also participated in organized sports, such as the village soccer team, or in various school sports circles.

"We always played soccer in the large field on the edge of the village. For a while I used to play ping pong at school... There were several of us chums who used to go out on Sundays to the Keleti channel to swim and go boating. Occasionally we took a tent and slept out. We roasted bacon. Sometimes there were also girls with us and we cooked..."

Reading also appeared as a favorite method of spending free time for significant proportion. "I read quite often at home, nearly every day. I read 4 to 5 books a month, or even more. I had a friend who always recommended books. I read everything that was recommended or appealed to me. 'Tarzan, Son of the Jungle,' for example, I liked very much--how he grew up among the monkeys. Or I also liked the 'Jungle Book' very much; or 'Adventures on a Pirate Ship.'"

In the evaluation of the replies it is apparent that watching television was raised to the status of a favorite way of spending time by only one boy. But only 6 did not watch television on weekdays, and 12 on Sundays. Movies and television will also have significant roles later. In terms of

quantity, we may safely call these two the msot significant culture carriers. However, if we also consider quality, then the pciture which is common knowledge unfolds before us--the lowest level in everything.

Working at home should also be mentioned, since a large proportion of the students worked at home. It can be concluded from the replies that in most cases they realized the importance of the work, and of the income derived from it. The jobs, for the most part, involved taking care of animals, garden work, cleaning and chopping wood.

"Every summer I worked in the nursery. We planted and hoed. I worked not so much for the money, but rather so that I would not be bored at home. My chums always went also, so we had a good time together."

"I helped to chop wood and sweep the yard. I was always told what to do. I was happy to chop wood because I knew that it would strengthen me. Previously, I kept rabbits, and we had pigs. But I did not feed them because I always confused what I was supposed to feed them, the grits with the bran."

In examining the childhoods of the students, we may conclude that they had much more appropriate possibilities for spending their free time at home than at the hostel. They had more opportunity for play, for outdoor activities, and for spontaneous social intercourse. Although the selection of the rural libraries did not approach that of the college library, quite a few of them learned to like reading. Thus in these areas there was appropriate background for further progress. Cultural disadvantage appeared much more in the areas of the theater, serious music and the fine arts. Very many of the youths arriving in Budapest had never been to the theater, to an exhibit, and had never listened to a complete serious music composition.

Types of Activity at the End of the Second School Year

The vocational school hostel which the observed young people attended was founded in 1976 through the merger of three independent schools, and is located in a neighborhood of workers' hostels and suburban taverns. Its capacity is currently about 1,200, but there are plans to increase it shortly to 2,000. This will make it the country's largest vocational studen home. The area was previously very disreputable, and serious and minor crimes were frequent. The students were just as much at the mercy of the "tubers" [hippies] as of their stronger, more aggressive fellow students. It was hoped that order would be created in the area with the merger. It was also intended to raise the level of the training effort. The students are housed in three buildings which were originally built as workers' hostels. This fact has determined their "material" conditions. The 50 first year students were located on the third floor of the building designated "A". In the rooms there are 8 metal beds, 1 table, 8 chairs and 2 closets. The walls have been freshly painted, but the parquet has come

loose in many places to the extent of half the room. The wash basins and toilets are operable for the time being. It will take several months before they become stopped up and cease to function. By the time the cooler weather arrives, the windows in the lavatories will be broken, allowing the wind and the cold to enter.

The furnishings for each group consists of a study room, a television set, and perhaps a chess set or other parlor game. There are no club rooms, and the possibilities of playing sports are minimal. There are five groups on the third floor consisting of nearly 180 students. (In other places this is the total population of smaller hostels.) The impression of the initial days must be rather important for the days to follow. During the first few days here, beds are assembled, lockers are moved around, and carpets, curtains and bed linens are drawn. Everybody is giving orders, everybody is making demands. The rooms are rearranged several times--not only in the beginning, but during the year as well. No one can be sure of sleeping in the same location in which he slept today.

Ervin H. is a 31-year-old residence master. He has been working at the hostel for 2 years. Previously he taught at a rural school. "The child arrives in Budapest. Suddenly a multitude of regulations descends upon him and he is unable to discern the relationships among the rules. In general, the teachers and vocational instructors enjoy this defenselessness in the student--how he grasps at every straw, is astonished at everything, accepts everything that he is told and can be made to do anything. A short time passes, however, and he very rapidly discovers the teacher's blunders, and very rapidly discovers methods of evasion.

"In several months the child becomes completely without a master. Neither workplace, school nor hostel can provide him with concrete direction. I will risk stating that they do not even desire to provide it. In the rural surroundings they could easily grasp the situation and they knew the rules of the game. Now they are finding themselves in utter chaos. A good example is the situation at suppertime. Someone pushes in front of him in line and he does not dare to say anything. I saw a case where a puny youngster pushed into the head of the line and no one dared say anything to him because they did not know whose friend he might be. Their situation becomes completely obscure. From that moment on, the hostel does not serve them. Instead they become not only the hostel's victims, but those of the capital, the work place, and the school.

"We the residence masters should be creating order out of this chaos. Unfortunately, I discovered in these 2 years that in all areas of our training a complete lack of system is the rule. The chief principle is the change which can be statistically reported--there were so many theater attendances, library books or scholastic achievements. However, no one is interested in what is behind the data. Not only is it unimportant what method I used to convince my group to attend the theater, but even whether we really did attend! If it is noted in the work plan, in the workbook and in the competition notebook, then we were there..."

The size of the home requires factory-like direction: director, general deputy directors, deputy building directors, floor monitors and residence masters. Directives arrive in this way, and the initiatives which are "from the bottom up" proceed back in this manner. There is no viable self-government, and there is no hope for its formation. The function of the KISZ [Communist Youth Organization] is primarily mobilization for various demonstrations.

Our group began its life in the capital under such circumstances. The woodworking industry vocational students were the most fortunate among them. They stayed with the same residence masters for 2 years, and as much as circumstances permitted, managed to establish a certain "local" democracy. They went on many tours and managed to go to several theaters and exhibits. One half of the construction industry students also belonged among the more fortunate. They also had the same residence master for 2 years, and often organized theater visits and sports activities. The rest, when it came time for their second questionnaire, had been through several residence masters. The seed of their ties to the hostel had been extinguished. They spent their free time outside of the walls whenever possible.

During the week, house regulations permit very little time for various free-time activities. During the weekends, however, there is considerable free time. For the most part, during the week only the time between dinner and bedtime can be spent freely. During the weekends, however, complete lack of organization and supervision is the rule. Because of the unresolved evening head counting, there is no absolute necessity even to spend the nights inside. How are the youths managing with the partially restricted, partially lax, time possibilities? What habits, what needs have evolved within them during these two years-spent away from their families.

Sports activities were forced totally into the background in Budapest. The youngsters were separated from the sports organizations at home and have not yet found their way to the ones in Budapest. The only potholed handball court of the college is not able to replace the soccer fields on the village outskirts. In addition, college policy lays down conditions here--good scholastic achievements and exemplary conduct are required to play sports. Instead of stimulating participation in sports organizations, such participation is rather hindered. Play has disappeared from among their activities. Of course, maturing also had a role in this. During the more relaxed moments, however, the suppressed disposition to play breaks out vigorously. One parlor game placed in the study room, or one successful outing is sufficient for this. The number of those who like to read had decreased. Puttering around, primarily because of the lack of opportunity, has disappeared without a trace. The victor is the movie house. After the worn out films of the rural cultural center, dozens of movie houses await the youths, with their deluge of dozens of films. There are some who sit through three, four or even more films during a weekend. The enthusiasts are limited only by their pocketbooks, or perhaps by competition from television. Closely related to attending movies is the second most popular activity

type--doing nothing, loitering. There is also a certain positive side to loitering and roaming around. While doing this it is possible to gather impressions of the city. In any case, however, it can only count as a substitute activity. There is something infinitely depressing about a healthy 16-year-old young man who replies to the question of what he most likes to do in his free time by, "doing nothing."

It is sad how little sensible activity there is in their free time. During the week, watching television and reading are the chief activities. On Sundays, it is watching television again, followed by the movies, roaming around and doing nothing. Work performed willingly and with a sense of responsibility has disappeared from their daily agendas. However, several new activities, such as listening to music and recreation, have appeared. (By the latter we mean the coffee house, dancing, etc.) Thanks to the organized programs of the hostel, nearly all of the students have been to the theater and to exhibits. However, when we examine what is read, what theater performances are preferred, and what kind of music they listen to, we have little reason to be proud. It is apparent that our earlier conclusion is valid: the lowest level in everything. Only the woodworking industry group members managed to go to the then operating 25th Theater, and to the Academy of Music several times. Several of them went to the Bakonyoszlop reading camp, through the influence of their residence masters.

My second questionnaire contained a time study spanning a complete weekend. The previous observations were borne out. Those who remained in Budapest primarily went to the movies, watched television, and visited relatives. In contrast, those who went home helped with the household work considerably, and a good number of them visited public places of recreation.

Let us examine the weekends of several more closely.

Last Friday, George V. left school at 2 PM, ate lunch and went to the hostel where he "sat in his room" from 3 to 4. From 4 to 5 was a study hour followed by housecleaning. From 6 to 7 he sat in his room again. There was dinner at 7, followed by watching television. He went to sleep at 10. On Saturday morning he was at the movies. After lunch he visited his sister's home, where he ate lunch and watched television. He left at 7, arrived at the hostel at 8, watched a film on television and went to bed. Sunday morning he listened to the radio and record player at the hostel. Between 10 and 11 he played soccer. He ate lunch, then slept from 1 to 5. At 5 he ate the cold supper and went out to the movies. He came back at 9, lay down and went to sleep.

Ferenc B. also spent his weekend in Budapest. There was a study period on Friday until 6, after which he went to a disco and did not return until midnight. Saturday morning he was at the movies. In the afternoon from 1 to 4 he loitered around the vicinity of the nearby girls' hostel. He was at the disco again between 4 and 9. From 10 to midnight he played

cards with his roommates. Sunday morning he went to the movies. At 1 o'clock in the afternoon he met his girl friend. The following is noted for 9 PM: "I drank alcohol;" for midnight: "I fell asleep".

Tibor G. went home on Thursday night. Friday morning he went to the doctor for an excuse, although he was not sick. In the afternoon he went to Nagyhegy with his friends, then went to the club with them to play table tennis. He went home at 7, watched television and fell asleep at 11. He rose at 9 on Saturday, went to the sawmill, helped load a wagon with scrap wood, which was taken home and unloaded. He ate lunch at 12:30, went to the store, then went out to the woods with his friends to look for snakes. From 6 until 10 he again played table tennis at the club. On Sunday morning he watched television in bed. At 12 there was brunch. He went to the tavern for beer, then watched television again from 1 o'clock. At 4 o'clock he want to the field to play soccer. At 5, he and his friends went to the cultural center to see the film "Kuldetes," which they did not like and left in the middle. At the club they played records until 8, when he went home, watched television until 10, then read the book, "A Passenger Disappeared," until nearly midnight. He got up at 3:45 AM on Monday and rode the workers' bus to Budapest. He arrived at the hostel at 6, and together with his roommates ate the food he brought from home. When they were full they did not feel like going to work, so they went to the movies to see "Body in the Thames." He returned to the hostel at noon, lay down and went to sleep.

This same boy describes one of his Sundays spent in Budapest. "I rise at 7, eat breakfast and clean the room. Then I go to the movies, come back at noon and eat lunch. From one o'clock I stay in the hostel and either watch television or sleep. There is nothing to do so I lie in wait. The others return from home around 6. Then we begin to eat. We watch a film on television, go to bed where we fool around a while. Around eleven o'clock I fall asleep."

Sandor F. spent his weekend at home in Szabolcs Megye. Before he left for home on Friday afternoon, he visited his sister. He saw their new apartment and they chatted. At 6:30 he left for the hostel, packed his bag and left for the railroad station at 8. He bought his ticket, met his friends and they talked. The train left at 10 minutes to midnight. Soon he fell asleep, but around 1 AM a fight broke out in the compartment. One drunken boy stole his companion's money. The conductor called the police who took the drunken boy to the front and gave him a good beating. They arrived at Mateszalka at 7 in the morning. The next train left shortly thereafter and arrived at Tiborszallas at 8:30. He went home, ate breakfast and chatted with the family. He turned on the television at 9, but fell asleep during the program. He awoke at 3, ate lunch, listened to the radio and watched television. At 6:30 he went to the coffee house and met his friends. They went to a disco where he danced, chatted and drank a while He went home at 11, ate dinner and went to bed. He rose at 8 on Sunday,

watched television in the morning, then went to the coffee house at about 10. He ate lunch and listened to the radio in the afternoon. His return train left at 3:30 and arrived at the West railroad station at midnight. He went to the hostel and went to sleep. He rose at 7 and went to school.

Sandor P. also spent the last weekend at home. He arrived home at 7:30, dropped his luggage and immediately left for the neighboring village where there was a "party." "I socialized with the girls, and drank beer. Three of us left for home on foot at 1 in the morning. I arrived home at 1:45 and went to bed. I awoke at 10, listened to the record player until noon, then went to play soccer. At 3 I went to see the game on the field. Then we went to another village because that is where the party was. My girl friend also showed up and we stayed until 1 AM. I walked the girl half way home, we fooled around some, then I went home. I arrived home at 3:30, ate and went to bed. I had to get up at 5:30 to catch the bus to return. I arrived at the hostel at 8, and we ate. Then instead of going to school we went to the movies... (Together with Tibor F. mentioned earlier.)

The hostel, beyond giving the young people shelter is satisfied with apparent results. It cannot arouse the feelings of a home, cannot create communality, cannot aid in overcoming cultural disadvantages and cannot be the intermediary between the big city and the student.

The integration is not promoted by the institution, and assimilation is hindered by the city itself. The big city is like a magician who always shows only one side of his cape--the world of movies, display windows and subways. He who wishes to penetrate deeper is immediately enmeshed in the trappings.

My questionnaire asked three questions, with the aid of which I had intended to acquire a glimpse of their relationships with the city. Are you a member of a capital city--not hostel or school--sports circle, club or professional club? Do you have any friends in the capital? Do you have a girl friend in the city? Eleven percent replied affirmatively to the first question, 23 percent to the second, and 16 percent to the third. In analyzing the replies, however, it is apparent that these percentages are probably lower in reality. Most of the friendships do not amount to more than participation in a few mutual programs, and sports club memberships seems to spring from momentary enthusiasm. I found no example of lasting and deep friendships between genuine city dwellers and ruralites who live in the hostel. Similarly, serious love between a vocational trainee boy and a city girl develops only in the rarest cases. One of the cases of few visits to clubs and professional groups and the bypassing of sports clubs is the restrictive house rules of the hostel; others are fear of unfamiliar surroundings and lack of contacts.

We quote the views of several youths. Bela B.: "I don't know. These Budapesters appear to be very conceited. Perhaps the problem is with me,

but as far as I am concerned, they are conceited. They practically look down on us because we are from a village. They nearly ostracize us. Some are made fun of because of their speech, and we are baited in all different ways. I have a few chums at school. Sometimes we go to the movies or to look around. But I have never been to any of their homes and have never been invited."

Bela D.: "I have not yet had a Budapest girl friend... One needs a glib tongue for that, and maybe I cannot learn to turn a phrase like the Budapesters. Womanizing went better at home than here. We have been to discos a few times, but we failed there also. When we asked someone to dance, we did not know whether we would be attacked or not, since we are not very husky fellows. We asked a couple of girls to dance, girls who were not very attractive and whom we would not even notice at home. They were city girls and they said no. They did not say it, but they surely thought it. We could sense that they kept trying to get away from us... We are also looked down upon in class, even by the teachers. It is somewhat painful, but we do not care any more. All of the fellows have their programs, so it is not possible to make friends with them. Good friendship can be expected only from our fellow residents and no one else."

The road to the city and to the city dwellers--no matter how paradoxical--is found most easily through the subways. The difference between the country folk and the city dwellers are more easily blurred in the world of the "tubers". The recourse of withdrawal from society otherwise arouses feelings of belonging together.

Laszlo S.: "I came to Budapest, made friends with a couple of fellows on the Blaha and became a 'tuber'... I feel more comfortable with them than with anyone else also because of the solidarity, because what is theirs is also mine. There is an old man who has no relatives, and who is practically supported by the 'tubers.' Because of this, we can sleep at his place. Sometimes there are as many as 20 of us in his apartment, and at least 12 are women. These are tuber girls. Everything goes on there; drugs, sex, drinking--everything. In the morning I go to school and they go to the Blaha or to the movies. But if I should meet them anywhere, I am always invited along. If I have something to share, I also invite them. The good thing is that whenever I go out I always find someone I know. Right away time passes much more pleasantly."

One Year After the Skilled Worker Examination

Two more years passed. During this time, most of the students passed their skilled worker examinations and went to work. One significant event did take place, however, at the end of the second school year. The "B" building renovation was completed, and the complete renovation of "A" building was begun. The students were divided into two groups. The "good" trainees were moved into the newly renovated building, while the "bad" ones went to the

even more unfavorable circumstances of the "C" building. The same selection method was also used for the residence masters. Thus two camps emerged--the elite, well behaved group, and the remainder who showed poor performance in everything. Those who ended up in the "C" building felt that the discrimination was prejudicial, and during the remaining year did everything to validate the judgment made about them. (The residence masters certified themselves by doing nothing, and the students by breaking the already lax rules by fighting, stealing, and in several cases, by more serious criminal acts.) In the "penal colony" where approximately three quarters of our 50 students ended up, all earlier accomplishments were quickly destroyed. Although a few of them tried to maintain their relationships with their previous residence masters by going on outings and to the theater with them, the majority were lost in the vacuum which resulted from disorganization and negligence. Those who went to the renovated "B" building also fell into a trap. The autocratic leadership there nipped individual initiatives in the bud, and the strict house rules encouraged them to seek their individual well being outside of the hostel walls.

Under such circumstances all of them looked upon the skilled worker examination as salvation. In the "C" building such wild enthusiasm was manifested that several 10,000 forints worth of damage resulted. (Shattered lockers, window frames hurled out and broken up wash basins.)

The institution did not assume even a nominal responsibility for assisting with the problems of finding and beginning employment. The goal and the practice was to rid themselves of the trainees as quickly as possible before they did any more damage. If the students were not aware of it earlier, they most certainly now realized the fundamental truth here: the hostel is not operating for their good, but rather needs them only so it can operate. (One of the reactions to this realization is the annually recurring destruction, from which, strange to say, no one is drawing the proper lesson.)

Our young people may choose from among the following possibilities; they may remain in Budapest and move into a workers' hostel, or they may go home and accept the disadvantages deriving from the more limited employment possibilities there. I sent the third questionnaire by mail and received only 22 replies. Of these 22, only 7 went back to work in their villages or in their vicinity. The rest all accepted employment in Budapest. Four commute daily to the capital from distances of 30-60 kilometers. Three are living with relatives in Budapest. One is renting a room. The majority who remained in Budapest have ended up in the workers' hostels.

We may read many works about the life and double life in the workers' hostels. (Katalin E. Csaplar, 1976; Sandor Veres, 1979, etc.) Those who were sent to the hostel because of family problems are also in unfortunate circumstances, since they have now returned to the still unresolved problems.

The parents of Laszlo J. were divorced when he was still small, and his mother raised him by herself. While the boy was studying in Budapest his mother remarried. Laci now feels that he was manipulated and pushed out of his previous position. "My family problems were not only not resolved, but have become more complicated. Mother had a heart infarction because of the quarreling. I am not on speaking terms with my stepfather. I cannot find a position in my profession here, so I am working as a worker's helper. I do not want to move back to Budapest because that would be a victory for my stepfather. He very much wanted me to leave home. We even got into a fight. I have not been successful in any of my endeavors. I could not get a position in my field, and I could not adapt to the life here. I am now living without a purpose..."

The parents of Istvan L. were also divorced. Pista first worked in Budapest, but could not stand the workers' hostel for more than two months. He moved home. Soon thereafter he had a quarrel with his mother. Since then he has been "floating" among his three sisters. "There is always some problem. I just get out of one and step into another. Right now, for example, I am completely vulnerable. No one is taking advantage of me here, but no one helps me either. When I have a problem I have great difficulty in even finding someone to listen, let alone be interested in it. I have no ties, I just subsist. Every day I go where I think it is best for me. It is not a question of my going crazy, but rather that I discover something new every day. I do not know why all the new things are the way they are, and what their sources are. Perhaps my eyes are just beginning to open..."

My last questionnaire contained several questions pertaining to the feelings with which they are looking back on the hostel, and how good they consider the work being performed there. Unfortuantely, most of them gave standard replies such as better food, hot water more frequently, more frequent outings, etc. Similarly stereotyped replies were given to the question of what kind of advice they would give to the current freshman--whether he should listen to the residence masters, whether he should try to adapt, etc.

The replies of two young men, however, are thought-provoking. The previously quoted Istvan L. writes: "He should observe the atmosphere for 2 to 3 months. During that time he will discover what, where and when something can be manipulated in such a way that no one is harmed while he himself benefits." Another young man, Marton R. writes: "At first I would inform the freshman of the hostel requirements. Later, however, I would tell him that it is not necessary to observe the regulations, but rather that he should get in good with his residence master."

And how did the spare time activities turn out "out in life?" The life styles of those in the workers' hostels changed the least. They are working, living and engaging in recreational activities with people of approximately the same disposition. The youth who comes home from work tired watches television, goes to the movies, perhaps goes to the hostel club, or simply lies down on his bed to rest. Those who went home to the

villages of their parents are continuing their childhood pasts in many respects. They help around the house, they watch the soccer matches on Sundays, then they drink a few mugs of beer. In both groups a sobering up, a growing up is characteristic. The loitering and doing nothing have disappeared. At the same time, the desire to "be outdoors" has also ceased. For many the period of frugality has already begun, wherein they are placing their salaries and the income from occasional work into savings accounts. For several the thought of establishing a family in the near future is already present. Dancing, recreation and dating have come to the forefront. The love of reading has declindd further, and there is no longer any trace of attendance at the theater or at exhibits.

Ferenc V. learned the insulation trade and lives in a worker's hostel. He describes his life: "In the hostels we went to the theater, but somehow that has stopped now. I do not feel much like going alone. I do not want to go in blue jeans so I have to get dressed up, and I have to straighten myself up. I consider a performance, whether I will like the play or not, because I am unfamiliar with it. It is no use asking my fellow workers because they know less about it than I do. I may go to see the play and not understand it. Who can I ask what it was trying to convey? The same situation exists with outings. I had good friends at the college. Together we decided to go towards Csillaghegy. So we hiked for a good while, made a fire and roasted bacon. We enjoyed ourselves the entire day. I miss this. I even tried to convince the brigade at work to have an outing. I organized one to the Danube curve. What happened? The ticket was purchased so it could be posted in the brigade diary. Of the 30 only 7 went. The seven, in truth had a good time--by evening they were drunk! We went up to the fort, looked around, then--up and into the tavern! Then one more mug, then another! We barely made the boat...

The friendships in which everyone knows everyone else do not exist at the hostel. I go into the club. If there is a vacant seat at the card game I ask if I can sit in. Then I play an hour. In general, I listen to the radio, or I read. Recently I discovered mysteries, but occasionally these bore me also. After 50 to 80 pages I can generally figure out who the murderer is. I check the ending. If the murderer is who I think it is, the book no longer interests me..."

Istvan Sz. went home to his village after his trade examinations. He married and moved in with his mother-in-law. "My work in KTSZ [Artisan Cooperative] lasts until 2 PM. Then I take my time in packing my belongings, get in my Trabant and go to work, or rather go to work for myself. Sometimes I work until 8 or 9 PM. Then I go home, take a bath and forget my tiredness. I eat dinner with my lovely wife, she relates the events of her day, then we go to sleep. Sundays are the same. I would rather not work on Sunday, but when one starts to work on his own, the clients are always in a hurry for the jobs. My wife also works often on Sundays,because she is a nurse. Thus we rarely have a whole day together. Sundays are not like they were at home when I was a child. On Sundays dad used to climb into bed with us and fool around. Even the radio sounded differently when I was a child..."

KSS 'KOR' DECLARATIONS ON MEAT PRICE INCREASES, STRIKES

KSS 'KOR' 11 July Declaration

London DZIENNIK POLSKI in Polish 26 Jul 80 p 4

[Text] Warsaw, 11 July 1980.

On July 1 a major price rise on meat and smoked meat products was instituted without reporting this fact to public notice. On July 2, the deputy chairman of "Spolem" [Central Union of Consumers' Cooperatives--CZSS] on the TV news gave information about the rise referring, however, to a much narrower range of products than that of a day before. On July 4, work establishment cafeterias and some stores in many areas of Poland were returning to earlier prices on nearly all articles that had become more expensive 3 days before. In other parts of the country, cafeterias and stores kept the new prices unchanged. Subsequently, to this day, price fluctuation has continued. For example, new prices were introduced on July 1 in the Warszawa steel mill cafeteria. Old prices were in effect between 10 o'clock and noon and new ones between noon and 2 pm on July 3. At 2 pm on July 3 and throughout July 4 the old prices were in force, and since July 5 to this day the new prices have applied. On July 9, an advisory session of party and economic activists was held on July 9 in Warsaw. The price rise was announced to be maintained, although in a narrower range than the "Spolem" deputy chairman's statement seemed to indicate (two kinds of meat, slab bacon and some kinds of poultry and canned meats). An announcement was made that so-called old-portfolio retirement would be increased next year along with substantial increases in family allowances and lowest earnings. The authorities withdrew a price rise, introduced it again in limited form, and promised higher wages--all of this under pressure from worker protest and demands supported by threats of strike and strikes. At this time, we have information about strikes in 14 work establishments (Warsaw steel mill, FSO passenger car factory in Warsaw, Ursus mechanical factory near Warsaw, WSK Mielec, WSK Swidnik, POLMO Tczew, ZELOS in Piaseczno near Warsaw, ZELMOT in Warsaw, Rzeszowski Kombinat Budowlany W Dabrowie Gorniczej, the meat plant in Grudziadz, department K1 angle shop at the Gdansk shipyard, the Roza Luksemburg factory in Warsaw, TOMED in Poznan, the rolling mill plant of Cegielski

factory in Srem. In five work establishments, demands were made to withdraw the price rise, in eight, higher wages were demanded and in one (FSO), demands were placed for higher wages and lower prices. In all places where higher wages were demanded, the managements promised a raise. Workers' commissions were established in three departments of the Ursus mechanical plant and written guarantees were obtained from the management that no one would come under repression for participation in the strike. The Ursus work force demands a regular cost of living supplement. Strike actions continue all over the country.

We stated in our declaration of July 2: "The KSS 'KOR' is in full solidarity with the strikers and sppports their demands. We put especial emphasis on our support for the cost-of-living supplement proposed by the strikers. The most effective and nationally the least hazardous form for the workers' insistence on their own and the nation's interests in by becoming organized in their work establishments, democratic elections of independent worker representative bodies to advance demands on behalf of plant crews, conduct discussions with the authorities and guide crew actions in a responsible yet resolute manner. Plant crews must become aware that solitary action alone can bring positive results. Above all, the authorities cannot be allowed to initiate any persecution whatsoever of strike participants and persons who indeed are, or are imagined by the authorities to be, leaders of worker protest."

A heedless investment policy followed by the authorities in the 1970s and an agricultural policy that caused a critical situation in farm produce supply combined to produce a veritable economic disaster. A factor of importance is also the price system, in force for several decades though incorrect and incompatible with economic laws. Yet this price system can be remedied only as part of a radical change of the entire economic system which is unreasonable, wasteful, inhibitive to progress and ruinous to employee morale. The workers are charged with poor performance, rampant loafing and underutilization of work time. These things happen, however, not because people do not want to work. The reason lies in the economic system itself and in its incentive system. The workers are not responsible for shortages of raw materials or stoppages in factory work caused by electricity cutoffs. The PZPR tries to burden society with responsibility for the party's own mistakes, incompetence and incomprehension of economic processes. A price-system modification can be accepted only if it comes as one among minor measures in a sweeping economic reform. Admittedly, the fundamental cause of the crisis is the Polish authorities' policy of many years under which decisions are made outside of society and economic reforms are replaced by provisional measures. All adverse consequences of these measures are suffered by the people, especially the poorest segments. It is imperative immediately to undertake energetic steps necessary to salvage the country from disaster.

1. The economic system and decisionmaking mode in matters concerning society as a whole must undergo a drastic change. The KSS "KOR" provides

no statement on the directions of such reform. We are convinced that these can only be determined by a nationwide decision. It will probably take account of reform proposals drafted in recent years by independent social institutions. There should be also a clearly defined governmental reform program with a published schedule of implementation. Otherwise, the authorities' temporary measures will meet with ad hoc response actions of particular segments of society.

2. Because current tension is directly caused by the market situation in foodstuffs, mainly meat, the policy ruinous to family farms, chief producers of food, should be instantly discontinued. Private ownership of and freedom to sell and buy land should be guaranteed. All forms of farming: family farm, cooperative farm and state farm must be treated as equally legitimate in the area of supply, sales, pricing, credit, taxation and legal protection. Private farmers should be allocated a substantially greater, justified, proportion of fodder concentrate and other means of production supplied to the agricultural sector.

3. Until the change in farm policy yields desired increases in food deliveries to the market, and if government authorities are unable to insure supplying consumers with meat available in stores at regular prices, commercial prices should be abolished and a universal meat rationing system should be instituted, that is, with ration cards and at prices prior to 1 July 1980.

4. It is necessary to publish complete data on the economic situation, in particular, on Poland's debt, and on the meat balance (total production, consumption by individuals, collective consumption and foreign trade).

5. It is of utmost importance that the discussions and negotiations we are facing be held with composure and their results be an expression of the position of all segments of society. The authorities must be made to understand that they will not evade negotiations with the people. To a certain degree, it is up to the authorities, however, whether these negotiations proceed in peace or in a climate of aggravating strife.

True to its goals, the KSS "KOR" calls for attention, above all, to the need to restore fundamental civil rights. They were guaranteed under the Human Rights Pacts which are in force in People's Poland. The authorities' compliance with these rights will create possibilities for reaching consensus on most urgent economic, political and social reforms. Employee rallies should be enabled to establish worker commissions, employee commissions, independent labor unions and other representative bodies which would be able to defend employee interests. It should be made possible for citizens to become organized to fight for their rights and to advance and implement initiatives geared toward society's good. To make this easier, the act on assembly and association should be altered. The Labor Code should be changed, particularly, Article 52, Section 1, should be repealed as it

provides for discharge from work for participating in a strike. The right to strike should be legally guaranteed.

Conditions must be created for nationwide discussion of the country's situation and on how to escape from it. Aside from purely economic factors, one of the principal causes of the present economic situation is the gagging of society by censorship and the state monopoly on mass media: the press, television and radio, which permits an artibrary and myopic ban on the voicing of genuine opinion current in society and even on pronouncements of experts if regarded as inconvinient. In this manner, both the public and the authorities are deprived of any control whatsoever over the country's situation, while persons cognizant of economic and social life can reach neither the authorities nor--no less important--their fellow citizens with their views and reform proposals. Retention of this status quo prohibits discovery of ways out of the impasse, thus enormously multiplying the risk of a disaster. Access to mass media should, therefore, be allowed to independent experts, views of employee groups and independent organizations should be made public, and prosecution of independent publications and periodicals should be discontinued. In the overall national interest, preventive censorship should be abolished and a press act should be introduced specifying the mode of courtroom protection of military secrecy and of the interests of private individuals. Repression of persons involved in independent social and political activities should be discontinued. Authority of the Citizens' Militia and Security Service should be reduced. The courts should have their autonomy restored to them. Political prisoners should be released immediately.

Above, we have specified the minimum requirements formulated for a long time that must be met to make possible a nationwide debate of the present situation and to reach consensus between the people and the authorities.

The KSS "KOR" appeals for support of these postulates by all of society and especially by work crews who will be able to submit them in the course of impending negotiations with the authorities. We should not be appeased with a partial withdrawal of a [price] rise or partial compensation won by major plants only. Such concessions will not improve the national existence especially in the most impoverished segments. At issue here is not only the maintenance of a tolerable standard of living; it is of exceptional importance to restrain the process of decay of state and society. The authorities; irresponsibility does not release us all from responsibility toward our country.

In keeping with its goals, the KSS 'KOR' will provide assistance to all those suffering repression for taking part in strikes.

Account by Dissident Strike Participant

London DZIENNIK POLSKI in Polish 26 Jul 80 p 4

[Text] A special issue of ROBOTNIK, published in early July, contained an account by a KSS "KOR" associate participating in the strike at Ursus, along with the July 2 KSS "KOR" declaration promptly reported by daily newspapers in the West.

Below we print the above-mentioned strike participant's account in full and a complete text of the 11 July KSS "KOR" 11 July declaration.

The strike at Ursus mechanical factory began on Tuesday July 1. Second-shift workers went on strike in several departments, the immediate reason being a rumored price rise. Tension mounted because of the lack of official information. There was no meat in the plant cafeteria on Wednesday. Other production divisions successively joined the strike on that day and on the following day. Work continued at all times only in two departments: the casting plant where the furnaces can be destroyed if abruptly put out, causing lossess that go into millions, and the electric heat and power generating plant supplying energy to the town and factory. The course of events on July 3 had a similar pattern in all production divisions. The employees would halt work, disconnect their machines, and form groups in their "nest areas" to start preparing their demands. The scope of the strike gradually expanded, with some management representatives and PZPR activists taking action. They approached worker groups with appeals to resume work, referring, in the case of party members, to their party consciousness, all in vain. Certain activists were exceptionally active. Master foreman Krasniewski from the chassis department threatened his subordinates with recourse to a prosecutor, and master foreman Piowierz from the engine assembly department with disciplinary dismissal. At the same time, the management took steps to isolate the strikers by cutting off all outside connections to the plant and locking gates in individual divisions. Telephone cables were disconnected so that the divisions were unable to communicate with each other.

The strikers in the PS engine assembly department elected a 10-person delegation. The PB chassis department elected 20 men to their delegation. The workers of the PR repair and power department organized a strike meeting, wrote down their postulates and elected a seven-person strike committee. The management attempted to take control of the situation by organizing briefings for master foremen, brigade leaders and shunters who were then to appeal to the workers to resume work. As this produced no results, the management and department chiefs began discussions with the delegations or whole crews. Initially, the management seemed to believe that it would be enough to inform the employees that workers in the West are even worse off and give vague promises of a raise of from 1.09 zlotys and up for those who merit a raise. In most departments, the second and third shifts joined the strike.

The strike was continued the next day. The situation developed somewhat differently in the PR department where an efficiently operating strike committee put forward the strikers' postulates in writing: 1) to increase the hazardous (work supplement) from 0.5 zloty to 1.50 zlotys per hour; 2) to add 10 percent for second shift work; 3) to increase wages so as to compensate for the price rise and to introduce a regular supplement for the growing cost of living. The management was given 2 hours to consider these demands. When this period had elapsed, the plant manager, first secretary of the local party unit and department chiefs appeared. For starters, threats were offered as usual. The secretary said that employees are not irreplaceable and they had better remember that. In response, the workers added to their postulates a demand for a written pledge that nobody would be persecuted for participating in the strike. The manager promised to present their demands "on top" and called for resumption of work. Because no one budged, he pointed his finger at workers he was familiar with and appealed to them by name. This was a crucial moment. Nobody broke down, and it became clear that the strikers were bound to win. The management promised to respond to the damands in 2 hours. It was the management's wish to have the strike committee change its name because of the ill-sounding word strike. The strikers agreed for their representatives to use the term workers commission during negotiations. While awaiting the response, preparations got underway to halt work in the power plant. The forge shop manager was warned to terminate technological processes on time because power supply would be interrupted. Two hours later, acting director in chief Szymczak arrived with the plant manager, party secretary and someone unknown to all strikers. The discussion resulted in the management's pledge to fulfill demand No. 1 and demand No. 2 in a week's time, and demand No. 3 by August 15. Written guarantees that there would be no repression for participation in the strike were denied. The strikers voted not to end the strike until such guarantees are obtained. The management yielded at 4:30 pm.

The next day, on July 3, director Szymczak again came to the factory and affirmed that all the demands would be fulfilled and increased wages would cover the period beginning 1 July.. Bonuses for piece-rated work would be additionally increased by 10 percent. Union employees would be paid according to schedule V (a raise of approximately 400 zlotys). Additionally, a 5-percent bonus and permanent master foreman supplement were granted. On the same day, the management began negotiations in other departments. In the PS department, the management made a decision about wage raises beforehand, in an effort to avoid a meeting with the workers' delegation. That decision was transmitted by master foremen, brigade leaders and shunters. The workers received a 10-percent bonus and a 150-zloty master foreman discretionary allowance. Meetings with the workers were held in the PB and PC departments. The raises were similar to those in the PS department. The PB department additionally achieved replacement of schedule III by schedule IV. Extra concessions were also won in the PC department. Soon after, actions were taken in all the departments to resume work.

Meat Price Increases

London DZIENNIK POLSKI in Polish 26 Jul 80 p 4

[Text] (This article was published in the 14 July 1980 special issue of the KSS "KOR" periodical "GLOS" in connection with a wave of strikes in Poland.)

The meat price rise was ushered in through the back door. The authorities are now retreating from it under pressure.

The strikers are receiving wage raises. Those who cannot strike, retirees, pensioners and employees of small plants are forced to accept higher prices. This is what the authorities are counting on. They hope that society at large would be successfully saddled with new prices and the whole scheme would pay off on balance. This policy of intimidation, understatement and conman cleverness has no chance of success. The confusion resulting from differing prices being in force will cost the economy more than the raise was expected to yield. Bonuses for strikers, rather than comprehensive political and economic solutions, promise frequent recurrence of the strike wave in the next few months. The present status is, however, better for the authorities than reforms would be. It is a logical continuation of the present mode of governance. The Gierek strategy was based on Western loans upholding the communist system of management and governing unchanged.

Today, with no loans in sight, everything is crumbling. What will come next? What will the new crisis bring to Poland?

The authorities want no reforms. No wonder! The communists bear the sole and total responsibility for the present status quo. For 35 years they have ruled above the people's heads and counter to the people's aspirations. Meantime, they ruined agriculture, vital for the country's food supply, they destroyed the crafts and service sector, and disorganized industry by commanding it from behind their Central Committee desks. It is hard to assume they would again be given a credit of trust. At this time, there is no possibility for resolving the crisis unless society is allowed into power.

The workers are not demanding reforms but wage raises. This is understandable: reforms have been promised many a time and each time they proved to be the most meager. Unless the present ruling system is changed, we will remain stuck in a vicious circle.

For this reason, the workers bear a tremendous responsibility at this time. They hold the country's fortunes in their hands. Much depends on what they will be able to win today. Much, including Poland's regaining her independence in the future. Let us not delude ourselves: regaining independence is impossible for a weak and disorganized country whose society divested

of every right, can only rebel, but cannot cogovern. This is precisely what we have to recapture today: the capability to cogovern.

The KSS "KOR" formulated postulates for imperative changes in its 11 July declaration.

First, the situation in the meat market must be stabilized. If it cannot be achieved otherwise, a rationing system should be introduced with meat prices prior to July 1 and commercial stores should be eliminated.

Publication of complete data on the country's economy and a prompt end to the destruction of private farming are imperative.

Subsequently, a nationwide discussion should be initiated on the solutions to the present critical situation and the shape of an economic system to bring it to health--even if at the price of immediate expenses.

For this to become possible, fundamental political guarantees are indispensable: freedom of association and strike, freedom of the press, restoration of the rule of the law by curtailing authority of the Security Office, and warranting autonomy to the courts. Reforms will be impossible without these guarantees. A renewal program can be realistic if the nation proves capable of forcing guarantees for the rights listed above.

At this time, the authorities have no program other than continued reduction of the standard of living, but the domestic situation can induce them to make political concessions if social pressure is sufficiently strong.

The timeserving policy pursued by the authorities thus far is increasingly costly to all of us, but concurrently, it gives us a spell and an opportunity to organize independent labor unions and other representative bodies of the people.

Similar opportunities do not come about too often. We will achieve only as much freedom as we win in struggle.

LESZEK MOCZULSKI INTERVIEWED ON OPPOSITION IN POLAND

Vienna PROFIL in German No 34, 18 Aug 80 pp 26-27

/Interview with Leszek Moczulski by Peter Stein: "It Will Be a Hot Autumn"/

/Text/ PROFIL: Are you not afraid to give us an interview ? Do you not fear the consequences ?

Moczulski: One can get used to anything, including going to jail. When you have been arrested 18 times in 6 months, one more arrest makes little difference.

PROFIL: For the past 4 years there has been talk of a Polish opposition. Can you provide some specifics: how strong is the movement ? What kind of a movement is it ? Is it socially oriented or politically oriented as well ?

Moczulski: In a totalitarian system like Poland's more or less everyone who is independent of the source of power is in the opposition. For instance, Stefan Olszowski, who was a member of the Politburo until a few months ago is a member of the opposition now that he holds the post of ambassador in East Berlin. The same holds true for Piotr Jaroszewicz, the former prime minister. But what you are interested in is the free, independent movement in Poland which has become very active in recent years. Essentially, this movement is made up of three different groups. The first of these is the intra-party opposition which goes under the name of "experience and future." It consists primarily of party intellectuals. They accept the party as the leading power in Poland and believe that the right solution for Poland lies in minor intra-party changes. They reduce the difficult situation in Poland to economic factors alone. This is enough of a reason for their being unable to bring about any change in Poland, however slight.

The second group includes large segments of the intellectual community --scientists, journalists, writers-- most of whom have existed in a kind of symbiotic relationship with the party over the past 35 years. This relationship afforded them the opportunity to publish books and articles, to do scientific research and officially take the title of intellectuals. This is the way it is in a country where not even a foreman can be appointed without party approval. The most important man in this group is Jacek Kuron, a member of the KSS KOR (the Committee for the Self-Defense of the Workers). All members of the group are in favor of far-reaching socio-political reforms in Poland, but within the framework of the existing system. One could charaterize them as Polish Dubceks.

The third opposition group in Poland, which is the largest, is led by me and is called "Confederation of Independent Poland." Our main goal is to achieve independence for Poland. In contrast to the two other opposition groups, we categorically reject communism. Communism is foreign to and hostile to Polish tradition, mentality and interests. We are opposed to the Polish CP as an instrument of Soviet domination in Poland. But this does not mean that we wish to achieve our aims by force with the help of a revolution or insurrection. We are for a "revolution without revolution," which means that we are working quietly step by step to reach our goal. Between them, the second and third group of the opposition have about 15,000 members. In a country of 35 million inhabitants, that is not much, unfortunately.

PROFIL: There are strikes all over Poland. It is often said that there are social reasons for them. Are they politically motivated as well.? What is the extent of opposition control or even organization of the strike wave ?

Moczulski: At the moment, there are strikes taking place at 150 Polish factories. In about two-thirds of these plants our people are participating, but in no case have we joined in on organizing the strikes. As it happens, this most recent wave of strikes in Poland is quite spontaneous. Without a doubt, the situation was brought on by the price increases. But it would be wrong to think that the strikes are merely socially motivated. That is what the Polish rulers believe and they also believe that economic reforms can take the place of political reforms. But they are totally wrong. It is true that we do not have enough meat and food as such; but what we miss most of all is democracy and the feeling of being masters of our own house.

PROFIL: 10 years ago, strikers were fired upon in Poland; 6 years ago, they were merely arrested. This year, there are strikes throughout the country and the demands of the strikers are being met. What is the reason for this difference in approach ?

Moczulski: There are two reasons for the authorities yielding-- based on domestic and on foreign policy considerations. There is a military force in Poland numbering one million men whose sole purpose it is to hold down their own dissatisfied people. Theoretically, this force is capable of stamping out the opposition in a matter of a few hours and to re-establish complete control over the situation. But this raises the question of the foreign policy consequences of such an action. It is an open secret that all East bloc countries are living off credits from the West. They are borrowing more and more money all the time. Just one year ago, Poland had to obtain Western credits to the tune of $ 5 billion and this year the Polish economy must have $ 8 billion to keep from collapsing. At least that is what the official estimates by Polish economic experts come to. In addition, there are the Russian needs for dollars. As a consequence of the invasion of Afghanistan, the Russians themselves are almost unable to obtain Western credit or Western technology. So, if the Polish strikers would have been dealt with as brutally as in 1970 and 1976, the last hope for Western aid not only to Poland, but also for Russia would have been lost.

PROFIL: Do you mean to say that the dollars are going to Russia by way of Poland ? Is there any proof of that ?

Moczulski: That is the way it is and it has been throughout Poland's post-war history. Since the start of the Afghanistan crisis, the situation has gotten more acute. The strikers themselves found proof when they opened up refrigator cars in Ljublin which were destined for Russia. Poland has always been a transit point for Western goods and technology going to Russia. This also applied some years ago to the German war reparations: steel pipe was transshipped directly to Russia and used there for the construction of a pipeline.

PROFIL: In case there should be an uprising, are you afraid the Russians will intervene as they did in Hungary in 1956 and in Czechoslovakia in 1968 ?

Moczulski: The Polish government is spreading this very story in the West, particularly in the United States and in the FRG. It says that an uprising is imminent and that the Russians would intervene with armored units in case it took place. This, it says, could have catastrophic consequences not only for Poland, but for the whole world. The Polish army and the population would certainly fight against the Russians. Logic therefore requires the West to extend even more economic help to Poland. But this line of argument is politically faulty. The fact is that the Russians do not need to bring armored forces into Poland; they have been stationed inside the country since the end of the war. The Russians have no economic or political interest in military intervention, at least given the present situation. They need a respite now in order to deal with their own national, social and domestic problems. They are involved in all of the Asian conflicts-- in Afghanistan, in China, Vietnam, Korea, Cambodia, Iran etc. They need to have peace and quiet in Europe. There is a great deal to lose here. But, if there should be a Soviet military intervention, it will have a bloody and tragic ending-- not only for Poland.

PROFIL: Is there any other way open to the Russians to control the situation in Poland aside from using tanks and intervening militarily ?

Moczulski: Of course. The Polish CP is the surest instrument of Russian control over Poland. In a sense, Russian reaction to the strike wave in Poland has been evolving for several months. Thus, official circles are now discussing the possibility of legalizing the strikes. The Russians, that is, have learned in the meantime that liberalization is more likely to produce results than military intervention.

PROFIL: Do you mean to say that further strikes may actually bring about a significant democratization ?

Moczulski: Yes, and this we consider to be our most important task. We must force the rulers to yield in those fields which are of the greatest use to the people. I am certain, for example, that censorship in Poland will be abolished in the coming months. Our most important aim, however, is to set up independent works councils in all factories. Ultimately, there should be a network of independent labor unions in Poland. That is, as I mentioned before, our way of making a "revolution without revolution."

PROFIL: Recently, there has been talk of a young generation in Poland. The names of Olszowski, Zabinski, Kurowski, Ciosek are being mentioned. Do they stand a chance of taking over the posts of the present party leaders ? Can they bring about any changes ?

Moczulski: First of all, this "young generation" is not all that young-- practically all of them are over 50. Even if they did assume power, they could not change anything. The main problem all East bloc countries face is that there are no young up-and-coming politicians. There are no real personalities, due in no small measure to faulty, communist education. Every Polish prime minister invariably turned out worse than his predecessor. Compared to his two predecessors, the present one appears ridiculous. Every succeeding party chief turns out to be more of a political primitive. Edward Gierek, the present one, is no more than a civil servant, who does not have the faintest notion of politics.

PROFIL: Are there any real personalities among the opposition ?

Moczulski: The opposition consists almost entirely of real personalities. But in the present situation, there is no point in coming up with personality alternatives. Things have not progressed that far as yet.

PROFIL: What are the prospects for the immediate future of Poland ?

Moczulski: It will be a hot autumn. The strike wave will spread. If the government yields by moving toward democratization, economic conditions will also begin to improve. We know that we have to tighten our belts. We are prepared to do so because it needs to be done. But the price we ask is democratization.

ITALIAN CP OFFICIAL STRESSES COMMON VIEWS WITH RCP

Bucharest LUMEA in Romanian No 35, 28 Aug 80 p 8

[Interview with Giorgio Napolitano, member of the Direction and secretary of the Central Committee of the Italian Communist Party, by Florin Velcu: "The Romanian and Italian Communists Share Numerous Common Positions"]

[Text] [Question] During your visit to Romania you met with the secretary general of the Romanian Communist Party, the president of the Republic, Comrade Nicolae Ceausescu. What can you tell us about this meeting?

[Answer] This meeting is part of a periodic exchange of information between our two parties. It was devoted, in particular, to international affairs and to the activities of the two parties. We noted a common concern for the threat which is being manifested to detente and peace while, at the same time, agreeing that the possibility of reducing tension has also appeared. We were in agreement on the need for initiatives, for a movement of opinion in favor of an East-West dialogue which would promote the solution of serious problems which remain open and serve as causes of tension and conflict, which cannot help but alarm us today.

[Question] We would like you to discuss RCP-PCI [Italian Communist Party] relations, a topic discussed during the talks.

[Answer] These relations have been very cordial for a long time and the meeting with Comrade Nicolae Ceausescu represented a confirmation of their excellent status. Our party and the Romanian Communist Party have taken similar positions--for example, when we considered that the Paris Conference was insufficiently prepared for and not organized in a satisfactory manner and we decided not to participate in it; at the same time, the two parties stressed that participation or failure to participate in a meeting does not and should not influence relations among communist parties. I believe, in this sense, that relations between the Italian communists and the Romanian communists are developing in a positive way because the two parties feel, to the same extent, the need to act outside all rigid schemes for the relaunching of detente. There has been intense international activity on the part of the PCI and, as always, there has been intense international activity

on the part of the RCP and on the part of President Nicolae Ceausescu, personally. He has had numerous meetings and contacts with representatives of various movements, parties and governments.

[Question] How do you characterize relations between our states, Romania and Italy?

[Answer] It seems to me that, in general, interstate relations, economic, commercial and cultural relations between Italy and Romania can be evaluated positively and I would like to point out an interesting fact. Recently, the secretary of the Christian Democratic Party and a delegation from this party and also the secretary of the Italian Socialist Democratic Party were in Romania to meet with Comrade Nicolae Ceausescu. We view this as positive, regardless of the political differences which our party has at this time with the Christian Democrats and with the Socialist Democratic Party; we are clearly in favor of the developing of all useful contacts for a policy of better understanding between Italy and Romania and, in general, for a policy of detente.

[Question] A final question: What is the position of the PCI toward the coming meeting in Madrid?

[Answer] We consider that this meeting has profound significance and that its importance and value might exceed all expectations because it is taking place at a time of very serious international tension. We believe that great attention should be given to the orientation of the proceedings of the Madrid meeting; that it is necessary, in particular, that there be a correct defining of its mission so that a rush of too many topics and too many demands can be avoided. At the same time, I must note that a topic of great importance, in connection with which the meeting can serve as the occasion for very very useful discussions, is the subject of disarmament, of negotiations for the reduction of arms in Europe. We know that at the present time, a dangerous escalation of the nuclear arms race is going on in Europe; this tendency must be blocked and the path to negotiations must be opened up, especially in the matter of the so-called "European strategic weapons" or "European missiles." Therefore, we will work so that the Madrid meeting will make a concrete contribution in this area.

CONSEQUENCES OF POOR TRAINING OF WORKERS EXAMINED

Bucharest ERA SOCIALISTA in Romanian No 13, 5 Jun 80 pp 14-18

[Article by Andrei Gutan, sociologist at the Knitwear Industry Central]

[Text] The unprecedented powerful increase in our country's production forces, naturally, has great social implications, bringing profound changes to the structure of society. The massive investments made for the accelerated development of industry, transportation, agriculture and services are bringing the continual redistribution of the labor force between the basic branches of the economy as well as between the various branches and subbranches of industry. In such a vital context, a true "hunger" for a labor force with appropriate qualifications has been demonstrated and, in turn, this has caused the creation of varied forms of vocational training, starting with the higher educational institutions, specialized high schools and vocational schools and ending with the qualification achieved in the enterprises.

From the start it should be stressed that through the variety of training forms we are seeking to satisfy the many objective demands raised by economic life. This means adopting flexible methods and forms for training the worker personnel which answers the specific demands of everyday activity as fast and as well as possible.

Although in recent years great strides have been made in the direction of qualification for the labor force, a series of data resulting from the sociological investigations which I have made show that one of the important forms of vocational training, that is, the qualification achieved in the enterprise, does not in all cases correspond to current demands. And this is both with regard to the organizational framework as well as acquiring of the knowledge needed for the good development of production activity. This statement in particular has in view some branches and subbranches of light industry.

Wtih regard to the consequences, they have repercussions on the rapid integration of the new employees in the labor collectives and also on the stability of the worker personnel, thus causing disturbances in the enterprises' economic activity as well as large material losses.

I shall attempt to provide arguments for what has been stated above, proceeding from a concise examination of the content of the training and ways by which the qualification of worker personnel in the enterprises is carried out.

Defects in Training--A Source of Problems

The first aspect I am subjecting to attention is the quality of training for the new employees with regard to mastering the knowledge they need with a view to carrying out production activities. (In order to understand the following correctly and to clearly define the area of investigation, I must specify that the qualification in enterprises is for those categories of worker personnel whose training generally is between the 4th and 10th grade, excluding the graduates of the first step of the specialized high schools, and those who have not followed any other form of vocational initiation outside the enterprises.)

In 1979 I did research on labor force mobility; one of the variables under which the problem was analyzed was precisely school and vocational training. Approached from this perspective, the structure of the labor force analyzed is presented in this way*:

Table 1

Training	4th grade	7th-10th grade	Vocational school	High School	Post-high school	Higher Studies	TOTAL
%	12.2	67.9	9.4	9.3	.7	.5	100.0

(High school means any type of high school--general culture or specialized--while the category of 7th-10th grades means the general culture high school.)

The above table permits several important findings with direct implications for the enterprises' activity. The first finding is that the greatest portion of worker personnel--that is, 80.1 percent--is qualified in the enterprises. From here we see very clearly the special importance which must be given to this system of training.

A second finding is the fact that 12.2 percent of the personnel I have included in the research have school training of up to 4th grade, while the 67.9 percent actually includes the category of training between 4th and 7th grades, also. Thus, we have the conclusion that a rather large portion of worker personnel do not have a sufficient stock of general cultural knowledge when they come to the enterprise. Under these conditions, the later vocational training of these people in the enerprise will take place with difficulty, particularly if we bear in mind that, besides gaining certain knowledge and practical habits, the educational programs include the assimilation of theoretical concepts.

---

* The figures refer to the 7,384 workers in enterprises belonging to the Ministry of Light Industry.

This is because it is well known that the general level of training for students directly affects the level and quality of any instructional-educational process.

Especially under conditions of the current rapid technical progress, the lack of general cultural knoweldge hinders assimilation of educational programs specific to the qualification in various trades. One of the direct consequences of such a situation is the slow integration of the new employee in the labor collective, marked by difficulties in adaptation or even failure to integrate, given the fact that the result of poor vocational training is failure to fulfill the production quotas, with direct consequences not only on the individual wage but also on that of the colleagues, due to extension of pay by the job. Inevitably, these aspects unfavorably influence the interhuman relationships in the labor collectives (relationships between members of the labor collective, between heads and subordinates and so forth).

Proceeding from these types of findings, one may explain why, for example, the indicator of intensity of departures from the enterprises is 7.4 percent, while the indicator of intensity of actual fluctuation is 8.9 percent. The laborious development of the very process of integration as well as the various demonstrations of phenomena of lack of integration or even of rejection of the individual by the labor collective result from the analysis of seniority of the persons moving in the enterprises:*

Table 2:

Seniority in the enterprise	1-3 months	4-6 months	7-12 months	1-3 years	4-6 years	7-10 years	More than 10 years	TOTAL
%	20.3	16.1	14.2	26.0	12.1	6.2	5.1	100.0

Thus, a simple calculation shows that 50.6 percent of the total persons moving leave the enterprise before fulfilling 1 year of activity, while 76.6 percent leave the enterprise before fulfilling 3 years of activity.

But the poor vocational training is merely one of the causes for fluctuation of the labor force, also being added to this certain organizational defects, such as the nonexistence of specialized personnel in certain cases (sociologists and psychologists) who would carry out the orientation and vocational selection of the workers depending on their aptitudes, the lack of specialized apparatuses needed to test the worker personnel, poor exactingness from some of the ones appointed to head the vocational training in the enterprises or to certify the quality of the qualification obtained. It is graphic that, due to the fluctuation of the labor force, the 32 enterprises involved lost more than 34 million lei in a single year.

As a result, one may state that, at least in some sectors of activity, worker personnel are not being selected, guided and trained so that each worker

* The situation refers to the 32 enterprises mentioned.

can cope with the production tasks under good conditions. Sometimes, even when the decision-making factors in the enterprises realize that the ones coming to be hired for certain jobs do not have either the training or aptitude for that vocation, they still decide to accept and qualify them by virtue of the principle that "no matter what, a job cannot remain unfilled."

But what happens in the case of hiring a worker for a job that does not correspond to his training and aptitudes? I will take into consideration a hypothetical situation, in the end examining the effects of the way to proceed in the selection and training of cadres.

So a job was filled and, thus, at least theoretically, it is possible for the plan distributed by the particular equipment to be fulfilled; a man received a job with which itis supposed beforehand he will cope ; a worker will be qualified and will enjoy all the rights due him in relation to the quantity, quality and social importance of the work done. As a result, an economic, legal and political act was undertaken consciously in full agreement with the legal and human laws fof our socialist society.

However, what are the consequences in case the labor force does not correspond qualitatively? A job was held by a man lacking the necessary qualification and aptitudes and who would have been much more suited to another job or another enterprise; as a result, the plan distributed by the equipment in the case will be fulfilled rarely and, in particular, with difficulty (from the viewpoint of physical as well as mental effort); distribution (pay)--since it is carried out according to the quantity, quality and social importance of the work done--is changed into a disadvantage, since the worker's earnings will be affected; the enterprise will have the average planned number of workers covered only in writing, but it becomes doubtful whether it will succeed in fulfilling all the plan indicators. In addition, besides the irrational use of the labor force, the enterprise will spend money to qualify them (and not always with the efficiency anticipated) and for raw material from which it does not have the guarantee that the result will be quality products and so forth. Really, in such a situation, can one speak of an economic, legal and human act useful to someone?

If we add to the above the consequences resulting on the personal, individual level, for most of the people employed in jobs for which they do not have the aptitude, the conclusion is clear. It is not accidental that the phrase "the appropriate man in the appropriate job" has become so accepted.

There is another aspect, too. The enterprises rarely have important and multilateral information available on the human factor, information, of course, chosen in an organized and systematic way. I have in mind a type of information other than that encountered in the personnel offices or the public organizations, that is, information of this kind: the sociovocational structure of the personnel, degree of integration into the labor collectives, the int rhuman relationships in the collectives, the formal and informal circulation of information, the sociovocational path (evolution of the worker personnel and so forth, information which cannot be collected without the aid

of specialized personnel, that is, sociologists and psychologists. Such information is indispensible to a thorough knowledge of the problems specific to the human element, while the lack of it brings out the failure of decision-making factors in the enterprises, centrals and ministries to understand the real importance of the problem of the qualification and most efficient possible use of the labor force, in the end their being the producer of material goods.

Whereas theoretically noone disputes the importance of the human factor, actually the attention of many enterprise leaders is directed predominantly toward technical production problems and only tangentially to the psychosocial problems in the labor collectives. In some cases it is simply incomprehensible how a unit leader who turns off a light he finds burning in vain, rightfully thinking of the money being thrown away, does not undertake anything even if millions of lei are wasted each year because the labor force is accepted, guided and trained inappropriately. While in the cases where there is some concern with such problems, often they try to solve them by resorting to personnel from other specialties (engineers, economists and so forth), if there are no psychologists or sociologists, who carry out improvised activities of ergonomy,psychotechnics, psychology, industrial sociology and so forth).

Fluctuation--Effect and Cause

Sometimes it is thought that the ones moving generally are the less serious people, a reason causing their "pilgrimage" from one enterprise to another. What is more, sometimes included in this category are nearly all categories of workers who leave the enterprises. There is nothing more mistaken than this view. And, yet, most times the true ones who fluctuate are not separated from the mass of workers who, for one reason or another, a well-founded reason, leave the enterprise. With a view to facilitating the deepening of the phenomenon, several theoretical definitions and definitions of terminology are required, even at the risk of a somewhat more didactical approach.

The first term which must be taken into consideration is "the movement of personnel" or "mobility of personnel," by which we mean any movement of personnel: entrance, exit, change in job within the same enterprise, regardless of whether it means a change in that person's sociovocational status. Thus, in this case, the implications at the macrosocial level do not enter the sphere of concerns.

The second term is "normal movement of personnel," which has in mind changes in the job--either motivated socially or representing the results of objective conditions. It is a matter of those persons who leave the enterprise for reasons such as the interruption of activity for child care, military service, retirement, transfer in the interest of the job, reduction in activity, deaths.

The third term, "actual fluctuation," means a change in the job within the

same enterprise (internal fluctuation[1]) or even a change in enterprise--a spontaneous, unforeseen change with negative consequences for the industrial unit and often for the individual. Included in this category are those persons leaving the enterprise as a result of cancellation of the work contract due to absences without leave or other disciplinary deviations, transfer upon request, carrying out criminal punishments and so forth.[2]

Yet, it should be stressed that the fluctuation of personnel is the result of a series of factors which depend either on the individual or the enterprise. The direct cause depending on the individual, generally, is his failure to achieve on the vocational, personal and social level, failure to fulfill the production quotas and, thus, reduced pay, conflicting states which may appear in some labor collectives and so forth. Many psychosociological analyses, unfortunately, stop here, feeling that these reasons are enough to explain the behavior of the fluctuating worker. But a more profound study of these aspects leads to the conclusion that, at least partially, there is a "cause of causes" and that is the insufficient degree of instruction and education.

It is true that there is a great variety of reasons calling those who leave an enterprise, but they are not always the real reasons for departure of the fluctuating workers. In many cases we must cope with a "masked" fluctuation also to a great extent caused by inappropriate vocational training. We feel that these aspects are of particular interest for the administrative and political leaders of the production units.

In the 32 enterprises where I did my investigations, the structure of normal departures were as follows:

Table 3

Reason	Interruption for child care	Military service	Retirement	Transferred in interest of job	Reduction of activity	Deaths	TOTAL
%	53.5	8.4	11.3	22.4	3.7	0.9	100.0

Theoretically, the reasons in Table 3 are justified socially, with the legislation in effect providing certain duties for the enterprises with regard to these categories of worker personnel. However, some graphic findings result from the practice of industrial sociologists.

---

1. We do not have available data on internal fluctuation, because, due to the nonexistence of specialists in social problems, nobody in the enterprises has records on this kind of personnel movement.

2. Details on reasons in specialized literature is done depending on the goals sought and thoroughness of the analyses. For example, the following reasons are provided in the work "Fluctuation of the Labor Force" (editor, Dr Honorina Cazacu), Scientific and Encyclopaedic Publishers, 1979, page 61: 1) Transfer on these persons' initiative; 2) Firing; 3) Cancellation of labor contract on the enterprise's initiative.

Sometimes some persons' reasons (for example, leaving the enterprise to care for children) corresponds to the facts. Sometimes such a justification is supported by the person's real wish to find another job, while the reason is based on the legal provisions which require the enterprise to rehire him in case he requests it. As a result, if he does not find a more convenient job, he may return to his initial activity at any time.

Another finding refers to the exaggerated percentage of transfers in the interest of the job (22.4 percent of the total normal departures of personnel). Actually, what is hidden under this means of leaving the enterprises? Does the large number of these transfers, in proportion to the needs for the labor force, justify such a percentage? The truth is that often the transfers in the interest of the job hide certain conflicting aspects between some of the workers and enterprise leaders, with the latter ridding themselves of the "undesirables" in this way. Thus they resort to a "little way out" which is convenient for both parties.*

Proceeding from the sociological research I have done, one may maintain that we again find the insufficient level of vocational training in the "subtext" of the various conflicting situations, to which we add some organizational problems. And it is clear that conflicting reasons which would cause so many personnel to leave cannot exist where the labor process is taking place under normal conditions.

Especially since the insufficient vocational training is an important reason for the actual fluctuation. In this case, the reasons for leaving are structured as follows:

Table 4:

Reason	Absence without leave	Request for transfer	Firings	Criminal penalties	Other disciplinary deviations	Other reasons	TOTAL
%	53.7	8.4	33.6	0.9	3.0	0.4	100.0

Without going into detail, we note the large number of cancellations of work contracts due to absences without leave (53.7 percent of total persons moving) as well as firings (33.6 percent of total). At the same time, given the high percentage of persons moving up to 30 years old (around 80 percent), one may deduce that among the causes for this situation are insufficient adaptation and failure to respect work discipline by a rather large portion of the employed youth as well as their failure to know the legal means for leaving the enterprise.

Particularly in youth from the rural areas who come to train in industry do we encounter such educational shortcomings, sometimes grafted on the feeling of vocational lack of achievement as a result of insufficient qualification.

---

* Sociologist Aurel Musat, following research done at the Tricodava Enterprise in Bucharest, also reached similar findings.

Youth and trade union organizations do not always make efforts to know and solve the problems specific to this catetory of worker appropriately in order to assure them continual education and vocational advanced training so that they gain new knowledge and habits for disciplined work in accordance with the requirements of activity in an industrial enterprise.

Yet, regardless of what means, why do such a large number of young workers leave the enterprises? Of course, some have well-founded reasons--changing their residence, marriage, leaving for studies, child care and so forth. However, others--by no means a negligible portion--leave the enterprise because they are dissatisfied with their vocational achievement, the earnings they receive and the work climate.

Proceeding from the real premise of the existence of almost unanimous wish of the youth to be employed in work and assert themselves vocationally and socially, the investigations I made, in agreement with other research of this type, show that the absence of such elements of satisfaction cause the desire of the youth to leave the enterprises. One of the most effective ways to approach and solve youth problems is precisely to improve the system for training and qualifying them within the enterprises. It is not an accidental finding that 80.1 percent of those moving have inappropriate vocational training. Sociologist Aurel Musat arrives at a similar conclusion in the research I mentioned earlier: "Their vocational training (of the youth--editor's note) being poor, they arrive at poor achievements in production with conflicts and dissatisfaction due to reduced pay and, in the end, they move." In the same regard, we observe in another work: "It is clear that the representative type of actual person moving in this situation is the young, unqualified worker."[1]

Thus, we have reconfirmed the conclusion that the main reason for the fluctuating behavior, particularly of youth, is poor quality in the vocational training taking place in the enterprises.

Quality of the Labor Force and Economic Efficiency

Examination of the listing of trades[2] in which workers are trained through courses for qualification in the enterprises leads to certain considerations connected with what was stated earlier. Naturally, under conditions of the progress recorded by all degrees of education in recent years, in accordance with the provisions of the listings, the minimum level of school training required for admittance to courses for qualification organized in the economic units is 8th grade. The relatively recent generalization of 10th-grade education will make it necessary to raise this minimum level in the future.

---

1. "Fluctuation of the Labor Force" (editor, Dr Honorina Cazacu), Scientific and Encyclopaedic Publishers, 1979, p 66.

2. Listing of trades attached to Ministry of Education and Instruction Order 6011/1978.

Just as for other industrial branches, the listing provides only those trades in which only those who have completed at least the 8th grade for light industry, also. But, as I was able to determine during the research carried out in the 32 enterprises of the Knitwear Industry Central, there are rather broad categories of worker perosnnel who request a job, although they possess a school training below the level of the minimum requirements imposed by the listing. What really happens with this category of applicant ?

Within the limit of available places, they are employed either as unqualified workers or in order to be qualified in less demanding trades. It is normal for it to be like this, even if the legal framework is exceeded in this way. However, how is this matter actually being carried out? Let us suppose that a person who graduated from the 6th grade, for example, requests a job in light industry. The acute need for the labor force almost in itself suggests a solution: The applicant is permitted to be qualified in the enterprise in the trade of a textile spinner precisely because this trade does not appear on the list. In this way the letter of the law is respected but, however, not also the spirit of the law.

A problem of principle arises here. In light industry, as in other branches as well, there is a great demand for labor force with a better and better qualification. For that reason, without lowering the requirements no matter how little, it is necessary to find the most appropriate means of selection, guidance and vocational training. Added to this is the need to use forms and means for flexible and differentiated qualification in agreement with the requirements of modern industry but also with the applicants' school training.

There is no single means for training for various trades. In some enterprises there is a school workshop, in others there is an aggregate school and there also is the rather widespread practice of assigning the new employees to a vocationally well-trained worker with seniority in the enterprise and one who, "it is supposed," possesses teaching skills.These forms for qualification which are so diverse natrually raise some questions: Which of these means really is the best? And if one proves to be the most effective, why is it not being generalized?

The various consequences of shortcomings in the training and rational use of the labor force are encountered on the common platform of large material losses. As I showed, the fluctuation of the labor force from the 32 enterprises which were the subject of analysis brought losses of more than 34 million lei in a single year. The losses due to failure to fulfill the production quotas by a portion of the worker personnel as a result of inappropriate qualification is not known, losses which, regardless of the amount, should closely concern those whose duty it is to assure maximum efficiency of economic activities.

It is unquestionable that the scientific substantiation of decisions regarding the recruitment, qualification and integration of the labor force involves an interdisciplinary approach to the entirety of psychosocial problems in the

enterprises on the basis of systematic research which provides the most faithful possible picture of socio-human relations correlated with the requirements for assuring minimum efficiency of production. Only such a total approach carried out with means of research specific to the area investigated permits a multilateral and thorough knowledge of the numerous aspects involved, this also being the only rational means for correcting some inappropriate states of affairs.

Extrapolating on a broader plane, I feel that with relatively small material efforts it would be possible to organize a network of laboratories of psychosociology, offices for school and vocational guidance not only in the enterprises but also in the educational units and in the labor force directorates and offices. In this way conditions could be created so that the selection, guidance and vocational reorientation as well as knowledge of human problems in all their complexity and profundity correspond fully to the technical and social progress characteristic of our society.

BRIEFS

BANI-SADR CONGRATULATES CEAUSESCU--To His Excellency Mr Nicolae Ceausescu, president of the Socialist Republic of Romania. On the occasion of Romania's liberation anniversary, I take pleasure in conveying to your excellency my warmest congratulations, as well as wishes for personal happiness and for continuous prosperity for the Romanian people. With greatest consideration, [signed] Abol Hasan Bani-Sadr, president of the Islamic Republic of Iran. [Text] [AU270944 Bucharest SCINTEIA in Romanian 25 Aug 80 p 5]

KARMAL GREETS CEAUSESCU--To Comrade Nicolae Ceausescu, RCP secretary general and president of the Socialist Republic of Romania. On the happy occasion of Romania's national day, I take great pleasure in extending our sincere and cordial congratulations to you, dear comrade, to the RCP, the government and the fraternal Romanian people on behalf of the Central Committee of the Democratic People's Party of Afghanistan, the Revolutionary Council and the people of the Democratic Republic of Afghanistan. I am convinced that fraternal relations, friendly ties and cooperation between our parties and peoples will continue to develop and strengthen in the interest of our countries and of peace in the world. Dear comrade, please accept my wishes for personal happiness and for new successes and prosperity to the friendly people of the Socialist Republic of Romania. [Signed] Babrak Karmal, secretary general of the Central Committee of the Democratic People's Party of Afghanistan and president of the Revolutionary Council and prime minister of the Democratic Republic of Afghanistan. ORIGINS OF CURRENT SOCIAL CONFLICTS ANALYZED

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1536, 8 Jun 80 pp 18-20

[Article by Milan Milosevic: "Are We Afraid of Conflict?"]

[Text] Does the word "conflict" frighten us?

Even the most prodigious systems and ideologies of a conflict-free society cannot long conceal the differing interests of groups, individuals, nationalities, strata and classes. A concealed conflict usually ends in an explosion.

A society which sees human happiness as its long-term goal must see all the economic, historical and social differences that exist and detect the degree to which desires differ from possibilities and construct mechanisms for the expression and conflict of interests.

Rural and urban areas, the haves and the have-nots, the productive and the unproductive, the educated and the uneducated, the employed and the unemployed, nationalities, regions, and strata, those who have power and those who do not, peasant sandals and shiny street shoes, these are all potential sources of conflict.

Our society takes pride in having begun to build mechanisms in which all these differing interests, desires and possibilities will be expressed. But it should not stop even here; it is not enough for all these conflicts to merely express themselves freely and collide. It is also necessary to study their nature and patterns and possible origins.

On the Dynamics of Political Bureaucracy

These are some of the points which were stressed at a forum organized last week by the Marxist Center of the Central Committee of the League of Communists of Serbia and the journal VIDICI [HORIZONS]. The topic was this: "Contradictions in Social Development and the Subjective Socialist Forces." One of the issues examined most frequently was the method of "managing the conflicts" which arise out of those contradictions.

As Dr Vucina Vasovic said in the debate, we lack both a developed theory of social conflicts and also a mechanism for managing conflicts. According to Vladimir Goati, one of the reasons is that we do not have a single good "panorama of the interests at play in Yugoslav society."

Zoran Vidojevic, who wrote the introductory address, attempted in some 80 or so typed pages to analyze the most acute contradictions of our social development.

Their source, he believes, is not the so-called "basic cell" of society, is not the organization of associated labor. The analysis should take as its point of departure the movement of surplus labor, the character of its use and distribution. The decisive centers of economic and political power are located outside these "cells."

"It is a question of domination by the political bureaucracy and technocracy in the system of expanded reproduction. This is the 'class formula' with which one can detect the essence of this process," Zoran Vidojevic writes.

Under present conditions the decisions on capital investment projects are not made by the producers, but by monopolistic power centers. Regional political exclusiveness results from the aspiration for complete economies in the republics and provinces; everyone would like to have everything.

Capacities of the same kind are duplicated, and relations of competition and exclusiveness (in production and distribution) are becoming stronger instead of establishment of associations and links.

The organization of labor has remained the same except for the increase in the number of supervisors, "industrial noncommissioned officers," in the production sector of the economy itself. The movement of specialists from production to nonproductive activities is becoming more intensive. Over the last 10 years the number of employees in the social services and government agencies has increased 55 percent, and in the financial sector it has increased even 82 percent!

The accelerated growth of the administration, Vidojevic says, corresponds to the ever greater governmentalization of production relations, the dependence of the productive sector of the economy on the sphere of government policy and on its own superstructure.

Under the real relations between the government and self-management, the state has up to now always been the stronger side. There is good reason to say, he says, that the contradiction between self-management and statism is being exacerbated more and more.

Neither centralistic nor decentralistic statism can resolve any of the most important issues of our society, neither the issue of relations among the

nationalities, nor achievement of equality and independence and authentic community spirit of the parts and the whole.

Conflicts Between the Workers and "Technostructures"

The political bureaucracy, Vidojevic says, is the strongest faction within the bureaucratic-technocratic groups because of its political power and governmental authority in the overall social framework. Below it on the ladder, according to his diagnosis, the conflicts between the workers who are the direct producers and the "technostructure," the managers and specialists in production organizations, are often very severe. However, the causes of these conflicts are very complex; they cannot be reduced to a set formula to the effect that self-management is being "usurped."

In the context of the erosion of the material foundation of self-management, uncertainty in the conduct of business, uncontrolled economic developments and the ever greater influence of the government and banking complex on the flows of reproduction, the "technostructure" is frequently unable to do what it is responsible for. Providing the resources for simple reproduction, paying high interest on credit, raising labor productivity, and technological progress--these things are all primarily in its "jurisdiction."

However, even when the technostructure consists of competent personnel and does not behave like a power over and above the direct producers, these conflicts occur. The workers, the direct producers, dissatisfied with their status, see the management team as principally to blame for the unfavorable or difficult situation even when the causes of that condition are largely, and not so rarely even primarily, of an external nature, Vidojevic says.

Stojan Tomic raised the question of how to explain, for example, the conflict or contradiction between man and things in certain socialist countries? How is socialism to be liberated so that in it things do not have greater importance or greater value than man? There is a certain logic here, Tomic says. A poor society does gravitate toward things, toward an abundance of things, which is not bad in itself. The rub comes when the pursuit of things becomes an end in itself.

Large Differences

Tomic drew attention to the conflicts that break out because of the uneven development from one place or community to another. When reduction of the differences is insisted on for 10, 20 and 30 years, but they increase, then this is certainly a contradictory situation. In this way utopias arise in the development of a society which wants to diminish differences: an illusion is created that it is possible to overcome them in 5, 10 or 15 years, but at certain points the differences are greater than before the war. The level of employment, for example, is 19-fold higher in opstinas at the top than in those at the bottom (2.64 percent in one and 51 percent in the other), and the illiteracy rate is sixfold higher in those at the bottom.

"It seems to me," says Vucina Vasovic, "that a highly contradictory situation prevails when we look at our aspirations, our goals and our real capabilities.

"For example, we set up a system of a very free articulation of interests and demands, this kind of system develops people's expectations, very high aspirations, expectations that the real situation can be rapidly altered through political activism, but the real possibilities do not allow this. The question is the extent to which this can be an additional cause of new contradictions and of an intensification of certain conflicts."

One of the important conclusions, it seems, is that self-management would remain imprisoned within the confines of bourgeois society if it were reduced solely to free expression and confrontation of all existing interests. The awareness of the essential goals of the community is also important.

At this point in the debate space was specifically devoted to the role of the vanguard or, as it is put, the "subjective forces"--the League of Communists, the trade unions, and the SAWP.

Group and Individual Egoism

These are the different paces gone through in the debate which concerned itself with many issues--from moral dilemmas (Manojlo Brocic: "I insist on the term 'morality' because this is precisely the self-liberation and the essentially human attribute by which one can recognize a socialism and communism that has a human face")....

... to dilemmas as to whether our self-management and life have not been excessively regulated.

In conclusion let something be said about the conflict of individual group and general interests. This conflict, it was said, finds its way even into the practical activity of political organizations. It is not an isolated phenomenon, Vidojevic said in his study, for certain political leadership forums to defend exclusively their own interests and the privileges they have acquired.

Group and private egoism penetrate even into the working class itself, into those parts of it which are in a more favorable position.

The problem of realizing the joint and truly general interests of the class and society as a whole is moving into the foreground of the topical issues of society and the realization of overall self-management. The forces tending toward exclusiveness and partialization are very strong. However, they are not anonymous.

These contradictions may become exacerbated and may result in a crisis of social development, he says. A crisis is not anything negative in and of itself. The essential thing is whether it creates the possibilities for a new step in development of the revolution.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

LAXNESS IN PROTECTING CULTURAL MONUMENTS CRITICIZED

Tirana BASHKIMI in Albanian 29 Aug 80 p 2

[Article by Alfred Kazanxhi: "No Damage Should Be Allowed To Be Done to Cultural Monuments"]

[Excerpts] The state shows special interest in all monuments, taking a direct role in their protection. This protection was sanctioned by a decree issued in 1971. In addition to the people's councils which have the obligation to protect these treasures of our culture, the Ministry of Education has charged the school directorates with taking care of cultural monuments in their areas and being concerned with their upkeep, thereby correctly evaluating the problem of the protection of cultural monuments as a matter for the broad masses.

However, there are cases of indifference in regard to this treasure which we have inherited over the ages. There are many examples. The Naziresha mosque, a cultural monument of great value, has been restored in Elbasan. But if you were to see this monument today, you would see that it has been poorly kept up. The wall around the monument is broken, the windows are damaged. The state is spending money to preserve these treasures but indifferent individuals and evil-doers are taking materials from these restorations. But how does this happen when the executive committee of the people's councils of the district and of the quarter, in particular, are supposed to be taking care of this monument? The mozaic in front of the palace of sports in Durres City, for which considerable funds were spent in 1978, has been damaged again.

We know that all the damage is not done in 1 day. Any building, even a cultural monument, is damaged when no one shows any interest in its upkeep for a relatively long time. First, children play on it and then they throw things at it and the damage on a mass scale begins. Some chairmen of people's councils have an indifferent attitude. The chairman of the people's council in the Kala quarter of Elbasan allowed violations to occur in the area protected by the state and in the museum zone and the secretary of the people's council in the village of Cuke in Sarande District allowed a cultural monument to be destroyed. Often the people's councils do not report damage to monuments or when they do report it (often very late) it is hard to find the perpetrators.

There are people's councils which, when damage to monuments is discovered and they are called to account, justify themselves by saying: "We did not know that it was a cultural monument", even though every cultural monument is registered by the Institute for Cultural Monuments. There are laws dealing with the protection of cultural monuments and stipulating punishments for those who damage them.

BIOGRAPHICAL DATA ON NEW MEMBERS OF ACADEMY OF SCIENCES

Sofia KHIMIYA I INDUSTRIYA in Bulgarian No 6, 1980 pp 279-280

[Biographical data: "New Members of the Bulgarian Academy of Sciences"]

[Text] At the session of the General Assembly of Academicians held on 28 and 29 November 1979 at the BAN [Bulgarian Academy of Sciences], elections were held for new members of the Academy according to the announced scientific areas. The following new academicians and corresponding members were elected in the area of chemistry: Academician Lyubomir Dimitrov Zhelyazkov, for medical chemistry; Academician Georgi Manuilov Bliznakov in general and inorganic chemistry, and Corresponding Member Yordan Petrov Malinovski, in the physical chemistry of photographic processes. Extensive material on the occasion of the 60th birthday of Academician L. Zhelyazkov was published in the journal KHIMIYA I INDUSTRIYA, No 1, 1979.

[Academician Georgi M. Bliznakov; by Senior Science Associate Dimitur Klisurski]

Academician Georgi M. Bliznakov is widely known among Bulgarian chemists and the Bulgarian scientific community for his diverse scientific research, teaching, scientific-organizational and social activities.

In world science, the name of Academician Bliznakov is linked with his original scientific research in three extremely important scientific areas: crystal growth, adsorption and catalysis, and inorganic synthesis. This research has been a very substantial contribution to explaining the influence of adsorption of impurities on the equilibrium form of crystals and on the formation of the crystal nuclei, to explaining the quantitative patterns of the effect of adsorption of foreign matter on the linear rate of crystallization, and to the development of the theory of epitaxial growth. Academician Bliznakov was the first to find the correct theoretical approach to a thermodynamic and thermodynamic statistical interpretation of the

effect of adsorption on crystallization processes. The equation derived by him expressing the correlation between the linear rate of crystallization and the concentration of the adsorbing substance has gained exhaustive experimental affirmation.

Extensive international recognition has also been given to his research on natural and synthetic adsorbents, their modification and the relationship between adsorption and a number of other basic physicochemical properties (dispersity, pore radius, biographic and induced heterogeneity, and conductivity). Very substantial have been the contributions of Academician Bliznakov and his coworkers in studying the catalytically active surface of metals, semiconductors and insulators, in explaining the kinetics and mechanism of industrially important catalytic reactions, in establishing the correlations between catalytic properties, dispersity, magnetic properties, conductivity, the correlation between the energy and nature of the bond of oxygen on the surface layer of oxide catalysts and their activity and selectivity in oxidation processes, and so forth.

We must also specially mention the extensive research on the synthesis of important materials for modern technology, and particularly the high-hardness borides, the low separating work of an electron, and other interesting properties.

The results of the designated fundamental research by Academician Bliznakov have been generalized in more than 200 original scientific works published in well-known Bulgarian and international publications. An expression of the international recognition has been the election of Academician Bliznakov as chairman of the International Committee for Boron and Borides, as a member of the International Council on Catalysis, and as an honorary member of scientific organizations abroad, as a member of the editorial staffs of well-known international and Bulgarian journals, the invitations to give lectures at Humboldt University in Berlin, Moscow State University and the Moscow Institute for Metals and Alloys, and so forth.

Upon the initiative and with the personal assistance of Academician Bliznakov, a number of original research methods have been worked out, original equipment designed, and a broad range of new modern experimental methods introduced in our research practices such as "Auger," which is spectroscopy which by electronic and ion methods stimulates desorption, and so forth.

Characteristic of the scientific creativity of Academician Bliznakov has been his constant and vital interest not only in the urgent problems of modern science, but also modern technical progress. Being one of the recognized representatives of the established and well-known school on the theory and experimental methods of crystal growth, he for the first time became the initiator of developing the methods and equipment for growing industrial monocrystals which are of primary importance for various areas of modern technology and industry.

Also linked to the name of Academician Bliznakov is the extensive application of improved methods for applying wear-resistant boride surfaces on hard-alloy cutting tools, and so forth. We must make special mention also of the methods developed under the leadership or with the personal involvement of Academician Bliznakov and in collaboration with Soviet scientific collectives for obtaining new highly active and highly selective catalysts for the industrial process of reducing methanol to formaldehyde; there is also the method developed in Bulgaria for preparing a catalyst for the complete reduction of hydrocarbons and carbon monoxide, an adsorbent for treating industrial water, and a number of other original applied developments.

Also indisputable is the contribution of Academician Bliznakov to the training of highly skilled personnel. Over the decades he has given basic and special lecture courses on general and inorganic chemistry, physical chemistry, kenetics and catalysis, and so forth. Under his leadership, a significant number of dissertation works has been defended, and research personnel has been trained and they are successfully at work on the modern problems of general and inorganic chemistry.

As the leader of many years of the Chair of Inorganic Chemistry at Sofia University, and the director of the Institute for General and Inorganic Chemistry from its inception, Academician Bliznakov has contributed greatly to the organization of these institutes and to raising the level of their academic, research and integrated activities. In addition, for several years Academician Bliznakov has been the chief scientific secretary of the BAN. We must also note his active social activities as the chairman of the Union for Chemistry and the Chemical Industry under the Central Council of the Bulgarian Scientific and Technical Unions.

The achievements of Academician Bliznakov in the development of our chemical science have been highly regarded by our government and society. Expression of this regard has been the awarding of high decorations, the presentation of the Dimitrov Prize for Science and the honorary title "Honored Scientist," as well as his unanimous election by the BAN General Assembly as academician for general and inorganic chemistry.

May we wish Academician Bliznakov good health and new creative accomplishments.

[Prof Dr Yordan Malinovski, corresponding member of the BAN, by Science Associate Kiril Petkov]

Malinovski was born in 1923 in Sliven. From 1949, he was a regular assistant at the Physics Faculty of Sofia University, from 1959, a senior science associate at the Institute for Physical Chemistry under the BAN, and from 1964, professor at the same institute. During this period for several years he was an instructor at the VIKhVP [Higher Food Industry Institute] in Plovdiv and on the Physical Chemistry Chair at the Physics and Mathematical Faculty of the Kl. Okhridski University of Sofia. He was a candidate of chemical sciences from 1958, and defended his doctoral dissertation in 1969. Since 1967, he has been the director of the Central Laboratory for Photographic Processes [TsLAFOP] under the BAN, and in 1979 was elected a corresponding member of the BAN.

While an assistant and a scientific coworker at the Physics Institute of the BAN, Prof Malinovski succeeded in obtaining significant results relating to the physical maturing of photographic emulsions and in showing that the sensitivity of photographic materials depends substantially upon the distribution of the latent image between the surface and the volume of the emulsion grains. This is known as the "method of differential developing" and up to now has been used by a number of firms which produce photographic materials (ORWO, AGFA) in order to give them physical characteristics. The emulsion developed at that time for X-ray paper has been produced in Bulgaria.

In the scientific activities of Prof Malinovksi, a particular place is held by model research on the mechanism of the elementary photographic process on the monocrystals of silver bromide. For this purpose he developed a method and equipment for direct synthesis and for drawing out these monocrystals. This method at present is widely used throughout the world for obtaining various high-purity, light-sensitive compounds. Devices were also developed for producing and applying impurities and for studying the influence of the additives on the creation of the latent image. In this method important questions related to the mechanism of action of the active components of photomaterials were elucidated.

A major accomplishment of Prof Y. Malinovski has been the experimental elucidation of the removal of photographic empty spaces in the silver halide crystals, as well as a theoretical elucidation of their role in the creation of the latent image. The research made it possible to supplement the theory of Gurney and Mott on the formation of the latent image. The original feature in the elaborated method was the combining of purely physical principles (the drawing of the photoholes to the surface through light and electric impulses) with methods known from photographic practices (the use of metal grains as powerful catalysts for the developing process). Using the described method, an integrated picture of the photographic process was created and this included also the participation of the photogenerated holes and presently known in the literature as a symmetrical scheme.

The contributions of Prof Y. Malinovski have been highly regarded and have been widely reflected in scientific literature (105 scientific publications and 16 patents).

Considering the long-range importance of this research for photographic practices, in 1967 the TsLAFOP was organized with Prof Dr Yordan Malinovski as its director. At present this laboratory is recognized as one of the world centers for photographic science.

In recent years the TsLAFOP has developed an original procedure for obtaining thin layers in a vacuum, and this opens up the path to developing photographic materials using a fundamentally new method, namely the evaporation of the light-sensitive substances. This research also throws light on the unknown mechanism of chemical sensitization and the process of development,

in proving that it begins with the rise and growth of a new phase from elementary silver which catalyzes the reduction process.

The new method also makes it possible to use silver-free compounds. It has a number of technical, functional and ecological advantages and leads to the surmounting of certain basic difficulties in handling the extreme separating power and is free of powder defects. One of the new photomaterials in terms of separating power exceeds all those previously known in the world with 1,000-fold greater sensitivity.

At present the TsLAFOP is organizing semi-industrial production of photographic plates with a high-separating power and is developing several variations of the plates for obtaining photopatterns in microelectronics.

On these problems it is collaborating with the institutes of the USSR Academy of Sciences, the GDR Academy of Sciences, with the Karl Zeiss Plant in the GDR, and the AGFA-Gevaert in the FRG.

In 1970, Prof Dr Y. Malinovski was awarded the Dimitrov Prize for Science for achievements in the area of the theory of the photographic process. In 1974, he received an award of the U.S. Society for Photographic Science and Equipment for the best work published in the society's journal, and in 1975 was elected a member of the society. In the following year, he was elected an honorary member of the Royal Photographic Society in Great Britain. In 1978, for his work on the mechanism of the developing of the photographic image of his graduate student Iv. Konstantinov, he was awarded the Egert Prize of the Swiss Federal Polytechnical School in Zurich.

Over the brief period since the creation of the TsLAFOP up to the present, seven scientific coworkers have defended their candidate dissertations under his leadership. There already is a Bulgarian school of specialists in the area of photographic science and equipment, and its representatives are invited as guests to give major papers at virtually all international undertakings in this area (Moscow, Dresden, Prague, Zurich, Munich, Paris, Rochester and Tokyo).

The election of Prof Dr Y. Malinovski as corresponding member is a recognition of his contributions to the development of photographic science.

VANDALISM OF VENDING MACHINES, PHONE BOOTHS NOTED

Sofia STURSHEL in Bulgarian 8 Aug 80 p 3

[Article by Lyubomir Dashev and Radoslav Velikov: "How Long Are We Going To Be at the End of the Line"]

[Text] When any of our Bulgarian brethren would come back from wherever he had been, even from one of the neighboring Balkan countries, he would immediately start:

"Oh brother, where they are, and where we are! What a difference, how much more advanced they are! Unbelievable! You put the coin in the slot, press the button and out comes a full cup of coffee or cola. You push the button of another vending machine and out comes a newspaper. And there are others for cigarettes and even for stockings."

Such were also the words of a friend of ours who had invited us after his return from a prolonged business trip to one of the "top European" countries, as he himself put it. Raising his glass of whiskey, he said: "How long are we Bulgarians going to be at the end of the line? How long?"

We would like to remind people like that that in Bulgaria, even though it is a small country, we also have similar machines for measuring weight. We also have vending machines for coffee and juices in the center of Sofia next to the Students Club and in other places as well. Some newspaper vending machines also appeared. And even telephone books appeared in the telephone booths. But the way they appeared they shortly became unfit for their purpose, while the telephone books disappeared even in a shorter time than that.

We have witnessed tragic scenes in the evenings and at later hours in front of the vending machines next to the Students Club. Many people used their fists on the machines. Others used them for target practice. And still others put in them anything but coins and then wondered why the coffee was not coming out.

Other victims of abuse today still are the automatic telephones. Quite often the diaphragms of the receivers and the wires are missing. It would be no exaggeration to say that quite often we find telephone booths completely stripped. And we still find artists who love to leave their marks on the walls. The seats in the buses, the public toilets and many, many other places abound with graffiti as well.

And we should not be surprised that so many of the cafes and pastry shops need frequent renovations. The reupholstery of the chairs is usually ruined in no time!

Reading these lines somebody would probably smile skeptically and say that we have written many times about similar things and that writing would not help. We should probably impose fatter fines for the violators, and reimbursement for damages and it would not be a bad idea to print their names in the press.

In other words, nobody likes to be at the end of the line. And our Bulgarian brethren should keep their eyes more widely open next time they go abroad.

CIVIL DEFENSE EXERCISE HELD AT AGRICULTURAL COOPERATIVE

Prague ZEMEDELSKE NOVINY in Czech 1 Aug 80 supplement NAS DOMOV pp 2,3

[Article by Josef Semerak "Strike Above Manin"]

> [Text] The meeting in the cultural center of the Mestecko Unified Agricultural Cooperative was for a while transformed into an operations room for the civil defense staff of the agricultural facility. The cadastral map was still clean, as clean as the countryside below Makyta, Portas, below Manin and above the dam. Local eyewitnesses talk in terse sentences of people's heroism in World War II. It swept through this virgin land like a tornado, leaving horror and pain in its wake...

Engineer Zezula chairman of the Peace Unified Agricultural Cooperative in Mestecko, is bending over the carefully assembled documentation spread over the work table. He is as serious as he is in consultations regarding the tasks of the cooperative which has its facilities spread over six neighboring communities in very complex natural and economic conditions. Its narrowly specialized production concentrating on bulk fodder, meat, milk and wool keeps him busy full time. After all, the cooperative has currently 120 million in assets. The cooperative's 835 workers, whose average age is 38 years, stand witness to the fact that it is a highly prosperous cooperative from which young people do not flee to the city. There are actually quite a few young people on the farms and they like their work. Even the management is young. As the chairman, Engineer Zezula, stated: "We have a cooperative with advanced cadre and a good operational base..."

Faces of the members of the training staff betray suspense, concentration and a bit of stage fright. All of them, comrades Janovec, Kozacik, Jurzik, Engineer Tucka and others prepared themselves thoroughly for this exercise. They would meet after work, mutually coordinate their respective roles, practice their functions in order to present a demonstration for the participants and prove to themselves that they had mastered the complex problems of defending their facilities and stood ready to defend what they had built with their own hands.

The topic presented by the commentator gives an indication of what this exercise can grow into: Activities of the civil defense staff of an agricultural facility during a nuclear attack...

"Air-raid alert!" reports the telephone operator to the staff. The commandant, Engineer Zezula, orders checking the dissemination of the signal to all facility components, specifies the staff members' activities, issues instructions. The faintly recalled sound of sirens reverberates through the communities as it used to a long time ago... Groups of inhabitants head for the shelters. Feverish work on reinforcement of agricultural installations, stables and parturition stalls goes on. Windows and gates are lined with compressed straw, tar paper, boards... Fodder is stored and covered... protective measures for water... protection of finished products ready for storage... We observe the members of the cooperative at the farm in Luky pod Makytou. They work with devotion, conscious of their tasks, duty, hours and minutes that remian till the order is carried out.

The anticipated radiation and chemical hazard is now expressed in a radiation alert. A nuclear "hit" somewhere in Moravia and its radioactive cloud is now "spreading through the Vah River valley over the Javorniky Mountains." The staff adopts new measures.

During radioactive contamination, orders are issued by Engineer Karol Krsko, the head of the farm in Luky. Clean areas with modern technical equipment for housing animals, silos, agricultural buildings are partially sealed. Access and evacuation routes made of prefabricated concrete disappear in their steep ascent. An improvised filtrating ventilation system supplies fresh air for animals.

By then there arrives a patrol car with its crew wearing protective clothing against chemicals; they measure the radiation level, stake out contaminated areas... A fire broke out at the lower part of the farm... It is liquidated in several minutes by a crew of firemen who first evacuated women who suffered burns. The women are treated by the first aid crew... The air is filled with all sorts of activity occurring in succession at an incredible rate.

The sound of engines is heard from the lower gate. A unit for decontamination of the terrain arrives. A spraying car, an improvised road sweeper attached to a tractor. Radioactive slime flows from roadways into ditches. Passages are cleared. Spraying frames deactivate contaminated equiment...

But the most difficult phase of the exercise is only beginning: veterinary decontamination of animals. Sampling of fodder from troughs, water samples, samples of milk, blood, straw from stalls...

In the mobile PVL 4 veterinary laboratory, tasks were already assigned by Gabriela Vontorcikova, doctor of veterinary medicine. Just to make sure, Engineer Stanislav Marosz will analyze samples of toxic agents while

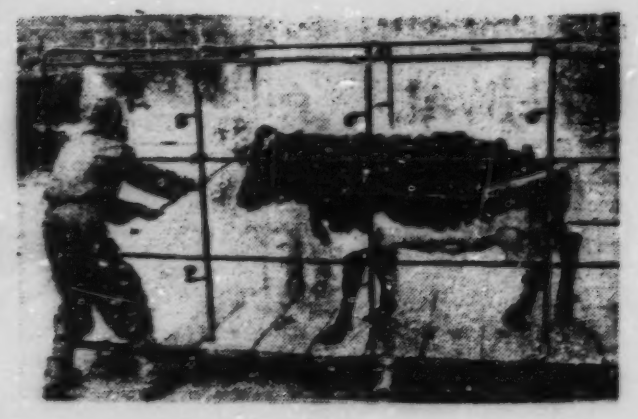
Doctor Vontorcikova will simultaneously determine the radioactivity of samples by means of a computer.

One milch cow after another is chased into a special cage equipped with jets to sprinkle contaminated animals with warm water to undertake decontamination. After a veterinary checkup the animals are led to an uncontaminated area.

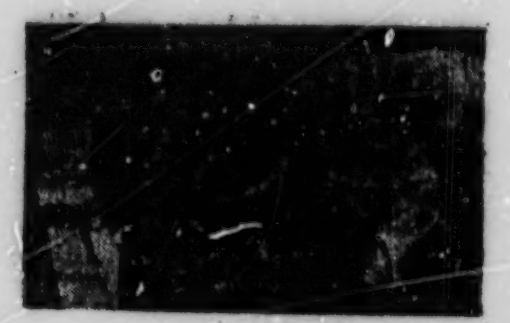
The statewide demonstration exercise at the Unified Agricultural Cooperative's civil defense in Mestecko lasted 2 whole days. For 2 days the inhabitants of the villages below steep slopes lived under extraordinary conditions. And if this particular exercise showed how to cope with keeping up agricultural production during nuclear attack, those 2 days were more than needed.

In the afternoon, members of the cooperatives set out for the fields.

A crew of firemen extinguishes a fire while wounded are treated by girls wearing dark clothing and protective masks.



Animal protection crew during decontamination of cows.



Veterinary Doctor Gabriela Vontorcikova checking with her colleagues in the mobile veterinary laboratory samples taken at agricultural facilities.

Overall view of the farm of the United Agricultural Cooperative in Luky under Makyta. Participants in the statewide demonstration exercise in front of a reinforced installation.

BRIEFS

'ANTI-ALCOHOL BILL' BEING PREPARED--Prague, 13 August--While in 1962 a total of 16 percent of all punishable offenses in the Czech Socialist Republic were committed while under the influence of alcohol, in recent years the role of alcohol in punishable activities has reached already 35 percent. The negative influence of alcoholism is particularly markedly manifested in road traffic--in the past 2 years intoxicated drivers have caused a death in roughly every 37th accident. Alcoholism is also one of the causes of absenteeism and frequent changing of jobs. It undermines work discipline, leads to labor accidents, divorces and so forth. The existing legal regulations have become outdated. They do not create sufficient scope for the protection of society against the consequences of improper consumption of alcohol and do not prosecute some of the new, nonalcoholic forms of toxocomania. For this reason a new draft bill is being prepared, which envisages--above all--central control of the protection against alcoholism and other toxicomanias, and sets concrete tasks for bodies and organizations. An important role will be played by the national committees, which will be authorized to establish special commissions to be their initiatory and control organs, headed by a national committee deputy. [CTK report: "For a More Efficient Combating of Alcoholism"] [Text] [AU181543 Prague RUDE PRAVO in Czech 14 Aug 80 p 2]

REGULATIONS ON LEAVE, PASSES EXPLAINED

East Berlin AR ARMEERUNDSCHAU in German No 8, Aug 80 signed to press 2 Jun 80 pp 84-86

['Information' feature: "Leave and Off-Duty Time"]

[Text] We repeatedly receive letters from readers asking about provisions of the leave regulation (DV 010/0/007) which applies to the National People's Army, the Border Troops of the GDR and those members serving in the Civil Defense of the GDR. Below we offer a summary of the most important provisions about leave and off-duty time.

General Principles:

The following types of leave exist: ordinary leave, extended pass, pass, special leave as a reward and on special occasions and convalescent leave. The last of these is, as is time spent at spas, regulated by military provisions on health care. There exists a legal right to ordinary leave. No legal claim may be made to the other types of leave. They are — as noted in Number 4(2) — to be granted "with consideration of standing combat readiness." Leave planning on the whole must be based on the premise that standing combat readiness, guarding of the state frontier and assigned teaching and training goals are reached. As a rule no leave is granted prior to completion of basic military training.

Ordinary Leave

The amount of ordinary leave depends on service status. During his 18 months of obligatory service, the conscript soldier receives 18 days of ordinary leave, Sundays and legal holidays not counted. Warrant officer and officer cadets and students of higher military schools are entitled to 30 calendar days of leave including four Sundays and legal holidays per calendar year. For the year in which they are commissioned, cadets receive the same leave as limited service or career officers. Here provision must be made for their receiving at least two-thirds of their ordinary leave entitlement prior to reporting for troop service.

A soldier, noncommissioned officer [NCO], limited service officer, career NCO, warrant officer or career officer who voluntarily extends his term of service receives correspondingly more ordinary leave (see Table). In the call-up year this is computed proportionally beginning from the month during which active service begins. In the mustering-out year the same is done up to and including the month during which active military service ends. When length of service giving entitlement to increased leave is reached, it is granted fully from the calendar year during which conditions are satisfied.

Extended Pass

This is leave over the weekend together with one day of ordinary leave and normally begins on Friday after duty hours and ends on Tuesday before duty hours begin. It can also be granted over legal holidays. Soldiers in conscript service, NCO, warrant officer and officer candidates and cadets at higher military schools can receive VKU [extended pass]. All other comrades receive it only if they do not live in the garrison area and are thus not able to visit their place of residence daily. Officer candidates receive VKU once a quarter from Friday after duty hours to Wednesday before duty hours begin with three days of ordinary leave being charged. An exception is the quarter during which they take their ordinary leave. In addition they receive extended pass charged as one day of ordinary leave either for Easter (from Thursday after duty hours to Tuesday before duty hours begin) or for Pentecost (from Friday after duty hours to Wednesday before duty hours begin) or Christmas (from 23 December after duty hours to 28 December before duty hours begin) or for New Year's (from 30 December after duty hours until 4 January before duty hours begin).

Pass

This is also leave over the weekend or over legal holidays. It begins on Saturday after duty hours and ends on Monday before duty hours begin. If it is a pass over legal holidays, then it begins after duty hours on the day before the holiday and ends before duty hours begin on the day after the holiday or holidays. Pass can be combined with special leave granted as a reward.

Special Leave

This is nonscheduled leave either as a reward for outstanding achievements or for special occasions. Anyone granted special leave as a reward should receive the opportunity to take it immediately or within 30 calendar days. Sundays, legal holidays and days during which off-duty time is granted are not counted in this case.

What are special occasions which justify special leave?

They could be one's own wedding, the birth of a child, moving, [socialist] confirmation or marriage of one's own children as well as catastrophes hitting one's own household, severe illness or death of a spouse, children, parents or parents-in-law, brothers or sisters [or] daughters- and sons-in-law. There is special leave of two to five days in these cases. The same applies to preparing for or concluding a job contract or joining a socialist society in connection with impending discharge as well as preparing to begin higher or trade school education. If one of the circumstances noted here should arise during normal leave, the person in question can turn to the local senior officer. He is authorized to grant special leave in such cases. The leave certificate is accordingly extended by him and, at the same time, he undertakes to notify the person's unit. In addition, up to a total of five days of special leave per calendar year can be granted if:
(a) the spouse or a child belonging to the household is sick and care cannot be provided by other family members or other persons;
(b) the spouse is hospitalized and care or housing of the children cannot be done by other family members or other persons.

The actual circumstances must be verified by an official or medical certificate when applying for special leave or upon inquiry.

It goes without saying that special leave is only granted concurrently with the special circumstances. The nature of the case, the functions to be accomplished and the travel time are to be considered in establishing its length. Special leave of the type described here cannot be retroactively applied for.

Leave Planning

For soldiers doing their basic military service, leave is planned on the basis of the 18 months period but for all other comrades it is planned for one calendar year. An effort is made to see that soldiers doing basic military service can go on leave at least twice during a half-year, one leave for five consecutive days ordinary leave and one leave on extended pass. This can be for entire units from squad to company or also for individual members or border soldiers. Soldiers and limited service NCO's who are not able to visit their home daily should be given at least four leave trips within six months. If in such cases they receive more than three extended passes, all days except Sundays and legal holidays are charged as ordinary leave. At least six leave trips in a half-year under the same conditions are provided for limited service officers, career NCO's, warrant officers and career officers. If they receive more than five extended passes during this period, all days except Sundays and legal holidays are to be charged to ordinary leave.

Leave Request

Each leave is to be requested in the leave book up to five days before it is to begin. The applicant is to be notified as to approval or disapproval no later than three days before the leave is to begin.

Travel Time

In addition to soldiers in basic military service, warrant officer and officer candidates and cadets in higher military schools, all other comrades going on extended pass or pass can receive additional travel time if travel from the garrison to the place of residence and back is more than 12 hours. Either the beginning of the leave is advanced or [the time] is added to the leave and is established using timetables. Soldiers and limited service NCO's receive travel time six times in a calendar year while limited service officers, career NCO's, warrant officers and career officers receive it ten times.

Illness During Leave

Anyone becoming ill while on leave or who becomes unable to travel while proceeding on leave is to the doctor of the nearest NVA [National People's Army] or Border Troops facility. If he is unable to do this, he must contact the nearest facility and request a house call by a doctor. Only when neither of these is possible, can he resort to another doctor. In every case the illness is to be immediately reported to the local senior officer. He then informs the patient's formation or unit. Leave days lost are not charged to ordinary leave if the illness is certified by a doctor.

Leave for Reservists

There is no entitlement to ordinary leave during reserve military service. If such service lasts longer than three months, extended pass may be given once every two months. Pass is granted in accordance with the provisions already discussed. For a period of service up to three months reservists can, if the appropriate conditions exist, receive travel time twice and, in addition, once within two months.

Free Leave Trips

A certain number of free leave trips are available to all members of the armed forces for travel with the Deutsche Reichsbahn [GDR railroad] or by bus from the garrison or place of residence to a vacation spot in the GDR. Those not living in the garrison area receive four trips per calender year (soldiers doing basic military service receive a total of six during their 18 months of service). Those living in the garrison area receive one per year. Reservists on active duty for more than three months receive, if they do not reside in the garrison area, one free leave

every three months from the garrison to a vacation spot in the GDR. If the vacation is, with permission of supervisors, spent in other socialist countries, free travel to the corresponding GDR border railroad station can be provided. Second class military rail tickets are issued for free leave travel.

Fare Reduction

Use may be made of the conditions for purchasing commuter return tickets for leave travel with the Deutsche Reichsbahn. For this purpose the route is entered on the leave certificate. The leave certificate is good for a 75 percent reduction in purchasing second class tickets.

Duty-Free Time

This is a release from duty which is limited in time and established by supervisors. As a rule it is connected with permission to leave the garrison for a limited period of time. Duty-free time can be also granted in connection with extended pass or with a pass. Rules about duty-free days in border companies are not effected by this.

Anyone on duty for seven or more hours in order to accomplish leadership tasks, tasks and measures to maintain combat readiness and for the protection of military facilities, to accomplish training missions or to prepare for or accomplish planned political work tasks on Sundays or legal holidays can receive appropriate off-duty time. As a rule this is to be granted on another day of the following calendar week. For soldiers doing basic military service and limited service soldiers and NCO's, the rule applies only when they are assigned to units primarily having guard functions. Special rules apply to servicemen assigned to the duty system. These are established by the appropriate deputy ministers for national defense. NCO, warrant officer and officer candidates and cadets at higher military schools receive no duty-free time for duties performed on Sundays and legal holidays.

Duty-free time can also be granted to career NCO's, warrant officers and career officers to participate in training and examinations in correspondence or evening studies. The same applies to servicemen and border soldiers to accomplish state or social functions, particularly as deputies of elected people's representative bodies; however, in such cases accomplishment of duty tasks and combat readiness cannot be effected. Duty-free time is also given if a person is summoned to a court or a state investigative or control organ. It can also be requested if a five-day special leave to take care of sick family members is not sufficient and medical certificates are presented. But in such cases assistance from supervisors, local state organs, the local senior officer and also local social organs should be sought in order to find solutions that require either no or only very brief off-duty time.

For the realization of sociopolitical measures DV 010/0/007 also provides duty-free time for female members of our armed forces and for the spouses of career NCO's, warrant officers and career officers in so far as the last named have a higher requirement for ordinary leave. Space is not here sufficient to present a detailed exposition of these rules.

Explanation of Terms

Some important explanations of terms are given in an appendix to DV 010/0/007. Here some examples. The term "after duty hours" is defined as "following completion of duty, following completion of headquarters service" as well as "from 1000 hours on as a rule on Sundays and holidays." The term "before duty hours begin" is understood to mean "up to 30 minutes before morning roll call or beginning of headquarters service" as well as "up to 15 minutes before reveille for soldiers doing basic military service, NCO, warrant officer and officer candidates." The place of residence is considered to be the locality in which the serviceman or member of the Border Troops of the GDR is registered with the police. Proportional ordinary leave is computed by months. Fractions are rounded off to a full day. If, for example, the authorized ordinary leave for the calendar year is 26 days, then it would equal 2.16 days for one month. This amounts to 6.48 days for three months and this would be rounded off to 7 full days.

Table 1. Ordinary Leave Entitlement

Status	Number of Calendar Days per Calendar Year by Time in Service							
	1	2	3	4	5	6-10	11-15	16+
	Years in Service							
Soldiers and limited service NCO's	24	25	26	30	31	32		
Career NCO's	24	26	29	32	35	38	42	46
Limited service officers, warrant officers and career officers	36	36	36	36	36	38	42	46

For an entitlement of 24 to 29 days, 3 Sundays or legal holidays are counted as ordinary leave. For an entitlement of 30 or more days, the corresponding figure is 4.

JULY-AUGUST 1980 DOUBLE ISSUE OF SED THEORETICAL JOURNAL REVIEWED

East Berlin NEUES DEUTSCHLAND in German 11 Jul 80 p 4

[Helmut Caspar review of East Berlin EINHEIT in German Vol 35, No 7/8, July-August 1980, signed to press 13 June 1980, pp 673-864: "A Policy to Safeguard Peace." Translations and/or summaries of the articles by the authors referred to below as well as by others are published in pages following this review]

[Text] "Socialism--The Real Humanism of Our Era" is the theme of the latest EINHEIT issue, appearing as a double issue. Nineteen authors illuminate aspects of this topic--of the peace policy of socialism, its economic consolidation and military safety to questions of socialist democracy, culture and way of life.

In his article, "Initiative for Peace," Herbert Krolikowski deals with the resolutions taken at the most recent conference of the Political Advisory Commission of the Warsaw Pact member states. The action program adopted there, the author states, demonstrates the fraternal socialist states' determination to preserve and continue, on behalf of safeguarding peace, detente and mutually advantageous cooperation.

In the next contribution, Stefan Doernberg emphasizes that today all peoples, all of human civilization, are beneficiaries of the socialist community's persistent peace policy. That in particular also showed the world historic magnitude of socialism.

Elsewhere in the issue, Hannes Hoernig deals in detail with topical tasks in college training, proceeding from the SED Central Committee Politburo college resolution. All deliberations and measures in this field should rely on the proven principles of the unity of training and education, teaching and research, and theory and practice. The tempestuous social and scientific-technical progress called for thoroughly educated graduates who could rapidly adapt themselves to new developments.

Hannes Hoernig in particular underscores the importance of independent scientific activity from the first day of studies and opposes regarding it as work "alongside" the training. Rather, "the creative, which typically determines the research process and implies doubt and searching for innovation, also must inform the acquisition of knowledge, the courses of study."

INTERNATIONAL CONFERENCE ON SOCIALIST HUMANISM EVALUATED

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 675-683

[Lead article by Prof Dr Gregor Schirmer, jurist, deputy chief, Science Department, SED Central Committee: "Socialism--The Real Humanism of Our Era: On the International Theoretical Conference of the SED Central Committee in Erfurt"]

[Text] This was the theme that governed an SED Central Committee international theoretical conference held on 29 and 30 May 1980 in Erfurt, on the occasion of the hundredth anniversary of the publication of F. Engels' work, "The Development of Socialism from Utopia to Science," attended by representatives of 31 communist and workers parties. The speeches and discussions focused on the following problems: Real humanism; tradition, ideal and reality; freedom, democracy, human rights; rationality and humanity; secure peace--the basic humanistic concern.

This was the theme that governed an SED Central Committee international theoretical conference held on 29 and 30 May 1980 in Erfurt, on the occasion of the hundredth anniversary of the publication of Friedrich Engels' work, "The Development of Socialism from Utopia to Science." Following the keynote speech by Hannes Hoernig, SED Central Committee member and head of the Central Committee' science department, representatives of 31 communist and workers parties, members of our party and representatives of other bloc parties in the GDR, broken down into three working teams, engaged in vivid exchange of opinion and experience, in which 49 speakers took the floor. Otto Reinhold, SED Central Committee member and rector of the Social Science Academy under the SED Central Committee, had every good reason to emphasize in his concluding speech that such comradely discussions of topical problems in social and political development bolster the fighting strength of the communist

world movement based on Marxism-Leninism and proletarian internationalism. The foreign guests, on the day preceding the conference, had the opportunity to familiarize themselves with enterprises, LPG's and communal facilities in Erfurt Bezirk and to talk with working people. Insights into our social practice gained thereby were reflected in various ways at the conference. Especially the comrades from fraternal parties in capitalist countries emphasized it had cogently demonstrated the humanistic character of the socialist social order.

Real Humanism

Socialist humanism is real humanism. It is inseparably connected with the historic mission of the workers class, discovered by Marx and Engels, to establish the classless communist society and thereby make peace the normal condition of mankind. Humanism thrives in the revolutionary struggle for this truly humanistic goal, in the irrevocable realities of socialism, created by the working people in the socialist countries, partly under extremely complicated conditions, through hard struggle and sacrificial work.

The policy and social practice of real socialism, its ideology, culture and morality, are the supreme expression of the humanistic ideas and aspiration of mankind. The speech itself put it like this: "The socialist countries have performed revolutionary transformations which in their essentials point the way for all mankind. Their evidence makes socialism the homestead for humanity, safety, freedom and democracy. The liberation from exploitation, from crises and unemployment, from the fear of tomorrow and of the future, the political power exercised by the workers class under the leadership of its revolutionary party and in alliance with the other working people, the socialist property, the citizens' comprehensive democratic participation in shaping the social processes, the comradely fellowship among people, and the friendship among the fraternal peoples--all these are achievements of fundamental importance. Socialism proves itself as the power that renovates everything and changes the social relations as well as men."

The representatives of the fraternal parties were agreed that thereby the working people in the socialist countries are accomplishing something which cannot be rated highly enough in all the scope it has for the humanistic future of mankind. Alfred Dewhurst, for instance, Central Committee Politburo member of the Communist Party of Canada, announced that the inability of capitalism to solve fundamental social problems was becoming all the more evident the more the attractiveness of socialist ideas was growing. Any denigration of real socialism only served the interests of capital. The representative of the Communist Party of Vietnam, Tran Van Chuong, emphasized that the true humanism of the Soviet Union and of the other socialist states served the peoples of the nationally liberated countries as a model in their struggle for constructing a better life, free from exploitation, and that consistent national liberation led to an ever growing trend toward the socialist orientation.

In contrast to the earlier humanism, which to be sure constructed desirable social conditions and ideals of harmonious personality without, however, being able to indicate how they were to be realized, socialist humanism derives its contents and objectives from social reality, explains them scientifically, and realizes them gradually to the extent that the real political, economic, social and cultural conditions are created for them in socialist society. That was brought home lucidly in the contributions by the representatives of the fraternal parties in the socialist countries.

The representatives of the CPSU and the SED, for instance, conveyed the experience that a classless society cannot be produced through an artificial elimination of social differences but that the social differences among classes and strata are historically necessary in developed socialist society and play a productive role. With the workers class playing the leading role, a process of rapprochement takes place among the classes and strata that amounts to a gradual reduction of social differences but also allows for the wealth of needs, the variety of interests and the differentiation in the working people's way of life. The realm of freedom, as prognosticated by Engels--as Mikhael N. Rutkevich, corresponding member of the USSR Academy of Sciences, pointed out--can be brought to realization only through stages in a penetrating process of social transformation.

The speech referred to two indispensable prerequisites for humanism in real socialism: First, the decisive step toward realizing socialist humanism in practical social life lies in the socialist revolution through which the workers class in alliance with the other working classes and strata seizes political power. Second, socialist humanism requires for its firm economic basis the public ownership of the means of production. "Without the leadership role of the party, without the political rule of the workers class in alliance with the other working people, and without the public ownership in the means of production," the speech stated, "nowhere in the world has thus far a socialist society been established. Without the further development of socialist democracy, without perfecting the socialist state including the steady consolidation of the defense capability of socialism, neither the people nor the individuals would have self-determination." As different as the forms and ways toward the construction of socialist society may be, with regard to this the representatives of the fraternal parties in the socialist countries conveyed identical experiences in enforcing these general inevitabilities. The representative of the Yugoslav Communist League, Rade Aleksic, defined the political power of the workers class and the public ownership in the means of production as the basic prerequisite for socialist self-administration in Yugoslavia.

In the contributions made to the discussion by the representatives of fraternal parties in capitalist countries it became clear that real humanism also is alive in the communists' struggles for the interests of the working people, for peace and social progress. Jan Wienecke, for instance, member of the executive board of the [West German] DKP, told

of the efforts of the FRG communists to boost the workers' fighting strength in the enterprises. What fails to be taken away from the monopolies--he said--cannot be given to the working people. If the working people in the FRG is to receive what is rightly its own, the power and privileges of monopoly capital must be curtailed and its influence must be forced back and, eventually, surmounted.

Tradition, Ideal and Reality

The new quality of socialist humanism and the insight into the limitations of all previous humanism does not give us a narrow view on our humanistic legacy and progressive traditions. On the contrary. We consider ourselves the true heirs of all humanistic aspirations and ideas of the past. We appreciate the deep wealth in ideas of the humanism in earlier ages, which often even then far transcended the barriers of any given class society. That we appropriate critically on the basis of Marxist-Leninist theory and we are developing it further, creatively. The humanism of antiquity, as expressed particularly in classical Greek culture, is as much a source in the history of ideas for socialist humanism as is the humanistic movement of the Renaissance, the humanistic content of the European Enlightenment and of classical German philosophy. British and French utopian socialism, combining the ideas of humanism with the socialist society to come, already marks the transition into the world of ideas of socialist humanism.

In Weimar, Buchenwald and Erfurt our foreign guest could convince themselves by what they saw there of how generously, and with how high and militant a content of ideas, our humanistic legacy is being preserved, fostered and disseminated among all GDR working people. This is how the speech put it: "The great humanistic idea that humanity raises itself through its work, that is, its own strength, from raw natural conditions to higher forms of society, culture and civilization, reason and morality, that humanity must work out and fight for its progress itself, as developed in various forms by such thinkers as Bacon, Hobbes and Locke, Voltaire and Rousseau, Lessing, Goethe and Schiller, Kant, Fichte and Hegel, Fourier, Saint-Simon and Owen, Belinski, Herzen and Chernyshevski, finds its comprehensive portrayal in socialist humanism, its theoretical grounding in the foundation of objective social inevitabilities and its progressive realization in the course of the establishment of socialist and communist society."

Our humanism draws from the sources of the past, implies an active attitude of life for coping with present problems and focuses on the high ideals for the future of scientific communism. In this context issue was taken cogently with slander from the enemy to the effect that real socialism does not accord with the communist ideals and theoretical predictions of the classic authors of Marxism-Leninism, for which reason a different, "more libertarian or more democratic" socialism should have to be created.

We communists have a dialectical conception of the relationship between the ideal and reality. Ideals always rush ahead of reality, exceed reality. The concern of party policy precisely is to implement our social ideals through the working people's activities. That precisely makes humanism politically effective and politics truly humanistic. That also implies our constantly testing the conformity between our reality and our ideals and constantly rendering our ideals more precise in accordance with our practical experience. Thus there is a productive interaction between ideal and reality. Socialist reality--as the author Helmut Baierl formulated it--bears features of the ideal, and the ideal, features of reality.

Our ideals, Hannes Hoernig explained, "are no transcendent speculations. The Marxists never have conceived the ideal as subjectivist, fantastic or normative-dogmatic. They always marked as their ideals their long-term goals and principles which ultimately are derived from the objective tendencies of inevitable social development. . . . In contrast and contradistinction to all idealistic interpretations, which either attribute a transcendent character to ideals or implant them in an individual conscience, Marxism regards the ideals as an ideological expression of specific socioeconomic conditions of the life of men or classes expressing, along with the present, also the elements of the future contained in them. The ideals of socialism, therefore, amount to the reflection in ideas of the real social interests of the workers class and its allies. In them are formulated the world historic aspirations of the workers class and all peace-loving and democratic forces as the desirable objectives and tasks of our struggle."

Our socialist reality is no unproblematic and ideal "final condition" but a historically young social order full of dynamics. That was mainly discussed by the representatives of the CPSU, BCP, PZPR and SED. It was brought out clearly that the developed socialist society is not without contradictions, especially in its formation process. The still inadequately developed productive forces are sources of contradiction, for example, between growing needs and the possibility of satisfying them. Among some of the working people socialist consciousness may lag behind temporarily because "birth marks" of capitalism and external influences by imperialism still exist for one thing, and also because such complicated tasks as making scientific-technical progress prevail and combining it with the advantages of socialism, furthermore, make very high demands on the working people's insights into the inevitabilities of our new social environment. The uneven state of development in the various socialist countries likewise produces objectively conditioned diverse interests in one matter or another. Not last, the complicated external conditions under which the socialist countries have to bring their ambitious goals to realization burden their struggle. The raw material situation, the world market situation and the increased expenditures for military security compelled by the arms race of the imperialists do not exactly render the systematic construction of the new society unproblematic.

While constructing the socialist society, in the USSR as well as in most fraternal countries, many complicated problems and tasks had and have to be solved which by origin belonged to the capitalist era. The countries of the socialist community have met these enormous tests. Pitting socialist ideals against the reality of socialism therefore is neither feasible nor theoretically tenable in view of the socialist countries' practical experiences.

Not the communists, as was emphasized, but the bourgeoisie has long renounced humanistic ideals, as it is indeed not able to bring them to realization. Bourgeois ideologists, as Jens-Peter Madsen, candidate of the Central Committee of the Communist Party of Denmark, clearly demonstrated, resort to new, so-called "concrete utopias," which are being pitted against real socialism, anticommunist and reactionary in their objectives and in line with the general trend toward irrationalism marking the intellectual life in the imperialist countries.

Freedom, Democracy, Human Rights

These concepts play a central role in the international ideological class struggles. Basically this involves the question which social order can guarantee a life of human dignity to the working people and an all-round development of personality.

Imperialism cannot do so. This was impressively demonstrated by James Eduard Jackson, Politburo member and Central Committee secretary of the U.S. Communist Party. He marked U.S. imperialism as the most pitiless form of capitalism at the present. Unemployment, racism like what happened in Miami, the urban crisis, inflation and other economic crises, foreign policy adventures such as the most recent intrigues against Cuba characterize the United States as a society sitting on a powder keg and going through some sort of a national disaster. As the representative of the leftist Communist Party of Sweden demonstrated, even countries under social reformist governments for years show the growing influence of the monopolies with all its reactionary consequences. The comments by Tom Redmond, deputy chairman of the Communist Party of Ireland, pointed out that still under the conditions of developed capitalism national oppression continues to assume cruel forms as in that of the British occupiers' military policy. One cannot speak of freedom, democracy and human rights under such circumstances.

Imperialism's human rights campaign has a most concrete background, which was unmasked above all by the head of the CPSU delegation, Isaak I Mints, member of the USSR Academy of Sciences. This is a campaign conducted through enormous financial means and on government orders against the historic fact that the realization of elemental human rights is the most pertinent concern on the part of real socialism. Socialism embodies the up to now highest historically possible developmental stage of freedom and democracy. That also, in particular, demonstrates its humanistic character.

In our republic the working people have the constitutionally guaranteed right and freedom to take part extensively in the shaping of political, economic, social and cultural life. In conformity with objective social inevitabilities, they may consciously and systematically, and thus freely, realize their common basic interests in peace, social justice and security, education and culture, and social relations marked by respect for human dignity and promoting the development of personality. Those are real freedoms and rights, which are being further expandened and deepened with the progress of socialist society. This was put in the speech as follows: "To the extent that one succeeds, while shaping the developed socialist society, in better controlling the natural and social conditions for the existence of society, in further developing the productive forces and more comprehensively satisfying the needs of the people, our real freedom will grow. The fundamental social, political and cultural rights and freedoms offered by socialist society, rather than surrendering the individuals to the uncertainties of the so-called labor market, guarantee the right to work, liberate them from subsistence anxiety and give them social security, eliminate their cultural backwardness and pave the way for them to all cultural treasures, rescue them from intellectual manipulation and facilitate their access to education and intellectual creativity. They give them every opportunity to develop their abilities and talents, develop into all-round educated personalities and also shape their personal lives deliberately in harmony with society."

Consciousness and creativity become all the more important the further socialism advances. Though socialism has existed only for a brief historic period, the changes that have come with it in the social position of man and in the character of social relations have already left clear traces in the intellectual profile of the citizens of our state: Self-assurance; the need for meaningful, creative activity; respect for a partner's dignity; openmindedness and participation in the "small and wider world" are the typical characteristics of the socialist sense of life. Such socialist virtues--as was shown in the speech and the discussion--could not have formed and prevailed of course without tenacious and bitter struggle against the force of petty bourgeois habits, egoism and individualism, irresponsibility and unconcern, lack of discipline and wastefulness, let alone the constant confrontation with the threats, calumnies and insinuations from the imperialist class enemy.

Live socialist democracy significantly helps form the socialist personality, develop its capacities beyond any immediate activity at one's work and thus create the subjective conditions for men to deliberately shape and control their process of social life. The speech conveyed the experience that the daily practice of democratic participation provides millions of people with the moral conviction their activity is useful and also that they are responsible to their work collective, enterprise collective and all of society.

Socialist democracy is no formal game. What is most important is that the possibilties and conditions are created and constantly further

developed for the working people to be able to take part in various ways and on all levels, in the people's representations, many social organizations and their enterprises, in the actual management of society. In this connection the discussion contributions by the representatives of the bloc parties met with vivid interests by the foreign guests. They refuted the enemy claim that those parties have no influence and only serve as a democratic facade. They demonstrated by means of many facts the independence of the bloc parties and their real possibilities for bringing to bear, in alliance with the leading workers class party, the interests of the citizens they represent politically.

Rationality and Humanity

In a world in which the scientific-technical revolution affects all historical processes there arises the question of course how socialism shapes its humanistic nature also with respect to economic necessities and social as well as intellectual-cultural consequences connected with scientific-technical progress.

In the speech the point was made that economic rationality and a humane management of labor conditions were not opposed to each other. Our party resolutions unequivocally focus on directly combining the rationalization and intensification of production with the improvement in labor conditions, the enhancement of labor culture and, primarily, progressive changes in the content of work, to provide more space for personality development. There are naturally still many unsolved problems in this area; heavy physical and hazardous working conditions have not yet been fully eliminated, and new technology at times brings with it monotonous work. Great advances have however already been made. Since as recently as 1971 almost 2 million jobs have been reorganized in industry, construction and transportation so as to further develop the socialist character of labor and its creative elements.

It is part of the humanism in our society that we produce under dignified human conditions and that our production itself aims at dignified human goals, which lie in the ever improving satisfaction of the people's material and cultural needs. That has been served by the unity between economic and social policy, and from it the GDR citizens have gained enormous social achievements for which the foreign guests at the conference expressed great respect. They rated our party's long-term social program as socialist humanism in action.

Our citizens know one must work hard for social improvements which, in turn, depend on o[illegible] economic efficiency, and it depends primarily on the acceleration of our scientific-technical progress.

The further shaping of the developed socialist society calls for more effectively combining the advantages of socialist society with the scientific-technical revolution. That includes, as the speech explained,

controlling, and humanistically shaping, scientific-technical progress for the good of man: "The use of microprocessors, the introduction of new technologies, substituting for traditional raw materials and material and many other results of our scientific-technical progress do not, under socialist conditions, threaten the working people's social security. They do naturally also confront our society with complicated problems. Also among us the working people have to submit to retraining to work themselves into novel and often complicated fields of work. In contrast to the working people in the profit-oriented capitalist society they do so, however, in an atmosphere of safety and social security because the socialist society manages these complicated processes in a manner that conforms to socialism and socialist humanism.

Scientific-technical progress, economic rationality and higher efficiency pose no opposition to socialist humanism. Rather they are decisive means for progressively realizing this humanism and are themselves subject to the criteria of socialist humanism. That forms the objective foundation for a positive attitude toward scientific-technical progress on the part of the overwhelming majority of the GDR working people. Among us one will hardly ever meet capitalism's widespread pessimism with regard to technology."

The Marxist-Leninist conception of the productive forces, of science and technology as revolutionizing factors of history thus, under socialist production relations, is tied in with the conception of socialist humanism. As Friedrich Engels wrote, the increasingly faster progressive development of the productive forces freed from the fetters of the capitalist mode of production leads to the "possibility to ensure an existence for all members of society by means of social production which not only is completely adequate materially and becomes richer from day to day but which also guarantees to them a completely free training and exercise of their physical and intellectual proclivities."[1]

Secure Peace--Basic Humanistic Concern

Securing the peace as a precept of socialist humanism calls for active deeds in implementing this great ideal of humanity. This idea and the connection between socialism, real humanism and peace—as cogently explained in the speech--characterized the entire conference. Thus the leaders of the working teams, Erich Hahn, Harald Neubert and Hans Koch, reported unanimously that during the debates the humanistic character of real socialism was mainly derived also from the resolute peace policy of the Soviet Union and the other socialist states.

One cannot speak of socialist humanism without remembering that the Soviet Union had the main share in the destruction of fascism and thus in the liberation of humanity from that inhuman barbarism. That was an acid test and victory for socialist humanism over antihumanism that has its deepest roots in the imperialist social system.

One cannot speak of socialist humanism without emphasizing that it has been the power of real socialism, primarily that of the Soviet Union, that has prevented imperialism for three and a half decades by now from unleashing a world war and has put out many a hotbed. The conference participants fully endorsed the following statement in the speech: "No imperialist lie of an alleged threat to peace by the Soviet Union can alter the fact that socialism due to its very nature, its social goals and its fundamental interests needs peace and produces peace. There are no forces in socialist society whose interests would conform with rearmament and war, which would profit from war. In fact it needs peace because it can attain its far reaching sociopolitical goals only through peace and the peaceful work of construction. No propaganda of expediency can hide the fact that imperialism inevitably makes for war, that the military-industrial complex constantly pushes the arms race to drive profits up, and that the most reactionary forces of imperialism are bent on finding a way out from their crisis in military adventures and on stopping by force the social progress of humanity."

One cannot speak of socialist humanism without paying tribute to the rigorous and sacrificial struggle by the communists in capitalist countries for peace and detente, against the aggressive policy of U.S. imperialism, against the neutron weapon and the production and stationing in Western Europe of new American missiles, and against the higher military budgets in the NATO countries. The representative of the Communist Party of the Netherlands, for instance, reported the struggle against the neutron bomb and NATO's missile resolution has turned the peace movement into a broad mass movement. Through mobilizing the broadest political and social forces in the joint struggle for peace new alliance possibilities open up, which also include forces that are politically far removed from the workers movement and that are joining the peace movement for ethical reasons, while they may have utopian notions, certain illusions about the causes for mobilization and the social content of the disarmament struggle, or even anticommunist reservations.

Finally, part of the socialist-humanist position is the realization that the most reactionary circles of imperialism have lately started a general attack upon peaceful coexistence by wishing to alter the military balance of power unilaterally in their own favor by increased armaments, are deliberately exacerbating the international situation and proceeding toward a policy of confrontation, blackmail and threats. The representatives of the fraternal parties were agreed--and this was in line with the Paris appeal of the communist and workers parties of Europe--that the offensive has to be taken in the struggle against those aggressive circles.

Mainly the representatives of the communist parties in the United States, Vietnam, Cuba and Japan analyzed in this context the aggressive intentions of U.S. imperialism and its Carter Administration and the collusion with the Chinese hegemonists. Hiroyuki Okamoto, member of the Central Committee Presidium of the Communist Party of Japan, speaking of the freedom

of the nations, unmasked the policy of the Carter Administration as a policy of strength aiming at reconstituting U.S. military and diplomatic supremacy on the global scale and reestablishing imperialist rule over other nations. He assessed the relationship between China and U.S. imperialism as mutual support for their respective hegemonistic and aggressive designs and from that derived the need for fighting against the Chinese aggression in Vietnam, the policy of extortion of Kampuchea, and the encirclement of the three Indochinese countries by the alliance of China, the United States and Japan.

In concluding the scientific conference in Erfurt, Otto Reinhold stated that the work of Engels, the hundredth anniversary of which had brought together representatives of communist and workers parties in Erfurt, had remained vital and topical as all the other works by the classical authors of Marxism-Leninism. Thus the conference was no mere commemorative event but a militant contribution to one of the most significant issues in the ideological confrontation of the present. Socialist humanism will continue to be given central attention in the theoretical and propaganda work of the communists.

WARSAW PACT PEACE INITIATIVES REVIEWED, EVALUATED

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 684-690

[Article by Dr Herbert Krolikowski, member, SED Central Committee; state secretary, first deputy minister for foreign affairs: "Initiative for Peace"]

> [Text] The Warsaw Pact states, 25 years after founding their peace alliance, in Polands' capital once again took the initiative for safeguarding peace. In view of the dangerous exacerbation of the international situation brought about by the most aggressive forces of imperialism, they continue their socialist peace policy vigilantly and resolutely and are proposing a constructive action program to all states and peoples on stopping the arms race and eliminating the danger of war. At the same time they are taking those measures which, in the interest of their own security and of that of all peoples, ensure the defense capacity they need at all times.

For good reasons the peoples all over the world are watching the course of international events with special attention in these weeks and months, for this, after all, is a question here that affects the life of all humanity directly: Will we succeed in preserving and deepening international detente or is the world going to be thrown into the vortex of adventurous confrontation policy, engaged in by the ruling circles of the United States and other NATO states, with all its dangers to peace and thus to the life of the nations. Through the new initiative by the Warsaw Pact states, adopted at their most recent conference on 14 and 15 may this year in Warsaw, the progressive and peace-loving forces in all countries place their hopes in a recovery of the international situation, the elimination of threatening hotbeds of war and, thus, mainly in preventing the danger of a nuclear conflict, which would of necessity assume a worldwide scope.

In Warsaw, the city that was subjected to unspeakable suffering in the fascist world war, where in the spring of 1955 the socialist countries of Europe sealed their uniting into a resolute peace alliance by signing their "friendship, cooperation and mutual assistance treaty," they now, 25 years later, again took the initiative for further safeguarding peace. The world political importance of the Warsaw proposals lies, not last, in that they point out the way to detente and peace to the nations at a time when the forces of imperialism and hegemonism, through their adventurous course of the arms race and confrontation, are conjuring up serious dangers to world peace.

The Warsaw Pact states consistently pursued the historic peace course in Warsaw which real socialism has been taking since the hour of its birth in 1917 and which for a quarter of a century has proven their defense coalition a factor of peace, and this not only in Europe but all over the world. They had every good reason to announce at their anniversary conference that their socialist alliance serves peace and nothing but peace. Therein, after all, lies its eminent political strength. In the outcome of this tenacious and purposeful work by the states united in the Warsaw Pact, profound changes have occurred in international relations that are providing recognition for the interests of the peoples and more and more respect for reason as they already have been vested in many mandatory enactments under international law.

The main concern of the Warsaw conference of the Political Advisory Commission in 1980 aimed at the preservation and deepening of detente. How could it have been otherwise? The action program proposed at this conference offers a real chance of preventing international relations from being once again dmoinated by the spirit of cold war and from "propelling mankind toward nuclear world war under the impact of imperialist machinations."[1] It points the way to reinforcing trust, understanding, a permanent peaceful juxtaposition and salutary international cooperation.

"In the present complicated situation," of which Comrade L. I. Brezhnev spoke in Warsaw, "when millions of people worry about the fate of detente and peace,"[2] the proposals contained in the declaration and the announcement will leave clear traces all over the world. The fraternal socialist states, in their initiatives, confirmed their intention smoothly to continue the development of their mutual advantageous relations with the capitalist states in all fields and actively to cooperate with all states in solving the burning issues of our time. They made clear once again that peace and socialism are identical. At the 12th SED Central Committee plenum, Comrade Erich Honecker said about this policy which is being pursued by the allied socialist states: "Peace holds the uppermost position among the goals pursued by our socialist alliance with its coordinated foreign policy, relying on the unity of action among its member states, and in cooperation with all forces of good will on earth."[3]

That is the goal pursued by the foreign policy effort of socialism from its very beginning. In the mid-1970's it became especially clear that this policy was meeting with success, and mankind began to realize that it need not look at the cycle of war-peace-war as if it were decreed by fate.

Imperialism Has Aggravated the International Situation

"The transition from detente to confrontation the U.S. administration is encouraging, and into which it also means to drag the West European NATO countries, has considerably aggravated the international situation."[4] There arises the question where the causes for it have to be sought. Are these short-term operations or is it an objective posed for long term? And what is the implication for the destinies of the nations?

Even at their previous conference in Moscow in 1978 the Warsaw Pact states pointed out that massive attacks against detente were being undertaken by the forces of imperialism and reaction, that they were rekindling the arms race, interfering in the internal affairs of other states and seeking to subject independent states and peoples to their rule. The socialist states have always warned of such developments. In all seriousness it must be said that the international situation has been significantly aggravated--as shown by the Warsaw conference--and that the dangers for peace and detente have grown considerably.

The most aggressive imperialist circles evidently are not willing to accept the consolidation of the positions of socialism, the successes of the peoples in the young national states with their national liberation struggle, and the growth of the democratic, progressive forces in the capitalist world. They seek to push world events in a different direction. Detente and peace, which are furthering social progress in the world, are not agreeable to those forces. They "care for raw material sources, political and military-strategic positions, spheres of influence, and maximum profits."[5] Another factor--closely connected with it--is that in the imperialist countries the effects of the crisis keep weighing more and more heavily on all domains of economic and social life.

Those are the main causes for the exacerbation of the international situation, for the imperialist crusade against detente. Aggressively, they are making the useless attempt of interfering with the objective course of events, to reverse things and accomplish a development that would be in favor of imperialism.

Through activating the imperialist confrontation policy and a feverish mobilization of the NATO states, their deepening of political and military cooperation with China, an ever more aggressive military thrust in Asia, from the Indian Ocean to the Persian Gulf, and in Africa, and through steadily piling up unresolved international problems, imperialism attempts a counter-offensive against socialism, peace and progress.

As Comrade Erich Honecker, mindful of historic experiences, stated at the 12th Central Committee plenum, it was "not the first time for imperialism to seek for a way out of the crisis of its own system by means of military adventures."[6]

Irrefutable facts such as the unscrupulous demarche by the United States against the people's revolution in Iran--the so-called commando raid as well as military maneuvering by the United States in the Persian Gulf area--, its undiminished aid to Israel's terrorist policy of occupation and aggression, the steadily increasing interference since the April revolution of 1978 by U.S. imperialism and reactionary forces of other states in Afghanistan, but also China's attack on Vietnam factually carried out with U.S. approval and the persistent, latent danger in that region--all these facts openly attest to the brutality of the imperialist and reactionary forces. They amount to undeniable evidence for the seriousness of the situation that has arisen.

The long-term strategy of the most aggressive imperialist circles is equivocally proven, above all, by NATO's ratifying the long-term high mobilization program in May 1978, the fateful Brussels missile resolution and the nonratification, by the United States, of SALT II.

The conference of the NATO defense planning commission on 13 and 14 May 1980, held approximately at the same time as the conference of the Warsaw Pact Political Advisory Commission, concentrated on expanding NATO's operations area and on accelerating the long-term armaments programs decided on in 1978/79. An immediate program was adopted with the purpose of releasing NATO troops of the United States for employment in other regions of the world, especially for expanding the U.S. presence in the Indian Ocean and the Persian Gulf. The United States demanded an extra DM 10 billion, short-range, for escalating the arms race and the annual budget increases for all NATO states, decided on in Washington, by from 3 to 4 percent.

The socialist states will not sit idly by, of course. At the Warsaw conference, the necessary foreign policy steps were correlated and those measures were agreed on that will ensure the necessary fighting strength of the socialist military coalition's united armed forces.

NATO policy often has been and is being justified by a "threat from the east" or the "Soviet danger." Recently they will especially resort to Afghanistan and the events around Iran to justify by this historically long unmasked lie their own mobilization, their adventurous policy of military threats and their drive for military superiority. The worsening of the international situation has its origin however neither in Afghanistan nor in Iran, but the most reactionary imperialist circles, and especially the ones in the United States, are without any doubt responsible for it. Who threatens whom, and in what way, is revealed by the mere fact that the NATO long-range mobilization program and the deployment of new types of medium-range missiles in Western Europe are matters that were decided on before the events in Afghanistan occurred and despite urgent warnings by the socialist states.

The Constructive Detente Concept of Socialism

The Political Advisory Commission of the Warsaw Pact presented a constructive program at its Warsaw conference for the decisive questions pertaining especially in the current international situation to the safeguarding of peace. Concrete goals and approaches were presented, as Comrade Erich Honecker explained at the 12th SED Central Committee plenum. "We are," he said, "not in favor of breaking off but of continuing the dialog between east and west, south and north."[7]

That conforms also to the proposal in the declaration by the member states for a meeting on the highest level among the leading representatives of states in all regions of the world. This amounts to establishing the possibilities "for a direct dialog among statesmen of various regions aiming at the safeguarding of peace and cooperation among the peoples and preventing the danger of an atomic catastrophe for mankind."[8] That meeting is meant to be neither a substitution for the world security council nor for the UN General Assembly--as some Western mass media have claimed. The many meetings in Belgrade and the meeting between Comrade L. I. Brezhnev and French President Giscard d'Estaing in Warsaw, brought about by the invitation of the first secretary of the PZPR Central Committee Comrade Edward Gierek, have emphatically underscored how useful meetings are in the sense of this proposal by the Warsaw Pact states. There also accrues a special place value in this context to the meeting between Comrade Erich Honecker and the FRG Chancellor Helmut Schmidt in Belgrade. The Soviet Union and the other socialist states, in implementing the Leninist foreign policy, especially in the current complicated international situation, leave no stone unturned in counteracting any further exacerbation of the international situation. It is in line with the nature of the socialist peace policy that especially the Soviet Union brings its great political weight to bear on carrying on, in the interest of all peoples, the only reasonable course of detente.

The overall results of the May conference of the Political Advisory Commission of the Warsaw Pact demonstrated the determination of the fraternal socialist states to preserve and continue detente and mutually advantageous cooperation in the interest of peace in Europe and beyond.

As points of major emphasis for military detente in Europe, the Warsaw Pact member states focus on the consolidation and expansion of confidence forming measures, the renunciation of the use of force or threat of force, the limiting solely to defense needs of the armed forces and armaments of each state or group of states, and the mutual renunciation of attempts to gain military supremacy. They once again declare "that they have never striven and will not strive for military superiority. They consistently stand for the military balance being secured at ever lower levels, for the scaling down and elimination of the military confrontation in Europe."[9]

The socialist states are prepared to negotiate on any types of weapons. Their program comprises all essential aspects of military detente--the reduction of nuclear and conventional arms, accords on further confidence-building measures and political-legal steps to diminish the danger of war and strengthen the guarantees for the security of the states on our continent.

The implementation of the concrete measures proposed would mean a real increase in security for all European countries and contribute to the strengthening of confidence among them and to the cooling off of the political climate on the continent.

The Warsaw Pact states emphatically call on the Western countries to use the favorable conditions and possibilities their fair proposals have created for effective measures toward military detente and to avoid any acts that would undermine the process initiated by CSCE and block disarmament negotiations.

The socialist states represented at the Warsaw conference once again urgently appeal to the NATO states to refrain from the decision, fatal as it would be for the peace of Europe and the entire world, to produce and deploy new types of American medium range nuclear missiles in Western Europe. The results of the most recent conference of NATO's nuclear planning group indicate however that the United States and its allies seek to ignore this appeal and European public opinion. Though the Warsaw Pact Political Advisory Commission has appealed for proceeding through negotiations while respecting the security needs of both sides, the NATO states in Bodo once again ignored this call and set down measures that amount to an accelerated implementation of the missile decision of Brussels. To make negotiations possible, however, it would be necessary to cancel that decision or do away with all measures for its implementation.

As a practical course for agreeing on measures in military detente, the socialist states represented at the Warsaw conference reiterated their proposal to summon an all-European conference on military detente and disarmament on the political level. This is a realistic proposal which is topical and tied to deliberations and ideas of other states. The Warsaw Pact states are focusing on a speedy beginning of the practical preparations for that conference and have proposed Warsaw as the place where the conference should be held. They favor intensifying an exchange of views on the concrete questions with respect to the preparation of that conference and conducting consultations to that end among the representatives of the CSCE participants. At the Madrid conference agreements could be made about the time, place and working procedure of that conference, including its first-phase agenda.

The Madrid conference of the CSCE participants must occupy an important place in the struggle for the defense of peace and for consolidating and

and extending the results of the detente process achieved in the 1970's. The socialist states in Warsaw have once again reemphasized that they resolutely and with determination advocate for the Madrid meeting, to begin on 11 November 1980, to advance the security and cooperation in Europe and make progress particularly in the field of military detente. The Madrid meeting should then pick up those positive experiences and results that have been achieved in the last 5 years in implementation of the Helsinki Final Act.

An Action Program of World Political Scope

The socialist states place great importance on the objective of turning detente and disarmament into a worldwide process. Their Warsaw declaration, along with the appeal, proposed a concrete action program. Along with the ratification of SALT II, the following tasks are the centerpiece of their recommendations on stopping the arms race:

The speediest possible completion of negotiations on the general and complete prohibition of nuclear weapon tests, of radiological and chemical weapons, and on the non-use of nuclear weapons against non-nuclear states which do not have them on their territory; immediate start of negotiations on concluding a world treaty on the non-use of force, ending the production of nuclear weapons and the gradual reduction of their stockpiles all the way to their complete abolition, on a ban on the development of new types and new systems of weapons of mass destruction, and on the reduction of military budgets, above all those of the major powers; and on the start of negotiations on limiting and scaling down the level of military presence and military activity in the Atlantic, Indian and Pacific Ocean, the Mediterranean and the Persian Gulf.

The Warsaw Pact states are always ready to establish contacts and conduct a constructive and businesslike dialog on the substance of these proposals with all interested states. At the same time they delcare their readiness to examine attentively any proposals by other states on the consolidation of peace, the ending of the arms race, and disarmament.

Proceeding from their often reiterated desire to extend detente to all regions in the world, the socialist states in the Warsaw declaration have reconfirmed their standpoint of resolving permanently and justly by political means any international conflict situations threatening world peace and international security. They are indicating concrete ways for doing so in considering that the elimination of sources of tension and producing real steps toward military detente are mutually inseparable tasks.

The conference of the Warsaw Pact Political Advisory Commission had proven once again that the states participating in this defense coalition are fully aware of their great responsibility and approach the solving of the cardinal issues of international life with determination. Through

their businesslike and clear proposals they refute the claims made by imperialist politicians and the Peking leaders that detente had been deadlocked and the possibilities had been exhausted for finding political solutions for complicated international problems. The documents unanimously adopted at the Warsaw conference amount to concrete and feasible recommendations for solving the questions crucial for all, which in the current international situation have bearing on the safeguarding of peace, whereby they constitute a constructive concept of ensuring peace also for the 1980's. Once again the Warsaw conference has demonstrated that the policy of the fraternal socialist states knows neither fluctuations nor inconsistency. It always is deeply and unerringly committed to peace and social progress.

Through the unaminous adoption of the Warsaw documents the Warsaw Pact states have once again placed the great weight of their alliance in the scale of peace and international security. As in the last 25 years they will continue to work with all their strength in the future for the noble goal of socialism of freeing mankind from the scourge of war. The Warsaw resolutions are aimed at fulfilling the peoples' hopes for peace and a life of happiness.

TRENDS, SUCCESSES OF 'SOCIALIST WAY OF LIFE' ASSESSED

Effective Ideological Motivation

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 713-721

[Article by Prof Dr Harry Nick, economist, research program director, Institute for Political Economy of Socialism, Academy of Social Sciences, SED Central Committee: "Social Security as Achievement and Task"]

[Text] In socialism, social security belongs among the basic characteristics of men's way of life, in capitalism, social insecurity. What is social security based on, what are its characteristics, how does it relate to individual freedom, and which role does work play in ensuring it? What is to be done so that the impulses resulting from social security become highly effective?

Unmistakably, the interest in questions and problems concerning men's quality of life on the whole has grown immensely in the recent past, and this in all parts of the world. The terms "way of life" and "quality of life," which stand for the totality of the forms of human activity in life, for the meaning given to human life, have acquired a firm usage in political and social science vocabulary. It attest to penetrating and far-reaching changes, mainly in the objective conditions and factors of human life, that the questions about what a certain social order, certain social forces and political programs, can or want to effect on the whole for improving human life are now raised more emphatically than they used to be. In line with the experiences of people in the ordinary development of our socialist society Comrade Erich Honecker, at the 12th Central Committee plenum, emphasized the magnitude in the changes of our people's life during the last decade. Socialism in our republic has "a considerable measure of maturity, internal stability and also effectiveness externally."[1]

The people's material standard of living has risen greatly in the 1970's. We almost completed equipping our households with their first durable consumer commodities like television sets, refrigerators and washing machines. That was the decade in which we, however, also completed the transition to the general education polytechnical secondary school, and important advances were made in all fields of intellectual-cultural life. Important things were accomplished in the implementation of the most extensive sociopolitical program in the history of our state which guarantees for all people a high degree of stability and of security in their social conditions of life. All this has penetrating effects on the totality of men's living conditions, their way of life, which mainly also includes that the emphasis has in this field also shifted more clearly still to the qualitative factor. The important thing is to ensure what we have achieved at a rising qualitative level and to take account of the grown qualitative demands for consumer goods and services, which includes satisfying the growing demand in high-grade consumer goods. All this is part and parcel of the task "to ensure what has been achieved thus far and continue gradually elevating the people's material and cultural standard of living."[2]

The growing weight of the qualitative aspect of the people's way of life also means of course that the interaction between the material and the intellectual-cultural conditions of life is becoming more intensive, the specifically socialist quality of our way of life becomes more pronounced, and thus the questions about the factors and conditions that determine the particular quality of the socialist way of life overall, in all basic forms of human activity, become more important and meet with increasing interest.

In the developed capitalist countries a great number of contradictory processes and phenomena lend a greater weight to the questions about the quality of life:

The objective reproduction conditions of labor are changing. Scientific-technical progress, increasing labor pressure and other factors have the effect that health care and training and advanced training gain greater importance objectively. Thus the range of demands the workers class raises in its confrontation with the capitalists must increasingly get wider and go beyond wage demands. There simply are demands which concern the important aspects of the quality of life in toto.

Experience has shown that even a high material standard of living on the part of broad strata will not eliminate the social evils of capitalism, the worry people have about their elemental conditions of subsistence. There is increasing tension within the web of the people's social relations. Even when someone does have a relatively high material standard of living, he is not freed from anxiety and must fear to "crash" socially. And someone who is being courted in business and by advertising--and this all the more persistently the more difficult economic growth

becomes--, but must knuckle under at work and--consequently--away from his job as well,[3] finds out practically that there is more to a good and meaningful life than high real wages.

Finally it must not be overlooked that the much overused catch phrase of the "quality of life" in capitalist countries constitutes some sort of modern "supplication of heaven" and in a very demagogical fashion is offered as a substitution for unsatisfied demands for improved material living conditions. The thesis that "man does not live by bread alone" is then turned into the demand they should not ask for higher wages and not only look at the material side but have more respect for the "inner values." It has nothing to do with truly improving the objective conditions for a finer quality of life.

In contradiction to the constant claims by bourgeois ideology that men's general value orientations are for all intents and purposes identical "in east and west," and that the concrete forms of life primarily depend on the income level and are subject to the general scientific-technical level, it turns out that the essential qualitative criteria for men's way of life in capitalism and socialism diverge more and more. This results from the fact that the opposite specific inevitabilities working at the depth of the social processes, and thus of men's ways of life, are becoming more and more pronounced and increasingly affect the concrete forms of life. Among the most important of these conditioning inevitabilities which penetrate the entire way of life is men's social security under socialism and the equally objectively conditioned social insecurity in capitalism.

Social Security, an Essential Part of Socialism

Social security is a basic criterion for men's way of life, a general criterion effectively qualifying all vital areas, resulting from the essence of socialism. It profoundly affects men's spirit of life, their sense of personal value, the quality of their interhuman relations, the totality of the advantages and impulses of our socialist order. It is among the decisive general criteria of the socialist way of life and one of its historic advantages.

Social security has been and remains a basic element of the socialist idea, an irrevocable goal of the revolutionary workers movement. It is a task of such a high rank that one surely may say: The objectively historic necessity of socialism, its deep moral justification are essentially to be derived from its ability to tap the potentials of the modern productive forces for the enrichment of human life, and this for all members of society. As long ago as in 1845 Friedrich Engels reasoned for the social concern of socialism by saying it would "create for all people a life situation where each can freely develop his human nature, live in a human relationship with his neighbors and need not fear any violent upheavals in his life situation."[4]

Certainly there are some external similarities, differences quantitative in kind in the materially objective and also in some social living conditions of men in capitalist and socialist countries. But as far as the social security for working people is concerned, the difference existing is elemental and general: it exists in socialism but not in capitalism.

No one will deny that in capitalist countries also there are improvements in men's social living conditions and advances in education, health protection and so forth. Yet these are no achievements of capitalism. On the contrary, they have to be bullied out of capitalism. In socialism, social progress results from the nature of this mode of production, but not so in capitalism. There social improvements have to be gained by the working people in bitter struggle against monopoly capital. And these achievements of their struggle are always in jeopardy; even to preserve them they have to struggle stubbornly. And they also always only concern particular aspects of men's living conditions. Social security is unobtainable in capitalism.

Social security is indivisible. Either it exists for all members of society or not at all. Unemployment, for example, in no way means that only the directly affected segment of the people who are able to work has become socially insecure. The fear of becoming unemployed has still more devastating effects on the totality of men's living conditions; this fear affects those who are working. They are the ones who must knuckle under and whose human dignity is besmirched each day.

It is an expression of the humanistic nature of socialism that it truly brings about the elevation of the material and cultural living conditions of men for all, for every individual. This term, "for all," is underscored time and time again in the works by the founding fathers of Marxism-Leninism and in our party documents when the goals and ideals of the workers movement come under discussion. Capitalism, Karl Marx wrote, makes for the sort of "development of the social productive forces and the creation of material production conditions which alone can form the real basis of a higher form of society the basic principle of which is the full and free development of each individual."[5] And Lenin stressed as the goal of socialism "ensuring the highest welfare and free all-round development of all members of society."[6]

These statements also make clear what we have to understand as social security in socialism. Social security of course means protection for everyone from material hardships and hunger, and from "violent upheavals of his life situation," that is social security at old age, in the case of illness and so forth. Even these elemental social securities do not exist for all people in any capitalist country. But social security means more than that:

It means the certitude that the material and cultural standard of living rises subject to the growing material and intellectual wealth of society and one's own performance. This fact it is to a large extent that makes

for the social optimism of men in socialism. And its weight is all the greater, the more far-reaching the changes are that are caused by the progress of science and technology and are signaled for the future.

In other words, social security is not confined to the material conditions of life. Real socialism eliminated illiteracy as fast as hunger. In the intellectual-cultural field--the level of education, the variety of men's intellectual-cultural needs and the prerequisites for their satisfaction--socialism has outdistanced the developed capitalist countries by miles.

The self-awareness and world-awareness caused by the security of the social conditions of life of men and their sovereignty in structuring their individual spheres of life and in dealing with other people are powerfully being bolstered by political and ideological factors. This sense of security also stems from the fact that every citizen of a socialist country can simply take it for granted that his state will do the utmost for safeguarding the country and the peace in the world, and for promoting the forces of progress and national independence. The internal stability of the political system in the socialist countries and the evidently increased instability in the political system of many capitalist countries play a great and increasing role in reinforcing the sense of social security in socialism.

Social Security and Freedom

To the extent that people come to recognize more clearly social security in socialism and social insecurity in the capitalist countries as an essential criterion for differentiating between social systems, bourgeois ideology is making greater efforts at not only deprecating or even stigmatizing social security but at presenting it as a negative value. This in every way is based on the centuries-old theoretical-ideological tradition of bourgeois economic liberalism, the basic tenet of which is that the principle of competition, the carrying out of opposing interests of men purportedly caused by the natural egoism of men ultimately produces the best result for society, and it is understood that this mechanism in competition implies the right to private property and the contrast between the poor and the rich. The idea of social equality and social security is of course alien to that concept.

Only during the short span of time when the bourgeoisie, because of a relatively high rate of economic growth over a longer period, gradually began to believe in its own convenient lie that capitalism had managed to control the problems of economic growth, its ideologists indulged themselves in the notion that capitalism could ensure social security, "welfare for all." That also was the title of a book, and its author, Ludwig Erhard--praised by FRG ideologists as the father of the "social market economy" to this day--, has meanwhile, when times got worse, departed rather quickly from those notions. He incessantly warned

against those who "do not want or cannot understand that by their demand for 'more social security' . . . they grant the state increasingly more rights to interfere in their private sphere whereby they will at long last become totally dependent on the collective."[7]

The price for social security is the loss of individual freedom--that, roughly, is a main argument bourgeois ideology levels against socialism. No longer, however, can they deny that socialism--and only socialism--can ensure social security for all. "If the citizens in Western states realize these preconditions by which communism knows of no unemployment problem they hardly will want to see those preconditions be brought to realization in the West," an entrepreneurs publication has said; each would "be employed by the state wherever he is needed in accordance with state economic plans," there was no freedom in choosing one's trade, no choice of a job and so forth.[8]

Unemployment and the fear of unemployment have grown. Since the 1974/75 crisis monopoly capital but the working people in the capitalist world as well have to live with the idea that massive unemployment has become permanent and the risk of increasing unemployment is very real. As the 1929/33 world economic crisis proved as untenable the preferred argument advanced by bourgeois ideology that the workers themselves had to be blamed for unemployment--"he who wants to work will find work, too"--, the explanation under today's condition that unemployment is the price for certain other advantages of the "market economy" turns out to be just as cynical. And then there is nothing left actually but trying to belittle the effects of unemployment as such. That in turn ultimately is possible only when the role of work as the most important human life activity, as the basis for man's existence and the field in which his personality forms is disparaged. And this also is precisely the direction followed in recent times by purposeful efforts on the part of bourgeois ideology. The question is being raised, for instance: "Are we running into a crisis for the meaning of work? Is the vital value of work confined henceforth to hobbies?"[9]

Among the answers one finds claims that "for the individual, personal work to assure his existence no longer is necessary."[10] How is that explained? "The unemployed, after all, keep alive too!" That no doubt is the most radical remedy bourgeois ideology could want to prescribe for common sense which regards unemployment and subsistence security as incompatible. Especially in connection with the effects of microelectronics, robot technology, which no doubt will further increase the social insecurity in the capitalist countries, the media in those countries loudly ponder the thought whether there is much work at all that would "constitute a value as such." And then they say "most people do not care for their work as such" but only for their income. That is why one should not engage in employment therapy but think about distribution questions. Pictures are being drawn that show how the robots do the work and the unemployed are "lying in the sun."[11] At the conference on "Socioeconomic Problems and Application Possibilities for Microelectronics in the Labor Process" (September 1979 at Zandvoort, Netherlands) the question was raised how men could be furnished with a new sense of life

when this life no longer is based on work.

There is nothing novel at all of course in the idea of keeping some of the people, who cannot be assigned to useful activities, happy by "bread and the show of the circus." That idea was born during the decline of the Roman Empire, nearly two thousand years ago. Evidently, all that has been referred to here essentially has nothing to do with the effects of technology, is not a general "identity crisis of labor" but rather a crisis in the existence of the exploiter order.

Such arguments obviously are due mainly to the effort of counteracting the growing realization that social security counts among the highest social values, that it affects all areas of life, and that it is prerequisite to realizing actually all social basic rights--the right to work, to education, recreation, old-age care and health care, the right to a free choice of occupation, and of the job--, and that social security is one of the essential factors causing the qualitative superiority of the socialist way of life.

Social security is indispensably prerequisite to personal freedom. It alone makes it possible for the individual to plan and purposefully pursue what he wants to do in life and to make a success of it together with others, by carefully balancing his own inclinations and abilities against social requirements and possibilities. However brutally it may want to falsify reality, bourgeois ideology will not be able to obscure for any length of time the fact that men under the conditions of social security in the socialist countries possess vastly greater choices with respect to their occupation, their level of education and their jobs.

The sociopolitical model of a "social and free market economy" which has been hailed for decades, mainly by FRG ideologists and politicians, assigns a central spot to the claim that this market economy--in contradistinction to the planned economy--makes possible the freedom to choose what one wants to consume and one's occupation and job, and this presumably thanks to the beneficial effects of the market mechanism which, in an efficient and most elastic fashion, would keep economic magnitudes constantly in equilibrium through the constant balance between demand and supply. Nothing need to be said here about how the market regulates production, which really functions most miserably.[12] But as to the labor market, labor as a commodity--which Karl Marx demonstrated long ago--, there always is a shortage of jobs and an excess in the supply of manpower. Not only that the worker in capitalism cannot get away from the capitalist class, from exploitation, in addition he is supposed to be grateful to an individual capitalist for being allowed to work for him and to be exploited by him. Not the worker has a choice but the capitalist has one in that he can select from the excess supply of manpower those he deems most suitable, those who will diligently produce surplus value.

The possibilities for choosing a trade and a job are most rigorously curtailed in times of crisis, much more so in fact than indicated by unemployment figures, for instance. If more than 20 percent of the school

graduates cannot find an apprenticeship at all, a higher percentage still there will have been most likely that simply took any training job that was available. The same holds true for one's regular job. And bourgeois jurisdiction will see to it that the concept of "reasonable job" be given the broadest interpretation in the interest of this entrepreneurs' economy, a striking designation for the market economy given once by Otto Wolff von Amerongen himself, the president of the Federal Chamber of Industry and Commerce of the FRG,[13] that they can in fact enforce, for instance, relocation of residence through threatening the withholding of unemployment insurance benefits. This is the soil on which one finds residues of early capitalist or almost feudal labor relations thrive through the borrowing or lending of manpower or the extortion and despoliation by tenants in a personal relationship of dependency.

Concerning the Role of Labor

Social security is indispensably prerequisite to forming and developing the new, typically socialist, impulses of social and, in particular, economic progress. The question as to the impulses of labor in socialism and to the sources from which socialism derives its social energies has been the focal point of the issue between the adherents and enemies of socialism as long as the idea of a socially just social order of human dignity has been in existence. The issue always again concerned itself with the question how people would work under social conditions when not compelled to work either by external coercion or the discipline of the cane or the discipline of hunger. Why should under such conditions people be motivated to work in the first place? What would their motivation be? The arguments by all reactionaries why socialism is impossible and is unable to last have always been, and are, that it would eventually collapse under its own inertia because of the absence of such work impulses as greed for possession, poverty and misery, and direct economic and noneconomic coercion. The classic author among the reactionaries, Thomas Malthus, considered socialism unable "to produce the spur for action which alone could overcome men's natural laziness and stir them up for a proper culture on earth and for producing the comforts needed for their own well-being."[14]

In conformity with reality, however, the adherents to the idea of a necessary social renewal have shown that it is precisely the capitalist order as any other exploiter order before that prevents the abilities and talents of the people from unfolding, that in it the limited goals of production thwart the development of the productive forces and the needs of the people are not satisfied to the extent allowed, on objective grounds, by the given developmental level of the productive forces. From there they derive the conviction--meanwhile confirmed by life in the mightily developing socialist countries--that only socialism will, for the first time, make possible the true unfolding of mass creativity in the most important area of human activity, in the field of labor. In contrast to the exploiter order, utopian socialists in their social designs expressed the yearnings of toiling men not for a liberation

from labor but for the liberation of the workers from exploitation and suppression, for the free development of human essential capacities. Then also, Thomas More's "Utopia" describes a social condition--even though in visionary radiance--where "there is nowhere a possibility for idleness or a pretext for laziness, where no one sits around idly,"[15] "but everyone is diligently engaged in his trade without, however, toiling through uninterrupted labor, like a beast of burden, from early morning to late at night; for that would be more than slavish toil."[16] Charles Fourier, one of the most important utopian socialist, gives a downright emphatic description of men's fervid activity: Men "throw themselves at their work with a zeal that mocks any impediments."[17] Fourier finds the cause for it mainly in that in the new society each can pursue the occupation for which he is most talented and from which he therefore derives the greatest satisfaction.

Marx and Engels were resolutely opposed to regarding work as a necessary evil as well as against the notion work could once become mere game. Bourgeois ideology, to the extent that it deals with labor altogether, sees in the worker always an object, a production factor, a special kind of working tool, but not a creatively engaged subject. This too is an absolutely apt reflection of the manner in which capital deals with labor in practical terms. This kind of negative valuation of labor we can find, for example, in Adam Smith, the most important representative of the classical bourgeois political economy. He thinks work is a sacrifice for the worker, a sacrifice of rest, freedom and happiness, a constant and strenuous overcoming of obstacles. Marx commented on that: "But that this overcoming of obstacles is an exercise of freedom as such--and that, furthermore, the external purposes are divested of the appearance of merely external natural necessity and are posited as purposes, posited by the individual himself--thus become self-realization, objectification of the subject, and that means real freedom, with its action simply being work, is something of which A. Smith has no idea either."[18] Marx and Engels proved that work is the most important sphere of human activity, man's most important vital expression through which he became a man in the first place and through which he effects the upward development of the human species. A true loss of meaning in human work would be tantamount to a degeneration of the human species.

The objective necesssity of socialism was, essentially, explained by Karl Marx and Friedrich Engels by that a society has to be created "in which, on the one hand, no one may shift his own share in productive labor, this natural condition of human existence, onto others, and in which, on the other hand, productive labor, instead of a means for enslavement, becomes a means for the liberation of men in that it offers each individual the opportunity to form and exercise all his abilities, physical as well as mental, in every direction, so that from a burden it becomes a joy."[19]

Labor could of course not play this role in the process of man's social as well as individual life, if it were to become--as Fourier had claimed--

mere sport and amusement. Labor will always remain hardship too. No social condition is conceivable where it could be nothing but joy and pleasure all day long for every individual, as it were. Marx was emphatic about our having to understand work as a necessity, as a basic condition for the existence of human life in all social eras. And with respect to socialism, he said: "Freedom in this field can only lie in that socialized man, the associated producers, regulate rationally this metabolism of theirs with nature and place it under their collective control instead of being governed by it as of a blind power; handling it with the least expenditure of effort and under conditions most dignified and adequate to their human nature. Yet this always remains a realm of necessity."[20] The sense of honestly doing one's duty is, especially in socialism, one of the most important elements of human self-assurance, one of the lofty sentiments only work can bestow as it increasingly challenges the creativity of men in socialist society.

Released Social Energies

The first practical evidence for the production of social energies due to the liberation of the workers class from exploitation, new and totally inconceivable under the conditions of private property, came from the communist subbotniks. The fact that under socialist property conditions man can develop his creative capacities in the most important area of his life's activity, in his work, and that work for the first time can become a matter of honor, of glory, and that production here for the first time is borne by the initiative and the conscious creativity of the immediate producers who also without restraint enjoy its benefits--all this was, is and remains the deepest cause for the historic justification, the need, and the superiority of socialism. "Only now," Lenin wrote, "the possibility is being created at a broad scope, truly for the masses to develop a spirit of enterprise, competition and bold initiative. For the first time after centuries of working for others, of unfree labor for the exploiters, the possibility arises that one work for oneself and do so while relying on all the achievements of modern technology and culture."[21] Only in a socialist country can there be worker personalities who are as well known all over the country as are politicians, artists and scientists.

At the same time, and precisely in connection with his tribute to the world historic importance of the communist subbotniks, Lenin laid great stress on pointing out that the struggle for high labor discipline and for rational labor organization would become harder than the overthrow of the bourgeoisie had been because that would call for the "most persistent, stubborn and strenuous heroism in everyday mass labor."[22] This description has remained correct to this day: on the one hand the massive heroism of labor, in no way conceivable under capitalist conditions, but on the other hand, the heavy struggle for high labor discipline everywhere and all the time and for rational labor organization in line with our social possibilities and requirements.

That the impulses inherent in socialism become increasingly more effective in men's everyday conduct is one of the basic requirements in shaping the developed socialist society. That also means that such rudimentary precepts as a high working culture, the full utilization of working hours, the thrifty handling of material and energy, and the careful maintenance of working tools become second nature.

Of great importance for developing men's creative initiative is a meaningful combination between intellectual and material incentives for work, the rigorous implementation of the performance principle. This principle expresses the measure of social justice attained and attainable in socialism: The social recognition, including the income allocation, goes to all by the same measure--the work performance, and not by where one comes from or what one owns. Implementing the performance principle calls for much consistency of practical management activity. This consistency to a large extent controls the speed of economic progress, and hence of social progress as such. The performance principle, material incentives on the one hand and labor motivation as an idea, on the other, condition and fertilize each other. Experiences have taught us--and the economic advances made especially on the basis of the policy of the eight and ninth party congresses have underscored it--that labor motivation as an idea--the readiness to achieve a lot for society, for "outsiders"--can develop best when one's own experience has shown that good work makes itself paid, that individual, collective and overall social interests coincide in socialism. Wherever much money is made the easy way or where, conversely, considerable and successful personal efforts in education and training, on behalf of fine work results, fail to find material expression, those fundamental connections will not be demonstrated through one's own practical experiences, for which reason political-ideological work also will be less fruitful. Where material and ideational labor motivation work in the same direction, mass initiative will develop best.

The historic experience of the socialist countries confirms that "upheavals in one's personal life situation," unemployment and the upkeep of parasitical classes and strata are by no means necessary as impulses--as bourgeois ideologists would want us to believe. These experiences, however, also tell us that the impulses resulting from social security do not necessarily and by themselves become highly effective but that it requires effective ideological work and high-grade management activity, and that an effective combination between social, collective and individual interests and systematic efforts for enhancing the intellectual-cultural level of the people, their socialist consciousness, are required.

Differentiated Development

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 757-764

[Article by Prof Dr Rudi Weidig, director, Institute for Marxist-Leninist Sociology, Academy of Social Sciences, SED Central Committee: "On the Development of the Socialist Way of Life in the GDR"]

> [Text] The development of the socialist way of life is based on the socialist mode of production and of necessity finds its centerpiece in conscientious, honest and socially useful work. Shaping it means inevitability, achievement and task at once. The growing uniformity in the principles of the socialist way of life in no way amounts to a levelling process in men's life activities but a process that includes the differentiation and variety of interets, needs and inclinations.

One of the central concerns of our humanistic party policy lies in purposefully developing the socialist way of life in all social domains, social classes and strata of our socialist society. In the program issued by the ninth party congress, our party gives itself the task to see to it "that the characteristic mode of social life and individual conduct that conforms to the developed socialist society will increasingly become more prominent in all domains of life--at work and at leisure, in the work collective, the family and all the habits in life."[1] That means inevitability, achievement and task at once. The development of the socialist way of life in terms of its social content means, after all, that the workers class, the class of the cooperative farmers, the intelligentsia and the other working people will structure by what they do their living conditions and modes of conduct in conformity with their common basic interests and the ideas scientifically established in Marxism-Leninism.

Fundamentally new attitudes toward life have already been formed in all social groups of our society with the advance of socialism. They find their clear expression in the working people's massive creative activity

in socialist competition, in the development and further perfection of socialist democracy and the all-round development of people's physical and mental capacities and abilities toward solving the economic, scientific, technical and social tasks in our social development. Such features and characteristics of socialist conduct as a resolute dedication to the safeguarding of peace, our firm friendship with the peoples of the Soviet Union, our active solidarity with the peoples struggling for their national and social liberation, the various initiatives for an accelerated enforcing of rationalization and for decisively improving our labor productivity, the development of social relations among the working people based on comradely cooperation, the extensive development of collectivity, and the fine education and training already are typical of the vast majority of the working people in our country and a clear expression of the humanistic character of the socialist social order in the GDR.

The socialist way of life focuses on the well-being of the people and thus on their conscious commitment and active dedication to improving the life of the individual, the collectives and all of society. It is incompatible with a passive attitude, mere contemplativeness, or idly waiting for further improvements in our lives. A way of life that implies one's own contribution to improving the material and intellectual-cultural life of the people, equality, freedom and social security is deeply rooted in the social interests of the revolutionary workers movement, in the traditions, attitudes and ideals of the revolutionary workers class.

Inevitability, Achievement and Task

The socialist way of life is a way of life of working classes and strata, aimed at the development of the kind of social conditions that make man the measure of all things. It is aimed at the development of his creativity, his intellectual and physical abilities and activities at an increasingly higher level, and it is based on social security, safety, vivid collectivity and the constant improvement in working and living conditions. That this amounts to increasingly more pronounced criteria in the real life of the vast majority of the people in all classes and strata of our society is clearly expressed in our society every day. That is attested by the successful balance-sheet of our economic and social policy, especially since the eighth and ninth party congresses, the upswing in housing construction, the greater net income and annual vacation received by the working people, especially the workers class, and the care for children, working women and the veterans of labor.[2] The direct working and living conditions of millions of working people have been noticeably improved.

The growing development of the socialist way of life is shown by various forms and the high level of social activity. Sociological surveys established that in Dresden Bezirk, for example, 64 percent of the workers, 75 percent of the employees, and 44 percent of the cooperative farmers

do volunteer work in various social functions in their enterprise or residential area whereby they are actively and directly involved in the management and planning of collective and social tasks. Various forms of socialist collectivity and the emergence of appropriate attitudes and modes of conduct are widespread.

Socialism ensures a way of life which, based on a fine education and training for the working people in all classes and strata, challenges and promotes them. More than 77 percent of all the GDR working people has obtained specialized degrees or advanced training. The proportion of semi-skilled and unskilled workers has dropped from 70 percent in 1955 to 22.6 percent in 1978. In the young generation that gets the full benefit of the socialist educational system the social group of semiskilled and unskilled workers will no longer be reproduced. By the end of the century that social group of semiskilled -unskilled—which by and large still typified the training skills and social condition of the workers class in the GDR 30 years ago--will hardly any longer exist.

The socialist way of life and the formation of their essential features in all classes and strata of our society is anything but the illusory dream image the bourgeois ideologists indefatigably insist it is against all evidence of reality. A most real and characteristic feature, a general inevitability of socialism it is. Inevitably the socialist way of life "is grounded in the socialist mode of production."[3] As the foundation for the development of socialist society, the basic premise for the economic and social progress of socialist society, the socialist mode of production can fully effectively come into its own only when the subjects of this mode of production, the working people in all classes and strata, conduct themselves as the socialist proprietors and producers. Thus the socialist mode of production then also is an essential aspect of the socialist way of life which, in turn, is one of the decisive social and ideological impulses for further perfecting the socialist production relations and developing the modern productive forces.

There is nothing rigid about the socialist mode of production. Its formation and development is a contradictory and highly dynamic process shaped by the working people consciously under the leadership of their Marxist-Leninist party. Any given developmental level of the socialist mode of production thus also reflects materialized and objectified attitudes and conduct by the people. That is to say that, as Karl Marx said, the "manner in which people produce their foodstuffs already is a specific type of activity by these individuals, a specific way in which they live their lives, a specific mode of living."[4]

Part of the formation and development of the socialist way of life finally also is that the current and future requirements for the development of the socialist mode of production always give rise to new demands for social life and individual conduct. This process has by no means been terminated and is not yet complete--however much has already been achieved that is great and the real substance of the socialist way of life in our time

already constitutes a great accomplishment of socialism. The general formation of the socialist way of life in all classes and strata in our society as well as in the personal lives of all working people is a task that has to be solved together with the further shaping of the developed socialist society at a constantly higher level. That includes "preserving and protecting and, at once, further developing and perfecting what has been achieved through struggle."[5] A simple and smooth path it is not, simply because the socialist way of shaping life includes steadily elevating the socialist consciousness of the masses, their education, their technical skills, their general culture as well as overcoming obsolete habits, traditions and customs.

The socialist way of life, safeguarding what exists and progressively shaping living conditions at work and leisure, must above all be placed on a stable economic basis. The much more complicated reproduction conditions of recent years call for great efforts by socialist society and all its citizens for ensuring and systematically further developing the high level attained in living conditions. Once again, at the 12th Central Committee plenum, Comrade Erich Honecker said the most important thing was "significantly to improve our country's economic efficiency."[6] It means that the struggle for developing the modern productive forces and their efficient use, and the acceleration of scientific-technical progress, is the decisive link in the chain for increasing the rate of economic growth above and beyond normal measures.

From there new criteria also arise for the political, economic and scientific-technical creativity of the workers, employees, intellectuals and the other working people. Conscientious, honest, socially useful work, the centerpiece of the socialist way of life, becomes increasingly the crucial testing ground and essential condition for all sociopolitical progress. More than ever the most important point is to provide an atmosphere everywhere in which initiative, creative contest, a sense of responsibility, love for work and revolutionary deeds for strengthening socialism as well as our readiness for the protection and defense of our achievements can fully develop. Because without honest and diligent work, without conscious and systematically organized mass action, mobilized by our Marxist-Leninist party, without the dedicated commitment of millions to their own interests, without each individual taking an energetic stand for the good of all members of our truly humane society, we will not be able to find those answers, solutions and alternatives which are urgently needed for coping with the considerably higher requirements of the 1980's.

Sociological investigations and labor surveys demonstrate in this context that the greater potentials extant in education and training, in creative activity and initiative as well as in the socialist attitude toward work can mainly be developed extensively in places where in a good work atmosphere creative participation flourishes, socialist rationalization goes together with concern with working conditions, with the targeted reduction or elimination of heavy physical, hazardous or mentally

undemanding work, where work is well organized, the workers are informed at the proper time and thoroughly, and their counsel is listened to, where stable collective relations are developed and material and moral recognition is paid in accordance with actual personal and collective services performed for society. Violations of these proven socialist management principles, in turn, often cause dissatisfaction, deficient labor discipline, inadequate performance and fluctuations.

A key function here lies in setting up appropriate working conditions and assigning work that is mentally demanding. Various sociological surveys have shown that the readiness of the working people to take an active part in enforcing scientific-technical progress is all the more developed the more they are aware that this produces high performance improvements, and the more directly they sense the concern for good working conditions that is connected with the introduction of new technology and techniques, especially a reduction of heavy and hazardous work, work that is mentally more demanding, more varied and more interesting, while the high level of knowledge and skill which most working people have reached conforms with their actual job requirements and can be put into effect in the work they do.

Unity and Differentiation in the Development of the Socialist Way of Life

It is therefore part of further improving the efficiency of the party's political leadership activity always to keep accurately in mind the general and the special conditions, the uniform and differentiating features in the development of the socialist way of life. As a historically novel qualitative element of the socialist way of life a special point is usually made of the formation of common traits in all classes and strata and social groups in our society. And indeed, the basic trend of the socialist way of life, which also more and more prevails in the SED's purposeful alliance policy throughout the practical life of our society, lies in the development of basic identities in the essential conditions of life and modes of conduct. This, objectively, stems from the fact that we are here concerned with the development of the conditions of life and modes of conduct of comradely associated working classes and strata which by their activity produce the material and intellectual wealth of all society themselves. The uniformity in the basic traits of the socialist way of life reflects the uniformity of the basic social relationship between the working people in all classes and strata and the socialist ownership in the means of production and the socialist workers and farmers state, the uniformity of the basic social interests, the social goals and the growing political-moral unity of the classes and strata in our society.

Such a way of life is unprecedented in all of history. In the exploiter society the fundamental conditions of life, the goals in life and the modes of conduct of the various classes are socially distinct and marked by class antagonism.

It therefore is an important historic achievement, one of the greatest social accomplishments of socialism in fact, that it not only did away with the exploiter classes and their parasitical way of life that was predicated on the exploitation of the working people, but also, through the new power and property relations, created those decisive conditions that make it possible for the working classes and strata to fashion their own way of life in accordance with their own basic social interests and on the basis of their own work performance. Thus, under the leadership of the working class and its revolutionary party, essential uniform traits of the socialist way of life are forming in all social classes and strata. They are various in kind. They express themselves, for instance, in the comprehensive development of socialist patriotism and proletarian internationalism as much as in their collectivity and comradely cooperation, in their social activities and their sense of social responsibility, which gives rise to appropriate modes of conduct, in their socialist attitude toward work, public property and scientific-technical progress, and in their active dedication to the consolidation of socialist state power and of peace. Such achievements of socialism as the right to work, social security, equality and safety are characteristic of all classes and strata in our society. Extensive democratic participation in the management and planning of social affairs and access to education, training and the treasures of culture and art shape their life. Such and other similar common properties are of crucial importance for the development of concerted social activities by the working people in all classes and strata in the continued shaping of the developed socialist society.

The ever increasing common traits in the basic features of socialist life activity are supplemented by a variety of manifestations of diversified differences. Diversified processes in the development of the socialist way of life are found in the uneven levels in which characteristics that in principle are uniform have been molded and also in that there exist different criteria in the concrete conditions of life among the various social groups and individuals. With respect to which, the following general remark is called for:

The growing homogeneity in the basic features of the socialist way of life in no way means uniformity or the levelling of living conditions or interests, abilities and talents of men. If bourgeois ideologists keep trumpeting around in the world that socialism, in theory and practice, negates individuality and independence altogether, and the wealth of men's social activity in life, their anticommunist disparagement of real socialism is all too apparent. Life itself gives the lie to them. And it is this life that confirms that not until socialism those material and ideational premises have been created that allow the working people to develop and bestir themselves as personalities interested in many different things, cultivate individual capabilities, talents and inclinations, and thus invest their lives with content and culture. Increasing collectivity and growing individuality and variety in the personal lifestyle are not opposed but harmoniously complementary in socialism. Thus

the increasing diversity and variety of the socialist personalities' interests, needs, relations and activities at work and at leisure are essential factors enriching their common properties without the constant encouragement of which socialist collectivity is impossible. This must be stressed for the mere fact that the all-round development and use of the abilities and talents of personality, the respect for and encouragement of man's individuality, and the variety of needs and the diversification of education are indispensable prerequisites for the development of creativity and for the further enrichment of personal and public life, and are a condition for the growing wealth of social relations and the increasing attraction of socialist common traits. These differentiations that conform to the socialist way of life are a progressive factor with respect to the initiative and public activity of men in our society and are being encouraged.

Altogether, the development of the socialist way of life is a contradictory process of constant confrontation, where new things grow and old ones have to be done away with. In making new modes of conduct, relations and activities at work and at leisure and in the family grow extensively on behalf of public and personal progress, we must however also resolutely turn back and overcome any conduct that is alien to the essence of socialism--like irresponsibility, passivity, insouciance, or the attempt to live at the expense of others and similar traits. Our party never harbored the illusion that a process as revolutionary and penetrating as the comprehensive enforcement of the socialist way of life in all domains and the life of every man could be brought to realization within a brief period and without conflict. The way of life conforming to the old society took centuries and many generations to evolve and has deeply affected, and deformed, a large part of the working people, and has molded many of their habits, views and attitudes that, objectively, oppose the interests of the workers class. Furthermore, the enemy, via his mass media and through many other channels, does everything he can to export his ideology and the forms of his way of life to the socialist countries and to preserve and nourish modes of thought that are alien to socialist attitude. All this has brough it about that petty bourgeois modes of thinking and conduct have not yet been done away with everywhere, that some citizens are still trying, for instance, egoistically to violate the principle of distribution according to performance, to exploit insufficient controls for enriching themselves personally without doing any work, or to "make money" out of defects in labor organization. That then is why the development of the socialist way of life calls for effective ideological work and the rigorous application of socialist legality and discipline, so as to turn down the old and more and more help the new to prevail.

The socialist society has a social structure that is new in kind. Class antagonism, which for millenia dominated the relations among the various groups of people, has been abolished, but not all class and other social differences have by that token been overcome as yet. Those social differentiations as they exist between the workers class and the class of the

cooperative farmers, between those two classes and the social stratum of the intelligentsia and the other working people and between those who primarily work physically and primarily work mentally, and between the urban and the rural population, are reflected in the differentiated development of the socialist way of life. It means the socialist way of life has an internal social structure. It is fashioned primarily by the workers class, the main political and social force, but it develops as a mode of life of socially differentiated groups of working people and, within the scope of increasingly common features, also is marked by any particular conditions of work and life, traditions and functions in socialist society. There are for instance particulars and differentiated conditions in the development of the socialist way of life as between life in the city and in the countryside, in the large city, the small town or the village, in industrial sprawls or in agricultural areas with a smaller population density. These differentiations range all the way to the specific conditions for satisfying needs and for leisure-time conduct and family life.

As far as differences go in the sharing of the socialist way of life brought about by the level currently attained for the social productive forces, they can of course not be resolved immediately and all at once. Scientific-technical progress and, on its basis, socialist intensification are the crucial link for systematically forming those material conditions more and more comprehensively, which will facilitate the gradual reduction and elimination of these social differentiations.

To create the high level of the social productive forces required for it, it is necessary extensively to develop in all classes and strata in our society our social activity, creativity, and a performance willingness and attitude as the essential substance of the socialist way of life. For this it is necessary to use still more effectively the general features of the socialist way of life, fashioned especially by the workers class and its world-outlook, as well as the specific conditions, facilities and functions of the various social classes, strata and social groups, on behalf of social progress. That also implies our fully developing the potentials of public property and of cooperative property in agriculture and the specific conditions of the highly skilled intellectual-creative activity of the intelligentsia and the special skills of the craftsmen and tradesmen, for higher performances for the benefit of socialist society and of every individual. In this way any given particular conditions in the social situation and development and the social differences, or differentiations, in living conditions and in attitudes can be used as a productive factor, and the special contribution of the social classes and strata to scientific-technical progress and the further development of the socialist way of life can be boosted.

ADVANCES IN PUBLIC HEALTH SYSTEM REVIEWED

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 742-748

[Article by Dr Werner Hering, member, SED Central Committee; chief, Health Department, SED CC: "Our Socialist Health System--Achievements and Demands"]

> [Text] The eighth and ninth congress decisions form the foundation for the performance trends and chief developmental directions of the GDR health system. They are an element of the SED social policy. A program for the development of medical care is consistently being brought to realization through stages. What demands are made for further improving the quality and effectiveness of medical work on management and planning and on the training of associates in public health, on medical research and political-ideological work?

The GDR health system went through a particularly successful stage of development in the 1970's. Through the eighth party congress resolutions, the joint resolution by the Politburo, the Council of Ministers and the FDGB Federal Executive Board of 1973 on further measures for implementing the socialist program in the field of public health, and the ninth party congress resolutions, the main trends were set down for setting up, step by step, a public health system appropriate to the developed socialist society. We have made good headway with it. Patients have justified confidence in the technical skill of the physicians and nurses. Most citizens regard the society-sponsored extensive protection of their health as an essential achievement of our socialist order.

Through the eighth and ninth party congress resolutions it was possible to provide a better quality of health care development in many respects. At present, approximately 460,000 officials take care of the health and social welfare of the GDR citizens. The number of physicians has risen by almost 6,000 since 1970 to 33,000. That makes the GDR stand out in

international comparisons. Since 1971, as many as 8,000 new medical and dental positions have been created, more than 100,000 nursery spots, and approximately 30,000 spots in leisure-time and health care centers. As many as 280,000 children up to the age of three are lovingly taken care of today in day nurseries, and more than 110,000 senior citizens spend their old age, socially secure and safe, in leisure-time and health care centers. New hospitals have been taken into operation in Riesa, Schwedt, Weisswasser, Halle-Kroellwitz, Neubrandenburg and Suhl. In some older facilities we succeeded in significantly improving the care and nursing conditions for the patients, completing the medical-technical equipment, and further easing the working and living conditions for the physicians and nurses.

As to the substantive development of the health system, the eighth and ninth party congress resolutions focus on giving, on a priority basis, all citizens better access to the medical services required for satisfying men's most important and most frequent needs for medical care. Mainly, the citizens are meant to take advantage, without any difficulties, of the services of out-patient and stationary basic care, which amount to roughly 90 percent of all transactions between the citizens and the health system. Thus our health policy is responsive to the general concern of our party's social policy to tackle, and gradually solve, the everyday issues which the vast majority of the workers class and the working people feel are especially urgent.[1] To solve this strategic health policy task, a graduated program for improving medical care was initiated.

On the Development of Ou-patient Facilities

The first stage in this program provided for developing out-patient service into an efficient area of public health and for ensuring high-grade service especially for care in general medicine and pediatrics. Today, 18,000 physicians work in out-patient facilities--a good 5,000 more than in 1970 and, on the whole, more than half of all physicians. With 560 polyclinics, 980 out-patient facilities, 1,650 state-sponsored medical practices, and 2,250 physicians and dentists licensed to work on their own, the GDR has a relatively fine network of out-patient health facilities. While in 1970, an average citizen would resort to out-patient medical or dental help seven times, today he does so 11 times annually. That amounts to 180 million transactions with the socialist health system annually in out-patient treatment alone. In turning out-patient treatment into an efficient functional area, an important health policy objective was achieved. As a result, in many places reservation and waiting periods could be reduced, and it has become easier for a citizen today to find a doctor in whom he has confidence.

Good dental care is an important issue. Since 1978 there has been a more noticeable effect of the measures initiated directly after the eighth party congress for improving the training capacities for stomatoly students, and also of the help provided by the Soviet Union and other

fraternal countries in dental training. For the first time since late in 1977, the number of dentists rose by 800. This development is going to continue more vigorously in years ahead, so that we will be able to do away with the often still too long waiting periods for dental treatment and repair.

With all this we do not ignore that there are still unresolved problems and difficulties. We still have not enough specialists in general medicine and pediatrics. Medical occupations in some large cities and industrial areas, for instance in such important working class centers as Halle, Merseburg, Bitterfeld, Karl-Marx-Stadt and Senftenberg, call for special attention. Especially there, where great economic achievements are performed, the highest level of medical care must be guaranteed. For that we need a full cooperation from the graduates of medical studies. The medical and dental positions required have to be created, and the public state organs have to make housing available. After the 11th Central Committee plenum the party organs once more dealt with these matters thoroughly and, together with the public health ministry, set down measures to achieve, in preparation of the 10th party congress, further noticeable improvements for the citizen and provide permanent solutions. That calls for still more extensive support by bezirk and kreis headquarters, more purposeful political-ideological work, and more rigid management by the competent state organs.

We must also do away with any routine treatments and lack of attention to patients so that we will be able to speak of a socialist doctor-patient relationship everywhere. To that end, a good amount of ideological work has still to be done in quite a number of places.

When new large residential areas were being built, we did not always manage to build polyclinics and out-patient clinics simultaneously. But it is part of a functional residential area "that the citizens' medical care also is assured."[2] Individual medical out-patient facilities set up in apartments are no substitute for polyclinics and out-patient clinics. Nor is that economically justifiable.

Development of First Aid

This form of rapid professional medical care in cases of accidents, life-endangering conditions and serious acute illnesses is currently in effect in 63 kreises--all big cities included--for a total of 7.5 million citizens. Whereas in 1970, circa 50,000 persons seriously ill or hurt in accidents were helped this way, in 1979 more than 160,000 received such often life-saving aid. Through the development of emergency and intensive care units in hospitals a closed rescue chain evolves ranging from the place where the emergency occurred all the way to highly specialized in-house care. Not last, we thereby reduced the number of those who die in accidents each year by more than 1,000. In the years ahead this important form of medical aid is to be made available to all citizens.

Improved Efficiency for Our Hospitals

Due to the successful development of out-patient treatment, the ninth party congress was able to focus on developing in-house and out-patient care together and pay more attention to hospitals in this connection. This introduced a second phase in implementing the graduated program.

Up to 1975, out-patient service had been developed partly at the expense of hospital development. Today it has become possible to carry on the development of these two great areas of medical care at a much more balanced ratio. That also is urgently necessary because the enormous increase in knowledge on the part of medical science through the last 20 years takes effect first and foremost in the hospitals. Possibilities in surgery and in successfully performing ever more complicated surgery even on babies and older people have broadened significantly. While up to a few years ago in cases of accidents and bone fractures the bed and the cast amounted to the most important therapy, today more than 20,000 expensive operations based on new technology are performed each year providing the patients with a more rapid and funcionally better healing process, even though the techniques and the nursing care are more expensive. In 1979, there were 60,000 patients more than in 1970 who received highly skilled medical care in the special departments of intensive therapy, orthopedics and urology alone. Whereas in 1970, for instance, 750 pacemakers were implanted, in 1979, the number had already risen to 5,100--and 85 percent of them came out of our own production. Due to that, the GDR now occupies one of the leading positions in Europe. Complicated heart surgery with the heart-lung machine increased from 200 to 800 cases annually. Since last year the GDR has been among the countries where even the most complicated operations can be performed in this field. Artificial kidney operations went up from 10,000 in 1970 to 86,000 in 1979. More than 4,000 prostheses were implanted in 1979.

The broad introduction of new and, at the same time, most of the time extremely labor-intensive diagnostic and therapeutic methods, and the greater possibilities for taking care of acutely ill and older patients have significantly increased the physical and psychological stress on physicians and nurses in the hospital. These qualitatively novel demands that are going hand in hand with an enormous increase in operational efforts cannot be coped with, despite considerably more intensive work, by physicians and nurses remaining unchanged in number. For that reason, especially since 1976 great efforts have been made to improve the medical personnel in specialized surgical departments and recruit more nurses for in-hospital care. The addition of physicians in the hospitals has been noticeable. It however still does not ensure enough medical personnel everywhere. In the 1980's also circa half of the new doctors will be employed in the hospitals. Altogether the point is, through improved political-ideological work by the party and FDJ organizations, mainly on the college level, to bring it about that the young medical intelligentsia becomes willing, without reservation, to work wherever it is most necessary for our society.

To insure high-level nursing care, it is extremely important to get more nurses. That applies mainly to the big cities, including the capital Berlin. Considering how indispensable it is for uninterrupted medical care that by far the largest proportion of medium-level medical personnel do shift work --75 percent right now is working on shifts, 50 percent in the three-shift system--, it becomes clear what complicated tasks the health system faces here. Constant care for favorable working and living conditions, creating a good work climate and deepening socialist attitudes and convictions in professional ethics belong among the priority tasks of the political-ideological work of the party and trade union organizations and the state managers in hospitals and clinics.

Further improving our hospitals' efficiency requires systematically carrying on the program issued by the ninth party congress on the reconstruction and new construction of efficient health facilities by means of a high economic performance improvement and the energy of the working people even under the changed economic conditions of the 1980's. Besides the Charite, the largest investment project of the health system in the history of the GDR, 12 other hospitals are under construction. When they are completed, approximately 150,000 patients can be treated more expertly each year, over 60,000 more operations can be performed, and we will get circa 3 million more X-rays and 14 million additional laboratory analyses.

The burdens placed on the GDR economy in the 1980's make it necessary to elaborate a still stricter rank and sequence for the use of financial and material funds in the investments for solving the most urgent health policy objectives, in that funds are used as efficiently, effectively for the public and economically as possible. Along with completing the hospitals under construction, systematic investment and maintenance funds are mainly to be used for the maintenance and reconstruction of existing hospitals and foster-homes.

Medical Care in the Enterprise

The industrial health system reflects most emphatically the social character of our health protection system. A considerable performance level has been reached in this area. There are, after all, more than 3,000 physicians and dentists who are responsible for the health of the workers and other working people in the enterprises directly. Two thirds of all people employed--5.5 million working people--get extensive medical and labor-medical care through the industrial health system. In recent years, therefore, the emphasis was placed on extending industrial health care not just quantitatively, but qualitatively as well. This orientation is meant to improve further the medical care for the production workers in the large-scale enterprises. At the same time the eighth and ninth party congresses have ordered strengthening the influence of medicine on making working and living conditions healthier. That some production workers are still working under conditions harmful to health is a fact. And also the mechanization and chemical processes of agriculture entail new requirements in labor medicine.

Making working and living conditions healthier is of course not exclusively the responsibility of medicine. It also has to do with a targeted influence to be brought to bear on the matter of reporting sick, which causes considerable losses in social labor capacity. The health system, no doubt, plays a special role in this; the judgment on being able to work calls for high diagnostic and therapeutical skills. Every physician has to be aware that he, by being authorized to make out sick leave slips and prescriptions, has a key to the people's treasury in his pocket. What is most important in reducing sick-leave status is and remains that all those that are responsible here, the enterprise managements, the foremen and brigade chiefs, the trade union organizations and the health system, assume their responsibilities and closely cooperate at once and that the political-ideological clarification process is purposefully being advanced regarding these matters by the party and trade union collectives. If there is a constant draft in some part of the plant, no manager should be surprised many people report sick. Flue shots do not help then. Not even after the efforts on behalf of developing an effective vaccine against flue virus by Dresden's Saxon Serum Plant have been successful.

Extensive Mother and Child Care

From the outset, the socialist society has given special attention to the health protection of mother and child. That, not last, follows from the great objective of our society to insure a healthy development for every young person and make possible a harmonious development of his physical and mental capacities. The special health protection for women on a job or during their pregnancy, delivery or childbed period helps create the kind of conditions for women to be able actually to assume increasingly more their equal position in practical life. Our performance level in pregnancy, maternity and child care is something we can be proud of. With an infant mortality rate of 13.1 per 1,000 live births and a maternal mortality rate of 1.6 per 10,000 births, our republic occupies a noteworthy rank internationally.

The gratifying birth increase of recent years makes higher demands on our health system. That pertains to our having to expand our capacities in midwifery and the modernization or reconstruction of pregnancy and maternity counseling centers. There is a consistent effort at further raising the number of beds for deliveries, so that all mothers giving birth can stay at least 7 days in a clinic. In the years ahead, more expert pregnancy and maternity counseling and a pediatric care for the newborn in line with modern developments must of course constantly be given our special attention.

Although during the current five-year plan and through additional initiatives by the kreises, more than 50,000 day nursery spots are being newly created--Potsdam Bezirk has set an example here--, the number of infants to be cared for is rising faster at present than the new extra nursery spots. In international comparisons, we come out with the

highest rate of infant care, in placing circa 600 of the 1,000 infants entitled to it in day nurseries, infants, that is, up to the age of three. In spite of that, many thousand applications for day nursery spots can at this time not yet be passed. It shows how urgent it is systematically to expand further the network of day nurseries and to make optimum use of them.

Also in the development of placing physically or psychologically retarded in day nurseries and homes our society has evidently made fast progress in recent years.

Increasing Importance for Medical Training and Research

While in the last 35 years an efficient health system has been generated in our republic, still more training and medical research will determine the further improvement of the quality and effectiveness of medical work in the future. That places a high demand on the knowledge and skill, and thus on the training and advanced training, of the scientists and physicians. The full use of all intellectual and material potentials increasingly more becomes the crucial factor for performance improvements in medical work on the whole in the further shaping of the developed socialist society. In conformity with the demands of the 11th and 12th Central Committee plena, these factors will become more and more important in the 1980's. Even while on the threshold into the 1980's, the Politburo took a position on basic natural science and technical research and medical research and adopted basic resolutions on the development of the university system.[3]

In recent years, the medical scientists in our republic accomplished internationally recognized research achievements at a high theoretical level and of great practical use to health protection. That included procedures for extending blood bank storage periods and producing substitute skin tissue for covering large wounds, immunological diagnostic methods and an automated microscopic image analysis for cancer probes, the investigation of cellular mechanism in memory formation, the development of modern dialysis processes, and the first successful liver and island cell transplants and other matters. These outstanding achievements demonstrate it is necessary and possible to develop medical research in conformity with our social prerequisites as well as with regard to our country's medical traditions.

In confrontation with imperialism, it is a challenge of great political importance for all medical scientists in our country further to advance the fine international reputation of our health system in the 1980's through top performances in the science, in the prevention, diagnosis and treatment of illnesses and in their etiology and generation. The tasks passed on in the Politburo resolution on matters of medical research concentrate on areas that would make us expect pioneering results for medical research and achievements of international rank, with a growth of insights that is of great social interest. It is understood that

that in medical research too, the GDR relies on close cooperation with the Soviet Union and the other fraternal countries. For moving in those directions we need a fresh spirit in research, the right cadres, a bold promotion of the rising generation, and implacable comparisons with world standards, and that presupposes a militant atmosphere in all party organizations and medical science institutions.

Determining the endogenous (internal) causes of cardiac infarcation, high blood pressure, cancer, flue, psychological and other illnesses is the focal point in medical research today. Access to that is most readily found by combining medical research with basic biological research and through the cooperation between clinical and theoretical-experimental collectives of scientists. Medical research ought to pay greater attention to the increasing frequency of chronic diseases. Also in medicine it is necessary to examine, without reservation, the originality of a science requirement for each project, so that we will not merely "run after" any international trends. Stricter criteria obviously have to be applied to the defense of research projects and research results. The recently formed medical science council is especially responsible for that.

High medical research requirements make high demands on industry but also have, more than ever, direct effects on intelligence-intensive production. That calls for still closer connections between medical research and the industrial branches and research centers that are important to medicine, particularly those in electrical engineering and electronics, machine building, chemistry, optics, the light industry and the microbiological and pharmaceutical industries, so that top-achievements are obtained in research and production. The automated measuring microscope Parmaquant, which is of crucial importance to cancer diagnostics, was developed through the cooperation between medical scientists in Rostock and Carl Zeiss Jena combine collectives and is an outstanding example for how rapidly and successfully a completely new idea can be brought to realization through a concentrated use of cadres and means and in close cooperation with industry while rigorously utilizing the advantages of our own social order. Such developments can also be beneficial for industry and export.

Creativity and Great Dedication by the Physicians and Nurses

The physicians, dentists, nurses and other associates in public health are able and willing to dedicate all their strength to solving the demanding tasks which, in conformity with party resolutions, confront our health system. That is confirmed by the numerous initiatives and fine results of socialist competition.

Every citizen appreciates a sound, reliable and helpful medical consultation or dental treatment. Many factors, no doubt, affect the quality and effectiveness of medical care. Decisive is the knowledge and skill, the

professional ethics and the dedication of the physicians and dentists, the nurses and all other associates in public health. It will depend on the maturity of a medical personality, his education and political attitude, his strength of radiation as a human being, his cultural level and the example he sets as a citizen, what effects he will have on his patients and in the residential area, and how much confidence a patient and citizen will place in him. That makes our party's steady political-ideological work with the medical intelligentsia all the more responsible a task. It vitally helps inspiring every physician and nurse for providing the highest grade of medical work and for gaining as much knowledge as possible, to be able to give the citizens access to the achievements of modern medicine and helps making the physicians and nurses feel an all-inclusive sense of responsibility to the development of our socialist public health system, in that a comradely productive cooperation between work collectives and institutions develops ever more strongly--or, in short, that all associates in the socialist health system help implement creatively and with a high sense of dedication our party and state policy, especially in their own professional field. There must nowhere be a sterile atmosphere in public health except in the operating room! Medical activity has never been unideological or apolitical in history; but not until socialism do the humanistic concerns of medicine and professional medical ethics fully coincide with the society's interests and the policy of the state.

SUCCESSFUL DEVELOPMENT OF SOCIALIST DEMOCRACY REVIEWED

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 765-770

[Article by Prof Dr Gerhard Schulze, jurist, first dean (prorektor), GDR Academy of Political Science and Jurisprudence: "On the Humanistic Essence of Socialist Democracy." A translation of an earlier EINHEIT article on the same subject by Prof Otto Reinhold, containing further references to related information, is published under the heading, "Socialist Versus Bourgeois Democracy Analyzed," in JPRS 73253, 18 Apr 79, No 1670 of this series, pp 24-33]

[Text] Led by the workers class and its Marxist-Leninist party, the working people in our republic direct and plan the affairs of state in the freedom of their own self-determination. The article demonstrates that the deeply humanistic essence of socialist democracy expresses itself in various ways and that democratic codetermination effectively fosters personality development. The proven forms of democratic participation must be further molded and perfected, and all citizens must actively be drawn into the solution of the social tasks.

Socialist democracy with its deeply humanistic essence is one of the most important achievements in the construction of the new, socialist society led by the workers class and its Marxist-Leninist party. All experiences of the victorious workers class in the socialist countries confirm the Leninist doctrine that "vital creative socialism is the work of the popular masses themselves."[1]

In free self-determination and equality the working people in our country consciously shape their public life on the basis of the objective inevitabilities of social development. The socialist social order causes and promotes the free development of the working people's essential capacities in the process of work and their public activities--which expresses

the humanistic essence of socialist democracy. Not until socialism were the conditions created for actually allowing the working people, led by the workers class and its Marxist-Leninist party, to manage and plan their affairs of state through their own free decision-making. Socialism provided the workers class and its alliance partners with true sovereign self-determination both for the people and the individual. The workers class in power made possible the development of real, socialist democracy, the comradely and creative cooperation of all working classes and strata for shaping the new society that is adequate to man and insures that the people owns what the people's hands create.

Our experiences with the successful course behind us in the development and consolidation of the socialist state demonstrate to us that it is not from one day to the next but throughout a permanent process of democratic participation that the working people acquire the abilites to structure public relations in conformity with objective requirements on behalf and for the benefit of the people. Precisely through the process of democratic participation in the management and planning of society the working people have been and are being enabled to meet the constantly new and complicated developmental requirements. Vital socialist democracy--as demonstrated daily by our political practice--decisively affects the personality development of the individual, the molding and continued shaping of his modes of thought and conduct. Democratic participation elevates and reinforces political awareness, fosters the shaping of a firm class standpoint, and deepens the knowledge of the inevitabilities of our era and of the course, directed by the party, toward further social progress. That also expresses socialist democracy as real humanism.

Inseparable from that is the fact that the humanistic essence of socialist democracy, its superiority over any other form of bourgeois democracy, results from that the socialist state does not only proclaim the citizens' freedoms and rights but socialist society provides its citizens with real possibilities and conditions for making actual use of these rights and freedoms.

We rightly speak of the humanistic essence of socialist democracy also because the citizens' democratic participation in all fundamental decisions--like the laws, law regulations and resolutions--enables them in the first place consciously to fashion and control their process of public life. Our country's working people themselves are the ones who, for instance, have coauthored our party program and their state laws in the truest sense of the word. Only recall, for example, the breadth and intensity of the popular debate on the party program draft for the Ninth SED Congress, which charted the course and objective of our social development over an extended time period. The Central Committee received a total of 1,168,000 letters, position papers and recommendations from citizens, work collectives, SED members and candidates, party collectives and members of other parties. It is the custom in our socialist society to submit for public debate the drafts of basic laws to the population

before they are ratified by the People's Chamber. Millions of working people have taken part in the popular debates on such draft laws--which was made a principle of the Constitution in its article 65 section 3--and thereby helped improve their quality. The humanistic essence of our socialist democracy is thus attested to not only by the content of our laws but likewise by the following facts: some 750,000 citizens debated the draft of the family code and submitted 23,737 suggestions; in 60,000 meetings, 1,500,000 citizens took part in the discussion of the law on the local people's representations, submitting 4,300 amendment proposals for that draft law; and 5,400,000 citizens discussed the draft for the youth law and made 4,821 proposals on amending that draft law; equally pronounced was the democratic participation by all segments of the population in the discussion of other fundamental draft laws, as the civil code and labor law.

Such facts also show how our socialist society implements this deeply humanistic principle: all political power is exercised by the working people and serves their well-being, the safeguarding of peace, and the protection of human dignity. Firm foundations have been laid for this decisive constitutional principle: the humanistic essence of socialist democracy is predicated on the political rule by the workers class and its being led by the Marxist-Leninist party, on the public ownership in the means of production and thus surmounting the exploitation of man by man and abolishing class antagonism. Only by having all working classes and strata rally around it in alliance, the workers class, led by its vanguard, was able to lead the socialist revolution to victory, consolidate the socialist workers and farmers state as a form of the dictatorship of the proletariat, which represents the interests of the entire GDR people, and make its political power prevail on a broad democratic base through which it invests our socialist order with its humane traits and combative qualities.

All our experiences confirm this: the working people's determined leadership by the workers class and its Marxist-Leninist party not only proves the decisive condition for the transition to our new, humane order of socialism. It also is the indispensable prerequisite for the further shaping of the developed socialist society and thus for creating the fundamental preconditions for the gradual transition to communism.

Spread and Perfection of Socialist Democracy

Coping with the demanding tasks facing our country in the 1980's, in the further shaping of our developed socialist society, means still more effectively bringing to bear on it all the advantages and impulses of socialism. That applies particularly to further perfecting our socialist democracy. After all, the years behind us in our development have provided us with the persuasive evidence that the people's sovereign self-determination has become a powerful impulse for our successful advances. For that important social progress that was achieved through the implementation of the eighth and ninth party congress resolutions was due to the

strong public activities of the workers class and all working people. Their sense of responsibility, expert involvement, experiences and creative, dedicated efforts were decisive in having our socialist society, as Comrade Erich Honecker stressed at the 12th Central Committee plenum, "attain a considerable degree of maturity, internal stability and, at once, effectiveness in external respects."[2]

To continue resolutely the party policy which serves the good of the people, to insure, and step by step further extend, the material and intellectual-cultural standard of living achieved, under the changed external, principally the foreign economy, conditions far more complicated problems have to be solved than in the 1970's. To meet them adequately and accelerate scientific-technical progress, whereby we can cope with a decisive improvement of our economic efficiency, is a challenge to the deliberate and systematically organized cooperation among all working people--to the effectiveness of socialist democracy. Strengthening the socialist state and further perfecting socialist democracy are matters that condition each other. The socialist state, after all, is the chief instrument the working people, led by the workers class, have in shaping the new society, and "the further spread and perfecting of socialist democracy," as the party program puts it, "is the main direction in which socialist state power develops."[3]

Life has produced many different forms, well tested in practice, for the citizens' democratic participation in public affairs. More effective use of them still has to be made so that the citizens can take part still more extensively in making expert decisions on the concrete issues of economic, social and intellectual-cultural life in the enterprises and cooperatives, the towns and communities, the councils and commissions of the people's representations and various other social organizations. Our experiences have taught us, after all, that the working people are all the sooner ready to participate democratically with all their strength, responsibly and with rich initiatives, the more strongly they sense that their participation is needed, their counsel, their recommendations and their critical suggestions as well, and their committed dedication to implementing them becomes a benefit for society and the individual. That is conspicuously attested to by the results of our competition, "More Beautiful Towns and Communities--Join In!" Millions of citizens are engaged here in manifold creative activities which help fulfill the economic plan, mobilize and expand the activities in the citizens' cooperative efforts for all classes, strata and age-groups, and shape the environment in accordance with their interests. For many citizens the participation in this National Front competition--which turned into a genuine people's initiative--was the first step toward deliberately participating in public life. These and all other proven forms of democratic involvement must be fully used toward actively including, more and more, all citizens in finding solutions for the tasks in all domains of public life.

In this connection also it is of great importance that the matters in which the citizens address themselves at their state organs are processed attentively and unbureaucratically. While our state power is consolidated and our socialist democracy is made more perfect, "the greatest value should be placed on involving the citizens, on attentively dealing with their suggestions and critical advice," Comrade Erich Honecker has demanded. "Everyone should sense we highly appreciate his responsible participation in solving our common public tasks and take seriously any matter in which he addresses himself with trust at the organs of state."[4]

The People's Representations--Foundation of Our State Power

The democratically elected people's representations and the work they do for the good of the citizens are a visible reflection of the high level of implementation of our socialist democracy. In contrast to the bourgeois system of representation, the people's representations in our socialist state reflect the social structure of socialist society. In them are drawn together the best forces of the workers class and of the other working people allied with it. The outcome of democratic elections, they enjoy the people's trust and are accountable to the citizens.

In our socialist society, the people's representations are the most comprehensive power organs of the state in which and through which the workers class and the other working people allied with it exercise their political power. From the People's Chamber to the bezirk and kreis assemblies, the city-kreis assemblies and city-district assemblies, all the way down to the community representations, they form the basis of the uniform system of state power in the GDR and are, at once, the most complete embodiment of its democratic character. The people's representations manifest the will of the working people. Their more than 200,000 members are a great political force. On 20 May 1979, people's representations were elected in the kreises, towns and communities "which are not only greater in number, but also of a new quality in their composition."[5] They have a greater proportion of workers of material production, many youths and women among them. The deputies are distinguished by their fine education, sound political and technical knowledge, great expertise and rich life experience.

In years past, the activity of the people's representations has visibly gained in quality. They deal with all fundamental problems in their territories, increasingly better learn to combine properly the territorial needs with overall social requirements, resolutely concentrate on the problems in the implementation of their territorial plans, and are developing direct permanent contacts with the industrial work collectives and the cooperatives and with the citizens in the residential areas. In spite of that it is necessary to tap still many other reserves in order to make still more effective the deputies' work, especially of those who are engaged in material production. That includes having the

councils create all prerequisites and working conditions that will make it easier for the deputies to exercise their volunteer activities for the good of their voters and in the overall state interest. It is also shown that the active stand taken by the people's representatives in their enterprises and the respect for and support of their activity by the work collectives and enterprise managements are increasingly turning into an essential factor of successful deputy activity.

Along with the deputies there are tens of thousands of citizens in the GDR who engage in various forms of volunteer work in the state apparatus. In more than 30 fields of activity in the state apparatus, in the central and local organs, volunteer collectives are working in the form of commissions, committees, councils and activists groups. Volunteer associates, helpers and delegates are engaged in 20 other fields of activity. This active participation by citizens virtually extends to all domains in state management and planning and is brought to bear on every phase in the state management process.

Millions of working people are taking part in government! Their work crucially helps fashion the humanistic essence of socialist democracy: Our republic has 204,910 citizens who are deputies of the People's Chamber and the local people's representations; circa 500,000 citizens are working on the standing commissions and activists groups of the people's representations; 335,000 citizens are working on the 17,000 National Front commissions; 95,550 working people are members of the 9,762 centralized continual production consultations of their enterprises; 300,000 citizens are on the retail trade organization and restaurant advisory councils and on the sales outlet commissions; 358,000 workers, master workmen, engineers and scientists are working in work and research communities; 225,623 working people are in conflicts commissions; 50,173 citizens are involved in jurisdiction; 53,448 citizens are members of our arbitration commissions; 223,929 working people assist in the Workers and Farmers' Inspectorate and are working in circa 6,500 inspectorate commissions; and 680,765 citizens, in 5,894 parents' advisory councils and in 104,465 groups of teachers' aides, aid in the education and training of our young people at our schools.

These impressive facts per se demonstrate the humanistic essence of our socialist democracy, even if they do not by themselves reflect the substance and effectiveness of the work or the degree of maturity in democratic participation. Nor are they in any way complete. Millions of citizens also affect the fashioning of public life through their functions in trade unions, in social welfare and public health, in the domains of culture and sports, in insuring order and security and many other places. Thousands of citizens are committed to other bodies and social organizations. The involvement of the vast majority of the working people in state and economic management and their confident cooperation regardless of world-outlook, religion or party membership--this proves to be one of the decisive advantages of socialist democracy, an important pledge to that the people own what the people's hands create. Socialist democracy--that is truly government by the people, exercised by the people and its elected organs.

Socialist Democracy and Personality Development

To exercise political power and consciously shape all domains of public life--the way our socialist society practically engages in politics--directly affects the personality development of those who are democratically engaged like that. Taking part in expert decision-making after all, calls for great political knowledge, solid technical skills, and high personal commitment--regardless of which level or which organization. In the process of democratic engagement all this is fostered to a decisive degree, the individual gains new knowledge and deepens his insights into overall social interconnections and inevitabilities, broadens his understanding of the party's overall strategy and tactics, and enhances his personal conviction of the correctness of our course. This revolutionary practice forms personality to a high extent, furthers independent, initiative-rich activities, and further develops the awareness that the responsibility one bears is for the whole.

Especially this democratic participation often presents an individual with an entirely new testing ground and expects prudent decisions from him in thus far unfamiliar areas (only consider the many teachers' aides and parents' advisory council members elected for such functions for the first time, who might even be assuming such an executive function for the first time, or consider the arbitration commissions, the traffic safety activists groups, advisory councils of various kinds, where citizens frequently take their first steps in democratic participation in elected functions).

No statistics are likely to account for how democratic participation develops the talents, inclinations, interests and abilities of an individual. Great importance for personality development does however attach to democratic participation. It enriches the individual's store of experiences, improves his judgment, develops his sense of responsibility and also crucially affects his conduct at work and at leisure. Democratic participation also enriches the individual's public relations, his relations with society. Often it is only through this activity that an individual, in pursuit of common tasks, makes close contact with citizens differing in skills, world-outlook, religion and party membership. And how many may there be who in an election function for the first time pose tasks the fulfillment of which they have to control, and who for the first time have to prepare an accounting or an exchange of experiences by themselves.

Democratic participation is neither a formality nor an end in itself. Responsible and conscientious work it is, aimed at bringing the advantages and impulses of socialism still more comprehensively to bear, at creating all conditions under which public relations and the abilities and talents of people can fully develop, so they may invest their lives with substance and culture.

'DIALECTIC' OF SOCIAL, PERSONAL FREEDOM IN SOCIALISM EXPLAINED

West German Commentary

Bonn IWE-TAGESDIENST in German No 101, 7 Jul 80 p 1

[Report from Berlin: "SED Rejects Criticism of Individual Freedom in Socialism." A translation of the East Berlin EINHEIT article cited below follows this commentary]

[Text] The theoretical SED journal EINHEIT (No 7/8, 1980) has rejected Western criticism of restricted individual freedom in socialism. Such attacks bore "features of the historical defensive" and aimed at placing in doubt "the new quality of social and individual freedom in socialism." The "social freedom" gained by socialism was "prerequisite, basis and thus the historic framework, as it were, for the development of individual freedom." The possibilities for further shaping individual freedom in socialism depended on the degree attained in the collective control by the working people over their natural and social life processes. Consequently, individual freedom in socialism was "nothing definitive, nothing attained for once and for all." It was always in a state of change and developed with the growth of the productive forces and with the perfection of the people's production relations and intellectual culture. From that one should have to proceed in wishing to "judge today's developmental status and the current developmental requirements for social and personal freedom correctly." Through the shaping of the developed socialist society, the conditions would expand for the free development of individuality.

Marxist Philosopher's Discussion

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 771-779

[Article by Prof Dr Herbert Steininger, program director, Marxist-Leninist Philosophy Department, Humboldt University, East Berlin: "Freedom and Individuality." Translations of articles on related topics as indicated are published in the following JPRS issues of this series: on

the importance of 'subjective rights,' personal freedom--74723, 6 Dec 79, No 1744, pp 28-48; concept, theory of human rights, personal freedom--70919, 7 Apr 78, No 1520, pp 29-47; 70196, 21 Nov 77, No 1476, pp 34-45; 70001, 19 Oct 77, No 1463, pp 72-80 (followed by interview on problems of personal freedom, pp 81-85); and 69532, 1 Aug 77, No 1426, pp 36-56; on human rights, class rights--70702, 28 Feb 78, No 1507, pp 73-79 and 68187, 9 Nov 76, No 1317, pp 17-27; and on development of personal freedom--69293, 22 Jun 77, No 1404, pp 105-118 and 68228, 17 Nov 76, No 1320, pp 19-33]

[Text] Freedom is man's control over nature, society and himself--a process combining natural law, the laws of social development, scientific understanding and conscious action. Explaining this, while taking issue with the bourgeois ideology of freedom, the article explores the new quality of social and individual freedom in socialism and the dialectical interactions between social and individual development.

The great and historically motivating idea of human freedom imbues our party's program tasks and the struggle for their implementation. That idea, going far back in human history and pervading history as soon as it becomes the history of class struggle, has received scientific form in the world-outlook of the workers class. The founding fathers of Marxism-Leninism, in their materialist-dialectical concept of society and man, established the realization that the development of individual freedom is a decisive element of social freedom in socialism, and that here the conditions, prerequisites and impulses for the unrestrained development of the individual are formed and come into their own.

A natural concomitant of the matter is that especially with regard to this point socialist and bourgeois ideology collide with each other most vehemently and the conflict over theoretical, ideological and political issues connecting with it is visibly intensifying. Since socialism assumed its real shape in the Soviet Union and the countries of the socialist community, bourgeois ideology, after all, no longer has had to deal merely with the Marxist-Leninist theory of man and his freedom, but also with their real existence, their struggle in our era and their present-day activities. The real existence and historic work of men in socialist society clearly and convincingly reveal the main goal of socialist social development--to raise, on the basis of a high speed in socialist production development, the people's material and cultural standard of living, whereby to create increasingly better conditions for developing the individuality of each, his creativity, initiative, knowledge and skills.

Historically on the Defensive

Bourgeois ideological attacks on real socialism, especially on its historically new, enormous potentials for the development of individual freedom, bear the features of the historic defensive into which imperialism has long been forced. They are aimed at placing in doubt the new quality of social and individual freedom in socialism as much as its decisive foundation and conditions--the political power of the workers class in alliance with the other working people and the public ownership in the means of production. The idea and reality of individual freedom in socialism are equally intolerable to the bourgeois ideology. They irrevocably refute the basic concept in the bourgeois ideology on freedom, inseparably connected with the bourgeois idea of society and of man, grounding individual freedom in the private ownership in the means of production. Be they program documents or social conceptions of rightist-conservative or social-reformist forces, or conceptions based on existentialist, positivistic or religious views--the conceptions of freedom proclaimed in them are always determined by the idea that the one-sided and limited freedom of capitalist commodity production ultimately determines the freedom of the human individual. What is revealed there is the class character of all bourgeois theory on freedom.

In the FRG, for example, the CDU's basic program, passed at the 26th party conference in Ludwigshafen, declares the so-called social market economy a social premise anchored in the "idea of responsible freedom as part of the Christian image of man" (figure 65 of the program).[1] The CSU program in the FRG likewise proceeds from that idea. It declares a policy that would preserve and consolidate the so-called social market economy to insure "that an individual can exploit the new and great possibilities for freedom and development resulting from the change of society and the changes in social structures."[2]

The orientation framework '85, adopted at the SPD Congress in Mannheim in 1975, does say: "Freedom is however social reality, and not merely an illusion and privilege for a few, only when all men have the actual (economic, political, social, cultural) possibility for free development." But with it, the private economic disposition over the means of production and market competition, i.e. the capitalist economy, are declared indispensable. They are merely thought to be in need of supplementary government management measures.[3]

Bourgeois theories on freedom, generated in the struggle by the rising bourgeoisie against feudalism, today are in many regards reactionary, whatever they may look like. First, they are aimed at concealing the nature of imperialism i.e. as much as possible hide the fact that the economic and political power of the monopolies, "which are everywhere pressing for domination and not for freedom," as Lenin put it, is "reaction all the way through."[4] Second, bourgeois freedom theories play an important role in the intellectual manipulation of the working people in

the capitalist countries. They aim at obliterating the ever more glaring contradiction between the proclaimed bourgeois-democratic rights and freedoms and social reality by maintaining and solidifying the illusion of the "free" and "mature" citizen, to tie the working people down to state monopoly capitalism.[5] Third finally, this way they are trying to deplete the problems of genuine human emancipation in our era of their vital social substance.

All possibilities of philosophic idealism are mobilized to this end. Freedom is conceived as an absolute "value" valid forever, is detached from its social frame of reference and presented as an anthropological problem that relates mainly to individual human beings only. That precisely is the case when CDU representatives in the FRG announce, for instance, that freedom is "personally accountable freedom, individual accountability and coresponsibility in society," while it is emphasized at once that "the freedom of man is based on a reality that transcends the human world."[6] The logic in this conception lies in shifting the foundations of human freedom to the irrational, extraterrestrial domain, by which the question about the social foundations of freedom and the real possibilities any concrete society offers to individual freedom becomes pointless. Then freedom--turned thereby into a personal matter, a matter of "man created for freedom"--can consequently also be left to the sole responsibility of the individual "who must account for his freedom."[7] The clear-text on this reads as follows, however: When man is unfree it is not because he lives under social conditions that prevent man from controlling the circumstances of his material and intellectual life but only because he does not meet his accountability to freedom, does not live up to it--so that it is up to the individual whether he is free or not. It is obvious who benefits from this conception of freedom, inasmuch as it comes down to it that freedom, in "transcending the human world," can then not be the outcome of revolutionary struggle, for which reason such struggle becomes actually meaningless.

In contrast to bourgeois conceptions of freedom, the Marxist-Leninist definition of freedom proceeds from the thought that human action has its basis in the objective inevitabilities in the development of nature and society, and it connects this materialistic point of departure with the recognition of conscious activity by socialized man. That is an acknowledgment of human dignity and of the value of true individuality at once. For the core of this conception is the most vital question of what it means to be truly human--the question of man's relation with his natural and social environment, the question of the practical control man has over nature, society and himself. The Marxist-Leninist answer conceives of freedom as a process that combines natural law, the laws of social development, scientific understanding and conscious action. This unity--and only this unity--gives society and the individuals the real possibility for being able to control the objective conditions of the real life process and to have individuality come into its own. In this sense also it was that Marx and Engels opposed the idealistic conception that man

was free "through the negative capacity to avoid one thing or another." Rather, he is free "through his positive capacity of bringing his true individuality to bear."[8]

Free through the positive capacity of bringing true individuality to bear--that is, first and foremost, a social problem. The essential circumstances and conditions that determine the formation of those human characteristics which, as individual modes of thinking and conduct, as the wealth of his intellectual life, as the development of his talents and abilities, and as the development and application of his creative forces, constitute his individuality are to be found mainly in the material process of public life, that is, in any given mode of production and the social, political, ideological and cultural social relations conditioned by it. Through the process of material life, in the production and reproduction of public life based on the given production relations and of course also in the practical and intellectual activities in political, scientific and cultural life, the individual develops, forms the features and traits of his individuality, shapes his personality.

As long as social conditions exist that are based on the private ownership in the means of production, it is not the individuality of working man that is wanted, but only one aspect of this individuality--the useful labor capacity in it. That leads to the consequence that individuality is suppressed a million times, the gifts and talents of millions and millions of people remain undeveloped, the trend toward impoverishing and stunting individuality prevails over all public life, and enormous efforts are required to at least partly counteract that trend in the workers class and among other working classes and strata.

How topical these problems are particularly at present is shown by the situation in capitalism. In connection with the deepening crisis in that society, the unfavorable developmental conditions for individuality are only being further exacerbated in the capitalist industrial countries through their massive unemployment. The official unemployment figures in those countries have risen from 8 to 17 million since 1970.

Of special significance to the developmental constraints on individuality are the problems brought about by scientific-technical progress under capitalist conditions. The modern achievements of science and technology show up there as "job killers," as hostile to whole occupational groups whose special knowledge and skills are invalidated, but hostile also to those who remain in the production process and whose exploitation is being intensified while their efficiency and health are ruined more rapidly. The catastrophic character of the social consequences of scientific-technical progress under capitalist conditions is seen wherever it is a matter of the essential prerequisites for the development of the individual, for the forming of individuality--also in the fields of training and general education. When millions of young people find there is no place for them in that society, that they are not needed and they cannot, however hard they try, make their lives meaningful, it has deep and permanent negative effects on the development of individuality.

It is no coincidence therefore that bourgeois ideologists play down the importance of these aspects of the material life process for the development and molding of individuality but declare the formal bourgeois freedom rights the ne plus ultra of human individuality development. The formal bourgeois freedom rights which in the light of the bourgeois ideologists show up as the end-all of all freedom of personality do have their importance no doubt for the members of the workers class and for other working people. They can be used in the struggle for social progress and socialism for organizing the workers class and in developing the anti-monopolist struggle for insuring and expanding the working people's democratic rights.

But however important bourgeois freedom rights are for individual existence and for the struggle by progressive forces in that society, however necessary it is to defend them against any attempt at constricting them further by the monopoly bourgeoisie--the margin they leave for the actual control of man over nature, the social processes and himself, and thus over the massive development of individuality, is extremely narrow. The exploitation relations of capitalist society and freedom "are mutually exclusive. Freedom for the working people arises only with the end of exploitation, with socialism."[9]

Accretion of Freedom in Society--A Gain of Individual Life

The freedom of the individual in socialism is a historic achievment. Its objective prerequisites lie in the political power of the workers class and its allies, in the public ownership in the means of production, the planned management of the social developmental processes and in the growing control over nature by means of a rapid development of the productive forces. It insures the freedom from exploitation--the key problem that has to be solved if one is to talk seriously of individual freedom, and not in the euphemistic sense in which bourgeois ideology talks about reality. It insures the freedom from the insecurity about subsistence resulting for millions from the capitalist mode of production. It insures a material standard of living that rises with the development of the productive forces and the productivity of social labor. It guarantees comprehensive education for all working people that includes the scientific world-outlook and the acquisition of technical knowledge and skills in conformity with personal inclinations and within the scope of public requirements. And it guarantees, if one summarizes it all, the individuals' participation, based on active, creative and expert decisions, in the solution of social tasks. It is particularly this participation by the individual in the rule exercised by the associated producers, invested by expertise and borne in responsibility, which makes possible for and demands of the individual the development of his individuality all-around.

But that is tantamount to always making more strongly prevail whatever makes human existence more worthwhile and enriches it: working creatively, testing, and productively and constructively applying, one's capacities and capabilities, enjoying the accomplishments of human culture,

contributing to its preservation and augmentation, finding satisfaction in one's own work and in working together with others, and living a life that is meaningful, rich and fulfilled. The revolutionary workers movement has always been struggling for a society that enables each member freely to develop and engage his personal capacities. That is why in the SED Program the all-round development of the capabilities and talents of personality for the good of the individual and of all socialist society is called one of the noblest goals of the revolutionary workers movement.

The Marxist-Leninist theory of individual freedom and real socialism in practice refute the bourgeois notion that the problem of individuality is under all social conditions the problem of the individual who has to prevail against society in creating for himself, in view of the enslaving, anonymous forces of society, a domain of private interests and inclinations, a "freedom sphere" that is screened off from the concerns of society at large. This bourgeois conception reflects the intensifying antagonism between individual and society which has its roots in the private ownership in the means of production, the isolation of individuals and their opposition in the struggle of all against all. That idea of human individuality and of the freedom of the individual is as poor in substance as the concept of man on which it is based. It cannot answer the question what the real requirements for individuality development truly are because it starts from the proposition that the antagonism between the individual and society is inherent in human existence per se and cannot be broken. The definition of individual freedom, after all, is purely negative, entirely the position that was criticized by Marx and Engels, as freedom from something. While that indeed is one aspect of freedom, but when applied to the whole, its proper character gets debased. Freedom must at the same time also be defined as freedom for something.[10] Only that reveals the social leeway, the possibilities for actions, the space for movement and development in the activities in the subject of freedom, expressed in the freedom to act and be active in conformity with the development of society and of the individual.

The freedom to act expresses itself in socialist society in the conscious participation by millions of citizens in the democratic exercise of power, in the purposeful struggle for plan fulfillment, which makes high demands on the individual and the collectives alike, and in the competition and innovator movement. It expresses itself in the manifold relations of comradely cooperation and mutual aid, developed in the work and study collectives, the residential areas, the leisure-time and recreational facilities and so forth. It comes out in study, in the deliberate appropriation of education and culture, in the dedication to the protection of the socialist achievements and of our socialist fatherland against any imperialist attack and, not last, in our proletarian internationalism in action, our active solidarity with all peoples in the world fighting for their social and national liberation.

To become active in this sense is of course in the interest of socialist society. It benefits from it and carries it ahead, for which reason it also provides appropriate social recognition and appreciation for it. It would be one-sided, naturally, to look at the freedom of action only under this aspect. Our classic authors already pointed out that, in socialist society, the social activity of the individual in interaction with the conditions of public life is the foundation and decisive element in the development of essential human capacities and that social activity is the main road to forming personality and developing talents and capabilities, not only in one's work but equally so in other fields, such as the field of culture and art, for developing the ability to enjoy oneself in many respects and so forth. "Nothing develops personality as much as an active stand in life, a conscious attitude toward one's social obligation, when the unity of words and deeds becomes the everyday norm of conduct,"[11] Comrade Brezhnev remarked at the 25th CPSU Congress.

Such an active attitude in life, the social commitment, has become the crucial factor of personality development in socialist society because, as Karl Marx predicted in the "Theories on Surplus Value," the antagonism between society and individual has here been broken and the "development of the capabilities of the human species coincides with the development of each individual."[12] That is why socialism, for the first time in history, creates the social prerequisites for enabling everyone to develop his individuality. This is evidenced, for example, by our socialist educational system which, in conformity with its humanistic objective, makes sure that everyone can get a fine general education, and the individual can get training in his diversified talents and develop his abilities. That starts early in kindergarten and continues in school and other educational institutions. Or think of the potentials in the arts as they develop, for instance, through the regularly held workers' festivals and other forms of personal cultural activities, or of athletic talent, purposefully trained through the Young People's Spartacus Sports Festival. And still many other things might be mentioned in this context.

When bourgeois ideologists accuse socialism of contempt for individual concerns and of subordinating the individual to society and thereby depriving him of his freedom, his developmental possibilities, they engage in one of the most malicious anticommunist distortions of reality. Such slander usually comes combined with recommendations to modify socialism through the blessings of bourgeois democracy and freedom in such a way that it assumes a "human face." Among the historic achievements of socialism is that it has replaced the formal bourgeois freedoms and rights by real freedoms and rights and constantly develops and perfects them further. How else could it assume truly human form? Perhaps by the inhuman, destructive freedom of exploitation of man by man? By the dubious freedom to disseminate unscientific, reactionary anti-human ideologies in the name of freedom? Or by the freedom of the individual

that is often proclaimed in bourgeois constitutions and commemorative orations though, admittedly, it does actually not exist, unless he belongs to the ruling class in that society, to infuse his own opinion and his interests into the molding of public intent and the processes of economic and social decision-making?

Our criteria for the freedom of the individual and of society are not those of historically obsolete stages of development. Bourgeois individualism is just as little a criterion for how individuality makes itself prevail in socialist society. Those criteria stem from the nature of socialist society itself, from its inherent basic inevitabilities. Human freedom and individual development irrevocably belong to the essence of this society, are deeply anchored in the structure of its economy, its sociopolitical life, its culture. The fundamental requirement of this society to develop in every way all productive forces, above all economic growth and the productivity and efficiency of social labor, in order to develop the people's material and cultural standard of living, is no general requirement in the interest of some anonymous society apart from the interests of the individual. On the contrary, it expresses the vital interests of the individuals--the workers, cooperative farmers, members of the intelligentsia and all members of society.

The individuals' vital interest, first and foremost, lies in the safeguarding of peace, material security, the free development of his talents and abilities, and a cultured life. This interest, for all intents and purposes, coincides with the interests of socialist society in the development of the productive forces, the consolidation and perfection of the production relations, the development of cultural life, and creating and insuring favorable external conditions for the development of socialist society. Whatever aspect of the work of socialist society one may look at, its ultimate and supreme goal always is man, the development and happiness of the individual, which however cannot be attained outside, or even in opposition to, socialist society. The complicated economic, social, political and cultural problems that have to be coped with in realizing the meaning of socialism can doubtless only be solved on a social scale. Yet no social end in itself attaches to the solutions we seek, find and implement. The total interest of society is expressed in them, which not only recognizes individual interests but helps them come into play.

With regard to the problems of freedom this means that in socialist society individual freedom is exhausted neither in social freedom nor in the freedom of the collective. Individual freedom is not simply a consequence of social freedom, does not automatically evolve from it. Social freedom is the premise on which individual freedom can develop. Social freedom makes possible for the individual freedom of thought, of decision-making, of taking action and developing his talents and abilities. But these possibilities will assume the reality of individual freedom only to the

degree an individual takes advantage of them for his personality development and takes part, in accordance with his individual capacity and by investing his knowledge and skills and creative capabilities, in solving the tasks of the collectives and of the entire society. In practically taking possession of social freedom, in developing his initiative through his own free decision, and acting, in conformity with social requirements, according to his personal interests, an individual can develop his individuality and truly bring it into play.

Thereby the development of human individuality, of the creative capacities of the individual, at the same time becomes a condition for the further advance of society, individual freedom causing and advancing the development of social freedom. It was this aspect of the interrelation between individual and society, between individual and social freedom, Marx and Engels had in mind when they wrote in the "Communist Manifesto" that with the communist form of society replacing the old bourgeois society with its classes and class antagonisms, there would come "an association wherein the free development of each is the condition for the free development of all."[13]

The social freedom gained by socialism is prerequisite, basis and thus the historic framework, as it were, for the development of individual freedom. The development of individual freedom thereby then also becomes an essential criterion for the degree of maturity in social freedom and its steady further development for the good of all. Therein lies the dialectic of social and individual freedom in socialism, the characteristic process of its development. The possibilities for the further shaping of individual freedom in socialism depend on the degree reached in the collective control of the working people over their natural and social life processes. The growth of this control, in turn, depends on the conscious acts taken by the many individuals and on the individual potentials and abilities they invest in them.

Initiative--Real Possibility, Requirement and Obligation

The socialist revolution is a leap by mankind from the realm of necessity into the realm of freedom also because with it, for the first time in history, a society made its appearance that makes possible and, without reservation, asks for the free initiative of each individual in all domains of public life. If in this society the individual applies his individuality the socialist way and develops in his activity his initiative as a component of the collective planned shaping and further development of the social conditions of life, then it becomes a mighty impulse toward social progress and augments the freedom of society. With it, the individual grows, his personality gains something, his character forms and becomes firmer. The society's gain in freedom thus amounts to a vital gain for the individual that expands the range of his development and so becomes a gain in individuality. It was precisely this question Lenin had in mind when he wrote, in his essay, "How to Organize the Competition," that only through the construction of socialist society

the possibility would be created "for the broad masses, truly for the masses, to develop their spirit of enterprise, competition and bold initiative."[14]

Naturally, even in socialist society individual freedom is nothing definitive, nothing attained for once and for all and thus a definite quantity. It is always in a state of change and develops with the growth of the productive forces and with the perfection of the people's production relations and intellectual culture. From that one must proceed in wishing to judge today's developmental status and the current developmental requirements for social and personal freedom correctly. Through the shaping of the developed socialist society, we expand the conditions for personality formation, for a massive free development of individuality. That is an objective requirement of the social process rooted in the modern productive forces and their speedy further development as well as in the socialist power and property relations. The dynamics of our social development, for all intents and purposes, results from the creative initiative of the many individuals within the conscious, purposeful, planned activities of socialist society, activities based on the insights of our scientific world-outlook and the authoritative decisions by our Marxist-Leninist party.

These are extremely important interconnections for the strategy on economic development. At the 12th SED Central Committee plenum, Comrade Erich Honecker made a point of the working people's great dedication to their work who "unite their activities in order to apply the advantages of socialism more and more in the GDR--in the interest of our society and for their own benefit."[15] This readiness to perform will bear all the more fruit, the better the working people are informed about the situation and solutions are discussed and decided on with them.

All this places high demands on our political-ideological work. We must take into account here that the majority of our population has already grown up under socialism, acquired extensive education in our republic and learned to think and judge politically and share the responsibility for society at large. All the more does the further development of free initiative call for penetrating and comprehensive insights into the inevitabilities of social development, the economic interconnections, and the objective requirements for political action--that is, expert knowledge prerequisite to free and responsible action on a higher qualitative level than perhaps a decade or two decades ago.

What our classic authors predicted about the interrelations between social and individual matters, between social and individual freedom in socialism, today, for all intents and purposes, controls the real process of life of our society and of the individuals belonging to it. It is our task to make ever better use of this wellspring of interrelations that socialism alone could tap and put into effect, on behalf of the life and happiness of each individual.

SOCIAL SCIENCE TEACHERS TO STRESS DIALECTICS, CLASS MORALITY

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 798-805

[Article by Prof Dr Gerhart Neuner, member, SED Central Committee; president, GDR Academy of Pedagogical Sciences; member, GDR Academy of Sciences: "Educating Active Fighters for Our Revolutionary Cause"]

[Text] Proceeding from the requirements and conditions of the 1980's, suggestions are made for more deeply thinking about education issues. Understanding the ideological-intellectual and social-psychological peculiarities of today's youth and a constructive, confident relationship with them is a decisive condition for success in our education. It is important convincingly to convey the theory and methods of our world-outlook to young people, instill a combative attitude in them and immunize them against imperialist diversion. Communist morality and moral education in the Leninist sense have to pervade all regular school activities.

In preparation for the 10th SED Congress, in educational matters also a creative discussion is under way in which we are assessing what has been achieved, proceeding from the ninth party congress resolutions and the guidelines of the eighth educational congress. Insights and experiences at hand have to be worked on, and we have to examine how to carry on our deliberations with an eye to the requirements and conditions of the 1980's.

Awareness, Dedication and Responsibility

Today's political struggles, the guidelines of the most recent Central Committee plena, and the speech to the kreis first secretaries by SED Central Committee General Secretary Comrade Erich Honecker have given many impulses to thinking more deeply about ideological work and educatior

matters. The 1980's make the highest demands on political awareness and orientation capability, steadfastness, willingness for performance and efficiency, the joy in dedication and a moral conduct in any field whatever--in strengthening our economic efficiency, coping with scientific-technical progress, improving the defense capacity of socialism and developing socialist democracy and the socialist way of life. It is the announced policy of our party deliberately to foster, further train and actively use these subjective factors in progress. That is of considerable consequence to the political-ideological work among youth, the development and use of our educational potential, and the communist education of the up-and-coming generation.

The young people who are going to assume responsibility in the years ahead were formed by socialism with its achievements and advantages. They are standing up well in the class conflicts of our days. Highly educated, taught allegiance to their socialist fatherland, firmly connected with the Soviet Union and the other countries in the socialist community, and with all progressive forces in the world, and ready for active solidarity, they are eager for responsibility and possibilities for proving themselves--and we are in no way oblivious to that with some youths there are some problems. We find the willingness and ability for high-level performance, open-mindedness to science and culture, responsiveness to scientific-technical problems, and interest in ideological, intellectual-cultural, ethical and esthetic issues. These young people avail themselves of the achievements of real socialism as a matter of course, at times it seems almost too much so. We would however be misled in our educational work without always considering the ideological-intellectual, social-psychological peculiarities and performance potential of today's youth.

A constructive, confident relationship with youth is and remains a crucial condition for successful ideological and educational work. Our party, the top representatives of which were outstanding youth functionaries, also has important theoretical knowledge and practical experiences in this regard. Understanding for youth does not mean, as was stated at the GDR's eighth educational congress, "to release youth from their responsibility; quite on the contrary, it must be demanded of them. But first young people have to learn how to bear responsibility for themselves and for others. This is why we must let them take part in the solution of problems and the implementation of tasks, why we must acquaint ourselves with their interests and carefully guide them, listen to their opinion, respect it, and take it seriously if they themselves do."[1] Such an attitude toward youth implies understanding and confidence as much as demands, consistency, open-mindedness, humor and refraining from petty regimentation. Such matters of principle with respect to the proper relationship with and attitude toward youth ought to play an important role in each party organization, especially in the schools and educational institutions.

Our imperialist enemy opposes the humanistic ideas and values of socialism with a whole arsenal of the most reactionary past and current ideologies, anticommunism and anti-Sovietism, geopolitical and colonialist conceptions, and pessimism about the future and dread. A flood of the most vicious slander and distortions is being poured on the people. Modern mass media and sophisticated mass manipulation procedures are targeted and employed. Youth in our republic--as much as other working people--see themselves directly confronted with that in various ways. Our enemy has not abandoned the hope to make GDR youth waver in its stable political stance and firm allegiance to the socialist fatherland. Educational FRG Land ministers passed a resolution, "The German Question in Instruction," on 23 November 1978 which aims not only at poisoning FRG youth in the nationalistic-revanchist sense. Its declared objective also is to reach the youth in our republic with the counterrevolutionary thesis "that their homeland is actually called Germany and not GDR."[2] Any kind of historic distortion must serve that end--Prussian history, fascism, the anti-fascist resistance struggle, or the last 35 years. Perhaps one can still succeed--so they figure--in chilling the youth in our republic, at least ideologically. Delusion thus is their copy editor when bourgeois ideologists eagerly are propagating withdrawal into the private sphere, the idea of recalcitrance.

Political Decision on Scientific Ground

It is an important achievement that our youth systematically absorbs the scientific ideology of the workers class through scientific method from early on in the educational facilities, the Ernst Thaelmann pioneer organization and the FDJ, and in extracurricular activities. That conforms to their need to gain a proper orientation in the world and to take sides deliberately. The teachers, especially in the social science subjects, work as propagandists in the truest sense of the word, making young people acquainted with the Marxist-Leninist world-outlook and our party policy day in and day out. Social science instruction is intent on scientific quality, on making the pupils aware and convinced of the inseparable connection between theory and practice, and theory and party policy, on combining the teaching of fundamental theoretical knowledge with topical events.[3] Experience has taught us that theory becomes all the more an effective means for understanding policy and an aid in personal decisions and a weapon in the struggle, the more thoroughly and expertly it is imparted. Without solid knowledge and skill there is no political application and no educational effect in what was learned!

At times young people in the social sciences may be able to talk about one thing or another, but their knowledge is not solid, nor are they sufficiently able to apply it and correctly evaluate political events. Teaching plans and instruction materials in the social sciences focus on conveying basic facts, interconnections and inevitabilities. They aim at laying a foundation for the basic convictions in our world-outlook.

In elaborating them, we paid attention to determining more clearly the points of concentration and the nodal points in the material, the points of major emphasis to be treated. That succeeded especially well in the more recent teaching schedules and study materials for history grades 10 and 11 and civics grade 11, for example. The proclivity toward completeness often still impedes solid teaching and skill development, however. A more accurate definition of the foundations to be laid remains a task for further cooperative efforts among teachers, method designers and social scientists in the various disciplines.

For some social and political contexts it also holds true that thought must be given to how they are to be treated on the level of the most up-to-date data and facts, for instance the development of the world revolutionary process, problems in the coping with the scientific-technical revolution, the place value of science and technology, the ways and means for introducing economic contexts, a well balanced and accentuated presentation of our national history, and the dialectics between nature and society, for instance in connection with energy, raw material and environmental problems, the socialist performance principle, and the questions about the meaning of life and about what is desirable and valuable. It is and remains a peculiarity of social science instruction that, due to social development, and to new insights and topical experience gained by youth, certain teaching materials, and teaching schedules as well, must more rapidly be brought up-to-date.

Especially important and complicated is the matter of grade levels in social science education. A young person must deal with the same basic political-ideological questions on different age levels, always of course in relation to topical tasks, knowledge and experience. Social science education therefore has to be structured in such a way that certain basic political-ideological questions are picked up again and deepened on different grade levels and that the knowledge of the Marxist-Leninist principles concentrically expands. Unless grade level matters are properly coped with, young people will feel that concentric expansion and deepening is merely a repetition of what they already know. And then there are some subjects which even because of their teaching schedules and study materials lead to unjustified repetitions and duplication, for instance, about the character of our era, socialist economic integration, the historic leadership role of the workers class, or the essence and tasks of socialist state power. This calls for better correlation between instruction, basic study and propaganda activities.

The principles of the Marxist-Leninist world-outlook are imparted in various social and natural science courses. In preparing the teaching schedules and study materials now in effect, and on their basis, a lot of good has been done to make young people aware, through a specific subject of instruction, right through that subject, of ideological insights and political and moral contexts. We paid attention here to V. I. Lenin's reminder of principle that instead of overusing the term

Marxism, we should impart insights and modes of thinking in workers class theory and policy by the whole manner of presenting subject contexts.[4] Frantic political-ideological references or topicalizations remain ineffective or might even have negative effects. Always should we be mindful, even when managers make demands on the teacher, that there is no way at all to detach ideological cogency and persuasiveness in instruction from its technical-scientific and didactic-methodological quality. Ideological contexts and political and moral conclusions strong in the power to convince presuppose a deep understanding of scientific facts and inevitable connections. They become especially prominent in instruction where it is a matter of applying science data to problems of politics and life. Pupils are extraordinarily receptive to energy and raw material issues, environmental problems, matters of the application of nuclear energy, microelectronics, the materials economy, energy conservation, genetics and breeding. They comprehend quite well that the ways and means by which such problems are tackled and solved bear a close connection with our social order, world-outlook, and moral values and norms. The latest facts, information and interconnections is what the teachers need in this regard. Outstanding scientific specialists should take a part in providing them with them.

For enabling pupils to think dialectically, school instruction has great opportunities. Teaching schedules and study materials are based on the premise that skill in dialectic thinking cannot be reduced to conveying a limited number of thought principles and rules. As a thinking method, dialectics is to be demonstrated, developed and practiced within subject contexts, substantively and concretely, in application to questions of life. For some courses it has been worked out in greater detail how in the acquisition and application of subject knowledge elementary skills in dialectic-materialist thinking can be developed. Great efforts are being made to familiarize the pupils with the dialectics of the class struggle, the long-range prospects of the socialist revolution in the GDR, and the dialectic developmental processes in nature. But frequently there is still some trouble in convincing young people with regard to contradictory developmental processes in connection with advances and temporary reversals in the class struggle, with problems and contradictions in coping with our scientific-technical progress, in the development of new perspectives on and attitudes toward labor and in shaping a new way of life and so forth. Undialectic presentations with hyperbole are not credible and can produce illusions or even doubt. It is an important task for philosphers and educators to process available insights and experiences and show more concretely how young people can be enabled step by step to think dialectically.

Conveying our world-outlook demands problem-related instruction, active issue-taking, and independent thought. Especially under the current conditions of the class struggle, we must make more, in instruction and teaching, of the active, combative potentials in our world-outlook. We have to attack imperialist policy and ideology aggressively from our

own positions. Experienced teachers and propagandists will equip young people with facts, proofs and arguments that enable them to perceive the superiority of the Marxist-Leninist theory and method through concrete examples. They will demonstrate how imperialist ideologists, by changing "theories" and conceptions, contend for the basic interests of the monopoly bourgeoisie and defend the exploitative and oppressive relations. At the same time they will show by concrete example how the enemy uses psychological and other data for his sophisticated anti-human manipulation practices and misuses in the mass media words and images for stupefaction and for arousing the lowest instincts and blind sentiments. Then they will immunize the young people most effectively against imperialist theories.

Our intention in political-ideological and educational work is not merely to instill a world-outlook in the young people, it rather must be developed into an active attitude toward the world. Insights and thinking methods of our world-outlook--and this conforms to its revolutionary character--have to be turned for the young people from "values as such" to "values for me." The values of our world-outlook and morality, in contrast to bourgeois value conceptions, are scientifically established and explicable. But understanding this per se creates no value relationship as yet; that requires the experience of these values. Experienced educators and propagandists will look at existing attitudes, opinions and moods and pick up experiences, induce young people to analyze, critically absorb and take issue with them in terms of their value from a theoretical standpoint.

Young people in the transitional age from childhood to adolescence, as one knows, develop strong self-assurance, sometimes all too pointedly. They seek to work out their ideas and values by themselves and to test them by applying them. As much as ideals have been realized and roads been paved in our socialist society, it would yet be risky for us to assume that it is altogether without problems for the young people of today to take possession of all this. Every generation and every individual must always again appropriate, acquire and achieve what is objectively worth having, preserving and defending. There is no other way for making convictions and attitudes unshakable, for establishing the active position that is needed for defending, extending and carrying on with what was achieved, and for adding new achievements to what there is which must stand their test today and tomorrow.

Not only should we explain interconnections and answer questions, we should also foster attitudes more and offer opportunities for proving them in practical deeds for our socialist cause. That is why we need more of an exchange of experiences on how we can create the conditions under which the young people's insights and acknowledgements combine with active attitudes and performances, with enthusiasm and the sense of sacrifice, and on how in test situations, in study and work and sociopolitical activities, convictions and attitudes can be proven and fortified through practical efforts.

Instilling Communist Morality

In the further development of socialism, in the struggle for highest science and production achievements, and in the fashioning of the new way of life, morality becomes a crucial factor. It was not by coincidence that the GDR's eighth educational congress picked up the Leninist thesis that all youth education, training and schooling should have to be an imparting of communist morality.[5] That calls for leading all education up to class-bound moral decisions, moral testing every day, in interhuman relations, and in the struggle for highest achievements. The consequences resulting from that kind of orientation are not understood as long as they are, as sometimes happens, interpreted merely in conceptual terms.

The basis and orientation for communist morality is the Marxist-Leninist world-outlook. It provides a scientifically established world view, a general mentality, that lays the foundations for moral decisions on behalf of socialism, the socialist fatherland, internationalist thinking, feeling and conduct, solidarity with all exploited and oppressed, a new attitude toward work, a willingness for performance, discipline, collective spirit, and creative thirking and behavior. Rationalization, the careful handling of working time and materials, an unimpeded operation of complex technical installations, the introduction of microelectronics, or the release and transfer of manpower are matters that bring with them many different moral demands. Conscientious, honest work for the socialist cause, the willingness to do any work that becomes necessary for socity, the discipline and responsibility for fine quality all must express the extent to which the Marxist-Leninist world-outlook and attitude toward the world have become everyday standards of living.

There may in life of course arise contradictions between ideological understanding and moral decisions, especially among adolescents. Young educated persons at times are inclined to theorize and reason about almost anything. In our educational work we must allow no gap between "great words" and "small deeds." Experienced educators are greatly interested in inducing young people time and time again to derive class-bound moral decisions from theoretical insights, helping them in this while practicing and fortifying appropriate conduct. Sometimes people still proceed from the indiscriminate notion that individual consciousness development would automatically, through political and ideological insight, give rise to moral consequences. Yet, while embedded within the totality of our ideology, morality is relatively independent. It aims directly at personal conduct, interhuman relations, and spheres of intimacy and presupposes an especially high degree of internal commitment, active attitude and identification. So morality cannot simply be "taught." It must be appropriated through confrontation and practical acts in individual decisions and collective testing. Young people seeking their place in life are very sensitive to moral questions. They seek ideals and models with which to identify. A certain inclination to be rigorous in one's moral judgment is one of the appealing peculiarities and privileges of youth. For educational work, that presents an opportunity and task.

Experienced educators will pick up the desire of young people for moral self-improvement. They will encourage young people to mobilize and apply their extensive knowledge, ideological insights and life experiences to situations making moral demands on them and to make their moral decisions consciously. Instruction and productive work offer manifold opportunities for it, and so does FDJ and pioneer work and extracurricular activity. They are, however, still too insufficiently being used. Much still happens more or less by chance, due to special occasions or events. Moral knowledge is sometimes imparted on too high a level of generalization still, exclusively on the level of overall social interconnections, needs and requirements.

It sometimes is simpler to identify with moral decisions in special class struggle situations and extraordinary test situations than to spot and evaluate the moral content of everyday conduct and social relations in one's own sphere of experience. But for every working person, and that includes every young person, it must first and foremost pertain, in his own sphere, to the moral responsibility for the socialist cause, the strengthening and defense of our socialist fatherland, the safeguarding of peace and the consolidation of socialism in the world, the materials economy, scientific-technical progress, discipline and order. We must help young people to pass from overall social and scientific-technical contexts to their own experiences and relations, their everyday study and work, their sociopolitical conduct and own decisions in life, and do so with full facts, vividly and without obtrusive sermonizing.

The coping with science and technology contains "tasks of enormous magnitude which youth must learn to understand as a task."[6] Especially young people must understand the scientific-technical revolution as a challenge to their own knowledge, skills, moral stance and performance. For the revolutionary fighter today, performance in production and science, in the struggle for top achievements and in innovator recommendations, what is esentially involved are moral questions. Without such personality traits as an attitude that will not be satisfied with what has been achieved and will always seek better results and more efficient solutions, without discipline, without the ability to work within the collective, and without endurance and persistence, high achievements are not possible anywhere--least of all in science and technology. We ought to launch more of an experience exchange on how we can establish an atmosphere in our polytechnical secondary schools where top achievements are challenged and rated as moral obligations. Creative thinking, seeking new solutions, boldness and the willingness to take risk should be stimulated morally and materially. Part of that would be to rate more highly, in the schools, in instruction, and in polytechnical and vocational training, that a risk is taken on behalf of new solutions than that one would play it safe along worn-out tracks. Experienced educators know how to create a level of demands, in instruction and in the collectives, that implies intolerance to mediocrity. They instill the awareness that it is immoral to take one's clues from the average, hide behind others, or live at the expense of

others. Such matters of principle with regard to a moral atmosphere and education also ought to be launched for discussions and exchange of experiences among the young people themselves.

There is also a connection here with the problem of the so-called general human moral values and norms. Marxism-Leninism stresses the class character of morality. Yet, with it, it recognizes that moral norms and values also relate to what is universally human, ethical experiences of mankind throughout the centuries. Moral norms and values like performing one's duty, conscientiousness, integrity, comradeship, respect for the aged, and modesty have been valued highly by the working people for centuries. Developed and enriched, they become firm elements of communist morality. With the continued shaping of developed socialist society conditions arise under which such universal human moral values and norms in interhuman relations and in the conduct of men are given their proper due. As implications resulting from that for our educational work, the eighth educational congress has pointed out that communist moral education includes ethical education in the sense of imparting universal human ethical values and modes of conduct, without being reduced to them.[7] Wherever we deal with young people we must not slight such matters as the ways and means of dealing with one another, courtesy, respect for the elders, cleanliness, and esthetic, cultured surroundings. Such norms and modes of conduct not only are compatible with our world-outlook and with communist morality, they are actually demanded by it and have to become elements of socialist ordinary life and regular habits. Thus, when we care for cleanliness, order, an esthetic and cultured atmosphere, for the conversational tone, frankness, integrity and comradeship in schools, homes, and FDJ and pioneer groups, it is not a matter of some secondary issues but amounts to ideological questions of principle in our educational conception and practice.

The rating of ethics and morality in education demonstrated by the eighth educational congress has in many ways animated the discussion and experience exchange. In pedagogs collectives the question is being discussed how the children's and youths' studies, work and sociopolitical activities at school can be shaped in such a way that the moral dimension contained in such activities comes out more clearly, moral motivation is more deliberatley developed and the results achieved also are rated more in moral terms. In many places, pioneers and FDJ members with interesting ideas also take part in such discussions. They are talking about how the pupils' studies is motivated as a right and moral duty, the results of study are evaluated accordingly, and a high demand level is created in the classroom with regard to the ethics of study. Many schools are developing traditions in contesting for top study results, for scientific-technical innovator achievements, for responsibility for the neighbor's learning success, for mutual aid, and for sponsorships by the upper grades for the lower ones, all of which is deeply moral in substance. Fine use is being made of the great moral-educational potentials in the pupils' work, their socially useful work in school, in the residential areas and, in particular, their productive work in polytechnical training and in the socialist enterprises.

We attach great importance to making the pupils aware of the social and economic contexts in which their own productive work is embedded and to motivating their work assignments and qualitative requirements politically and morally. Labor competition with its opportunities for making comparisons and moral and material inducement become important educational tools. The example set by outstanding workers, the atmosphere in the struggle for top achievements within the work collective, movements and traditions of conscientious work, such as "May Hand for My Product" and "Notes on the Plan," all this releases important ethical and educational potentials. The pedagogs collectives are now considering how the schools can pick up the experiences imparted by the moral norms on industrial conduct in the socialist enterprise. That could tap important educational reserves.

Schools and other educational institutions now pay more attention to the moral implications of collective relations. It has been realized that it is a decisive question for moral education to find out which norms and modes of conduct prevail within the collective, what the demands and requirements are, what role comradeship plays and mutual aid, and frankness and integrity, and what is tolerated, fostered or resolutely opposed. Experienced educators know that with respect to the atmosphere in the collectives and the style and tone of relations there are no "small" matters one might ignore or let pass. That starts with the level of demands that exists in this regard in the pedagogs collective itself because from there crucial influences are brought to bear on the ways and means of pupils' relations in school. If clear demands are raised and clear norms are set, and valuable traditions are developed, the most ordinary matters of schooling, of cleanliness, order, discipline, study and work conduct, mutual aid and responsibility, and social activity become moral issues. Schools that work in that manner do not lack situations for moral decisions nor opportunities for young people to take a position and reveal their true colors, to stand up to their ideas and cope with conflict situations. No frantic search for that will then be needed. In every party organization and every pedagogs collective we need more of a sense of that moral education, understood in the Leninist sense, has to be a component of ordinary educational procedures at school in its whole complexity.

NEED FOR INTENSIFIED 'HOMELAND HISTORY' STUDY DISCUSSED

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 813-819

[Article by Prof Dr Willibald Gutsche,department chief, Central Institute for History, GDR Academy of Sciences; chairman, central executive board, Society for History of the Homeland, GDR Cultural League: "Homeland Bonds and Homeland History in Our Society." A translation of the 1978 EINHEIT article by Prof Walter Wimmer, cited in footnote 4 below, is published under the heading, "Historic, Socialist Concepts of Homeland, Fatherland Analyzed," in JPRS 72782, 7 Feb 79, No 1644 of this series, pp 25-34. A translation of an earlier interview with Professor Gutsche is published under the heading, "'Socialist Homeland' Propaganda to Be Intensified," in JPRS 73433, 11 May 79, No 1679 of this series, pp 28-33. The translated discussion of the values and dangers of regional patriotism by a number of Leipzig Bezirk dignitaries is available in JPRS 74156, 11 Sep 79, No 1714 of this series, pp 13-26]

> [Text] The citizens' conscious creative participation in the continued shaping of the developed socialist society is to a marked degree affected by their bonds with their more immediate socialist home area, organic component of our socialist fatherland, the homeland of the entire GDR people. A political-ideological task not to be underrated therefore is to make homeland history, on a high scientific level, so vivid and interesting that it will still more become a source of pride in our socialist fatherland.

The GDR citizens' love for their socialist fatherland is among the most important factors that make us step into the new decade with optimism. Fatherland, homeland--that is not just the mountains and valleys, as a popular song says. The people's homeland, their faterland, is principally defined by the "given political, cultural and social setting"[1] in which the people live, work and struggle, which ultimately also determines their relations with their natural environment.

In the form of the GDR, which is the state embodiment of the best traditions of German history, our people created their socialist fatherland governed by true humanism, which, led by the workers class and its Marxist-Leninist party, became the home for all its citizens where they, in social security and safety, because of the real socialism they themselves have created, truly feel at home. "It is because its citizens have created this state together and have made it what it is today that it is a true home for all who live here, a homestead, a being at home."[2]

These fundamental conditions also mold the relations the working people in our country have to the local environment familiar to them, to their hometown, for instance, their more immediate home, which develops within the scope and as an organic element of our socialist fatherland. In this more immediate area of work and living, where they shape their relations to society and nature directly and concretely, where their affiliations are especially close through their sentiments and experiences, and through their occupational and social activities, the citizens experience most concretely the connection between regional, national and international events, between their socialist fatherland and the socialist community of states.[3] From this "skintight" relationship with their environment in which they are "at home" especially intensive rational and emotional relations arise that play an important role in their relationship with their socialist fatherland and greatly affect their feeling, thinking and conduct.

What the substance of these human bonds with one's home and fatherland is, that depends on the prevailing social relations, on class membership and the class standpoint. Homeland and fatherland are indeed historic categories. They do not exist outside of society, their substance is class-bound. Under antagonistic class conditions, the love for one's homeland and fatherland was contradictory in nature. Whereas the ruling classes deprive the people of the country's wealth and have been misusing the working people's especially close ties to their home area, and their love for it, for purposes inimical to the people, for the revolutionary and all other progressive forces, love for the homeland and fatherland has always been an essential source of strength in their sacrificial struggle for a home, for a fatherland, in which the people's masses can develop their creative capacities free from exploitation and oppression.

The socialist revolution has abolished the contradiction between the people's love for their home and their being dominated and exploited by the reactionary classes. For the first time in the history of our people, the working masses, led by the workers class and its Marxist-Leninist party, have conquered their own fatherland and homeland in the GDR, whereby they became the masters in their own land. In our country, that rid itself of exploitative rule, socialist homeland bonds have become a mighty force of the working people in their struggle for the continued shaping of the developed socialist society and the defense of their achievements.[4]

That also has given the people's love for their homeland a deeper and new meaning. Socialist love for one's homeland mainly grows out of the active participation in the revolutionary shaping of the homeland, from the experiences in the stuggle and in life, from the people's new relationship with their history and their natural environment, from their conscious and creative participation as active and decisive shapers of their own history. That includes historic understanding because one's own personal experiences cover only a historically brief period and creative participation calls for an awareness that ultimately can develop only on the basis of historic insights. Only in a historic frame of reference can the inevitabilities of social development, and thus the lessons of the past, the achievements of the present, and the tasks for the future become understandable and conceivable in their whole scope. Knowing of the birth and growth of our socialist state and of its firm historic foundation is therefore indispensable for revolutionary conduct today.

Homeland History--A Source of Pride in Our Socialist Fatherland

For gaining and conveying such knowledge, homeland history holds a high place value because the image of history and historic consciousness, after all, also form to a considerable degree the knowledge and data of homeland history. Many people, especially the citizens of the younger generations, gain their access to more intensively taking issue with the past and to insights into historic inevitabilities through homeland history. They are directly confronted with historic phenomena, processes and personalities, historic traditions and results of historic developments, and most visibly so through their concrete manifestations and testimonials in the field of daily life and work, and because they are particularly familiar with the present and past of their immediate living and working sphere, in which they themselves shape history, many questions asked of history mature within this concrete context.

The citizen's conscious, active, creative participation in the continued shaping of the developed socialist society, in his enterprise, his community, his residential area, where his relationship with the socialist state is brought to realization most directly, depends to a considerable extent on his consciousness of history, which in turn is closely interrelated with his knowledge of his homeland history, his relations to the present and past of his more immediate socialist home.

Finally, the working people's dealing with the history of their more immediate home area is an important element of life in socialism and contributes to the shaping of the socialist way of life. Knowing of the past of their homeland, being acquainted with its historic sites and with the cultural and scientific achievements performed there, and the awareness that one carries on the work of the revolutionary and other progressive pioneers, are essential elements in one's own revolutionary conduct and important conditions for feeling at home.

It therefore is a political-ideological task, not to be underrated, to encourage the working people's growing interest in homeland history, to make sure that the interest in homeland history will lead to knowledge about it, which will help deepen general historic knowledge and socialist consciousness. Knowing of the past and of the sacrificial struggle by generations of the best fighters of our people for a homeland freed from exploitation and oppression enhances the respect for the revolutionary and other progressive humanistic traditions of our people and helps develop and deepen the socialist love for one's homeland, socialist patriotism and proletarian internationalism. Rendering homeland history vivid and interesting then becomes a source of pride in our fatherland and of commitment to our socialist state.

Each place in our republic, every enterprise, every residential area is a piece of live history of our workers and farmers state that must be carefully brought to mind. Through it we can vividly illustrate the "historic reason" for our socialist fatherland as well as its dynamic development, the successes in the revolutionary struggles of previous generations as much as the achievements of our days, the magnitude of what has been accomplished. Homeland history thus helps deepen the realization that the "birth and growth of the GDR is the inevitable outcome and consummation of the centuries of struggle by the progressive forces in our people for a new humanistic German state."[5]

However, a better use of homeland history for molding consciousness is not attainable by simply assigning more space for it in our political-ideological work. In line with the resolutions of the Ninth SED Congress on higher demands for the social sciences and for history propaganda, we must also seek to improve the quality of work in homeland history. Both in its breadth and its scientific depth must homeland history be further developed.

To this task is devoted in particular the Sciety for History of the Homeland under the GDR Cultural League, where thousands of working people--lay and professional historians, in close cooperation with the history commissions at the party's bezirk and kreis headquarters, the committees of the antifascist resistance fighters, the local state organs, the territorial science facilities, the National Front commissions, the bezirk chapters of the Historical Society, the FDJ, the memorial sites, museums and community halls and so forth--help gain and disseminate knowledge and understanding of homeland history whereby to deepen the bonds with the socialist homeland as an essential foundation for the sense of patriotic and internationalist responsibility.

Homeland historians explore the past of their communities and are chroniclers of the revolutionary changes of our days. Folklorists and cultural historians deal with the history of the production, culture and way of life of the working classes and strata, reveal progressive cultural achievements and cultivate our folkloristic legacy. Numismatists

gain insights into economic history by exploring the history of money which they make available to the presentation of homeland history. Historians of prehistory and ancient history ascertain, document and preserve land memorials and help in conveying a scientific picture of the world, and the friends of the cultural-historic tin figure illustrate historic and cultural-historic events by a scientifically sound and emotionally effective display of figures, scenes and panoramas. They all, through the results of their work, enrich our intellectual-cultural life--through memorial sites, ethnological showcases and museums, through preserving and caring for historic monuments, lectures, excursions and exhibitions, press reports and scientific studies, the organization of local festivals and the cultivation of progressive popular customs.

The Society for the History of the Homeland intends to improve the social benefit arising from the activities that stem from these various inclinations and the passionate joy in discovery, the various skills and facilities. The Society seeks to deepen the theoretical and methodological premises. Above all it seeks a greater inclusion of homeland history in the cultural-political work in the territory, in regional and supra-regional research projects and propaganda tasks, more intensive analysis by educational institutions and more cooperation between lay historians and science institutions. It focuses on a most feasible long-term coordination, timely and thorough direction and care, and the development of new forms of mass effectiveness.

Engaging in homeland history so vividly that it becomes an essential factor in socialist conscicusness development can, of course, not be confined to the citizens affiliated in the Society for the History of the Homeland under the GDR Cultural League. Party and state functionaries who promote initiatives for making homeland history more useful for solving our current political tasks thereby release potentials for the further development of socialist national consciousness, and thus, for the development of the working people's creative initiatives in the economy and in other public domains.

A very important task of homeland history lies in our helping to write and disseminate the history of our socialist fatherland. The impressive advances by the people's masses, unprecedented in the history of the German people and inconceivable under capitalist conditions, became possible only through sacrificial struggles and efforts by the working people under the leadership of the workers class and its revolutionary party, and as a result of the fraternal aid from the USSR and the other socialist states. By the example of each village, each town, each kreis and each bezirk we can impressively demonstrate how our achievements were gained, augmented and defended by overcoming difficulties and contradictions and through heavy class struggle. Especially in this field of homeland history many interesting questions are still waiting for thorough answers, and here we must trace the effectiveness of the general inevitabilities in their specific manifestations and uncover, and make conscious, the dialectical connections between regional, national and international development.

Local chronicles deserve special attention here. The documents and materials collected, and chronologically and systematically arranged by the chroniclers, reveal much about the most recent political, economic, social and cultural development and about the natural conditions and environmental designs in our villages and towns. They not only are an important foundation for socialist historiography, but they also make possible imparting to the population a vivid picture of the most recent past of the specific locality while reminding the people. time and time again of their own share in it in a vivid fashion.

Among the traditions to be tapped still more for class-bound and patriotic education mainly are those of the revolutionary workers movement. Our republic, after all, principally is the heir and fulfillment of its more than hundred years of struggle. The cultivation of this tradition also continues to deserve special attention in the field of homeland history. This involves not only a deeper exploration and more effective propagation of already well-known events and developmental trends in the history of the local workers movement and of the achievements of its leading personalities, but also the gaining of new knowledge and insights into the emergence and formation of the proletariat as a class, the changes in its structure, and the thus far often ignored "levels" of the class struggle, the proletarian cultural traditions and the development of the way of life of the workers class and the other working classes and strata within the territory. Specific traditions in the history of the local workers movement, such as the Erfurt Party Congress of 1891, the illegal resistance struggle of Dr Theodor Neubauer in Tabarz, the struggle of the revolutionary workers against the Kapp putsch in Gotha and Ohrdruf--to mention some examples from one bezirk--call not only for taking care of the memorial sites and showcases, but also for a more intensive and systematic exploration and popularization of them, if they are to be come effective in the consciousness-forming sense, as nodal points in home territory's picture of history.

From the fact that we are the heirs not only of the revolutionary workers movement but of everything progressive "our people and mankind have gained throughout history in insights into the nature of the world and of man, and have created in ideals pointing to the future, in beauty and poetry,"[6] and from the realization that socialist historic consciousness presupposes a comprehensive image of history, the task arises also to include more strongly than we have done in our homeland history work, without any constraints, everything valuable and positive that has formed throughout the centuries in the bezirk, the kreis, the town and the village, and that finds its fulfillment and continuation, at a higher level of social development, in the socialist GDR.

This involves all achievements for progress in the various forms of our society, mainly all revolutionary struggles of the oppressed classes and strata, but also all the humanistic accomplishments by representatives of other classes and strata, particularly during the rising phases of any of those social systems. That includes, for instance, also the

far distant past, the traditions of prehistory and ancient history, the analysis of which will enrich our image of history. In addition to discovering the cultural achievements in those millenia in human development, prehistory and ancient history, from the study of which the classic authors of Marxism gained essential insights for their design of a classless society, can make important contributions to deeper insights into historic inevitabilities.

There is no place in the whole territory of our republic the past of which would be devoid of revolutionary struggles, of achievements for the development of the productive forces, of the struggle by progressive forces against reaction and the work of progressive personalities for humanistic goals, such as Bad Frankenhausen with the peasants' heroic struggle under the leadership of Thomas Muentzer, Wittenberg and Eisenach, where Martin Luther worked, Erfurt, with the activities of the humanists circle, Burg near Magdeburg, where the military theoretician Carl von Clausewitz lived, Sommerschenburg, where the Prussian army reformer Neidhardt von Gneisenau spent the last years of his life, to mention but a few examples. But even in this field of homeland history, it is not merely a matter of such well-known facts but, increasingly more also, of disclosing thus far still unknown progressive achievements which--while they partly may have only been effective within a restricted space--helped social progress to triumph, for which reason they are part of our inalienable legacy. In short: it is a matter of opening up our entire humanistic, democratic legacy.

Dialectics of Two Class Lines

The insight into the historic inevitabilities and the critical appropriation of our historic legacy demand that we understand homeland history, as all other history as well, "as it truly evolved and by what it was controlled--the dialectics of two class lines, the struggle between progress and reaction."[7] For one thing, the historic necessity and the importance of revolutionary and other progressive struggles, deeds and ideas, as well as the magnitude of the achievements by the forces taking part in them, can be measured, evaluated and appreciated only if we know their causes, impulses, goals and the political forms of the given class forces. On the other hand, homeland history cannot only deepen the working people's bonds with their socialist homeland by more intensively conveying to them the revolutionary and other progressive traditions, but also by a comparative analysis of diametrically opposed living conditions for the people's masses and ruling classes under the conditions of the exploitative society.

A higher grade of research and propaganda in homeland history mainly demands placing them still more solidly on the methodological principles of historical materialism. Here we especially have to do away with the notion that regional historical events merely serve as illustrations for general historic processes, that they only play a passive role. Such a presentation in homeland history contradicts all methodological principles

of the Marxist-Leninist conception of history because it ignores the objective dialectics of the regional, national and international.

The history of one's immediate home area is an element in the process of general history. Yet the universal inevitabilities have a specific way of asserting themselves in regional history, and the general process of history always also is at once a product of the specific and the particular. So one has to ascertain in what ways events and tendencies in homeland history have affected, conditioned or stimulated the process of general history and, vice versa, how general processes affected historic development in the home area, whereby one can present regional history understandably in its interrelations with national and world history. Here the history of socialist society in the GDR, the birth and growth of our socialist fatherland, should be given appropriate attention in its interaction with the development of the immediate home area. The main orientation in dealing with homeland history should, in principle, be directed at the cornerstones in the history of the German people in their specific regional manifestations. Homeland history will, in the final analysis, be massively effective only if presented concretely and vividly. Boring or dull presentations contradict objective historic events in which men always have acted and are acting with passion.

In understanding our mission in this manner, we shall succeed in giving more and more citizens access to a rational understanding and emotional appropriation of their socialist homeland in its historic dimensions and thus make an essential contribution to fortifying and deepening their love for home and fatherland. The home environment is placed in a new light. Familiar localities and landscapes combine with historic events and destinies. Squares, buildings and monuments, streets, alleys and meadows, palaces, castles and cottages are transformed into eloquent witnesses of important social and political confrontations and decisions, into arenas for heroic struggles between progress and reaction. Past generations of the popular masses and their striking leader figures shed their anonymity and become familiar to us in their life and work, their feeling, thinking and actions. We learn to empathize with their merits, their successes and failures, their defeats and victories, and with the magnitude of their achievements. This intimate encounter with history stirs justified pride in the achievements of progressive fighters of the past and reinforces our willingness to carry on their work at a higher level of development and to preserve and increase the wealth and beauty of our homeland, which now belongs to our people.

WILHELM PIECK YOUTH COLLEGE'S GROWING IMPORTANCE REVIEWED

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 pp 848-852

['Information' feature report by Dr Klaus Boettcher, director, Wilhelm Pieck Youth College, Free German Youth (FDJ): "Wilhelm Pieck Youth College--Cadre Forge of FDJ"]

[Text] In the history of the youth college, 14 September 1950 is of outstanding importance. In compliance with a request from the Central Council of the FDJ, the President of the GDR, Wilhelm Pieck, gave the highest educational institution of the youth association the right to bear his name in the future. The speech Wilhelm Pieck gave on the occasion of the conferment of his name expressed the high appreciation for the work of the FDJ and the great confidence the party was placing in the strength of youth and its political organization. "If there was one thing that has always filled us with great pride and innermost satisfaction ever since there has been a GDR, it has been our youth's attitude toward the GDR and the great elan with which it has approached the tasks assigned to it," he emphasized.[1]

The Wilhelm Pieck Youth College, known in our organization under the honorific, "cadre forge of the FDJ," has had an important share in forming cadre faithfully dedicated to the party in all situations ever since it opened in May 1946. On the day when the name was conferred, Comrade Erich Honecker, FDJ chairman at the time, assured the president of the promise "to do all we can to train at the school that bears your name the best FDJ functionaries, the most courageous champions of the young generation in the struggle for peace."[2]

The youth college always has sought to live up to that standard. Nearly 13,000 FDJ functionaries have thus far graduated from this educational institution so rich in traditions and are standing their test in responsible functions of the youth organization, the party, state, economy, the armed organs and other mass organizations. Numerous have been the concrete tasks the various generations of FDJ functionaries have been

fulfilling during the various phases of the birth and growth of the GDR on orders from the party and the youth organization. Common to them always was and is to move ahead of all youth, mobilize them for implementing the party's program goals and thus make a significant contribution to the further shaping of unity and revolutionary continuity among the generations in our country.

Party Policy First Hand

Explaining the basic issues of Marxist-Leninist theory to youth, helping them more deeply penetrate the essence of fundamental party resolutions and imparting cogent arguments on topical issues--this SED tradition was fostered by Wilhelm Pieck together with Otto Grotewohl and many other executive functionaries. Twenty times Wilhelm Pieck stayed with teachers and students on Bogen Lake. With great propaganda skill, marked by simplicity, directness and great relevance to life, he explained the party policy and answered questions with which the youth functionaries were confronted during their work. To the students, Wilhelm Pieck was the brave fighter of the German and international workers movement and loyal friend of the Soviet Union, where he had lived for many years. From the president himself they got authentic information on the first socialist state in the world and its people and on the Leninist comsomol.

Great joy and enthusiasm always again welcomed Comrade Erich Honecker when he would visit the Wilhelm Pieck Youth College. His speech in initiating the fourth one-year course in October 1954 became a guideline for training thousands of cadre. "It is a great honor and obligation to be a student at the Wilhelm Pieck Youth College," he said. "It means investing all one's skill and abilities, one's talents and gifts, in acquiring high-grade scientific knowledge. It means approaching these studies and learning with stubborn diligence, indefatigable energy and tenacity. It means affecting one's fellow-students through one's personal example, comradely, frankly and honestly, and taking part in the development of a strong course collective. To be a student at the Wilhelm Pieck Youth College means to work, study, live and struggle in the spirit of this great son of our people, this leader of the German workers class and its entire nation, this important Marxist theoretician, outstanding statesman and brilliant organizer."[3]

These words of commitment are heard since by the students of every course of study on the very first day of their arrival. They make a demand on the education and self-education of every youth college student. The wealth of thought in the speech by Comrade Erich Honecker to this day offers fundamental guidelines and impulses on how the cadre are to be enabled to meet the higher demands the 1980's are placing on the youth organization as the active helper and fighting reserve of the party in developing an unshakable class standpoint for the young generation, attaining a great increase in economic efficiency, and insuring the secure military protection of socialism, and on how they are placed in the position where they can give political and organizational leadership to the "FDJ Party Congress Initiative."

The implementation of the high FDJ objectives in preparation of the 10th SED Congress calls for cadre who fulfill their mission through solid, applicable knowledge, political conviction and revolutionary passion, who set examples for youth in their political stance and ideological steadfastness, their dedication and moral characteristics, who inspire bravery and are talented organizers, lead the political discussion in all youth groups, have respect for collectivity and distinguish themselves by great personal responsibility. They must be cadre who with political and organizational consistency attend to all the aspects of youth life, meet their test as fine propagandists and champions of our world-outlook and aim all their energy at the fulfillment of the SED program.

Young people have many questions and expect frank and party-minded talk about problems pertaining to the struggle by the Soviet Union and the other countries in the socialist community of states for the all-round strengthening of socialism and the safeguarding of peace, or those that touch on the causes for the exacerbation of the international situation by U.S. imperialism and its NATO allies, or on the variety of forms and the harshness of the class struggle in our time. Expert and convincing answers help further strengthen the awareness of the triumph of our cause and develop an active class position and the readiness for high achievements of one's own toward strengthening and protecting socialism. For the training of the organizational functionaries this demands imparting to them the kind of knowledge that will enable them to grasp the essence of complex phenomena in our time while creating many opportunities for them to prove their ideological steadfastness. Prerequisite to that are intensive study of the main works of the classic authors of Marxism-Leninism and a precise acquaintance with the resolutions of the party and of the youth organization, mainly the SED program and the FDJ statute. That will train them in the ability to argue persuasively on all topical domestic and foreign policy issues and on organizational matters, as that is done at the school, for example, through the agitators contest.

We must thus constantly give thought to how we can make more efficient and more compatible with concrete social requirements the training of the 270 functionaries who are getting their preparation in the one-year courses for becoming kreis secretaries, bezirk executives, or members of the FDJ Central Council. The general scope of the instructional program, as ratified by the secretariat of the FDJ Central Council, is aimed at equipping the students with Marxist-Leninist theory, SED policy and the specific implications derived from all that for youth, so that they are in the position to disseminate them effectively among the young generation. The teachers and associates in the five departments attach special value to providing an ideological and historical understanding of the dialectics in social developmental processes in connection with the revolutionary world process and to the skills in taking issue, combatively and convincingly, and from the positions of socialist theory, with imperialist policy and ideology, especially with anticommunism and anti-Sovietism.

The main field of the educational and training work at the Youth College is a systematically conceptualized and rigidly conducted teachers training, aided by various forms of education and self-education in the students collectives. Through this unity we succeed increasingly in enabling the students to spread Marxism-Leninism and its implications to conscious daily acts among youth in such a way that everyone can sense the intellectual wealth and practical relevance of that science. That also includes our developing in the students the desire constantly to "consult" the classic authors of Marxism-Leninism and also to continue studying after school, so as to acquire the correct political evaluation of the complex manifestations of our time and properly put into effect the militant spirit of our world-outlook in the ideological class struggle.

In his convocation speech to the fourth one-year course, Comrade Erich Honecker directed the teachers' attention to inseparably combining the teaching of Marxist-Leninist theory with social practice, making high performance demands on themselves and successfully coping with the various and differentiated forms of organizational work resulting from the specific interests and needs of young people.

Through closely combining study with test situations, the students learn to disseminate Marxism-Leninism as a science that is a guide for action and the mastery over which helps in coping with social tasks better and better. It is a high demand made on the training of young professional revolutionaries always fully to meet the social requirements and to live up to the standards set by the organizational activists group. That also applies in particular to the contribution large segments of youth make to strengthening the GDR economically. The steep improvements our economy needs also come from the constantly increasing weight of the economic initiatives from youth. That reserves a prominent place in our training to the matters of political and organizational leadership in economic initiatives by the FDJ, the strengthening of its contribution to the acceleration of scientific-technical progress, to a productive full-capacity use of our basic assets, to the struggle for the highest grade of labor, to a thrifty use of energy, raw materials and material, to production boosts in export-worthy products and high-grade consumer commodities, and to more efficient investment activity. The same applies to the study of the most progressive experiences of our best youth brigades. That is served by the "Treffpunkte Verbandspraxis" (Meeting Places for Practical Association [FDJ] Experience) at the youth college with FDJ functionaries as much as by the practical work done in the FDJ bezirk organizations, by sponsorships for basic FDJ organizations or youth brigades, and also by the activity of almost 100 students as propagandists in the FDJ study year. Thereby it is being insured that training never gets detached from the most progressive experiences in FDJ work but is enriched and perfected by it.

Also important are the Wilhelm Pieck Student Days. They are high points in the theoretical-practical work because they directly challenge and stipulate the scientific creativity, independence and organizational skills of the

students. Under the responsibility of the FDJ basic organization management, important events are prepared, long range, for it, for instance the Lenin seminars, "Shock Troop in the Struggle," held together with foreign students.

An element of the training program of an importance to the future cadre which is not to be underrated is that the students meet their test as organizers and cosponsors of great political events. This line of tradition started with many students taking part, during the first course the youth college gave, in the first FDJ Parliament in Brandenburg in 1946 and ranges all the way to the Fifth Friendship Festival of USSR and GDR youth in 1980 in Karl-Marx-Stadt. Thereby teachers and students help in organizing unforgettable experiences for youth. But also in the process of educating the FDJ cadre, high points like that and other forms of social activity, aimed at reinforcing the unity of thinking, feeling and action, play a great role. A solid legitimacy test for knowledge and sentiment is a fundamental condition for successful work especially for professional revolutionaries who are supposed to be able to convince young people and inspire them for our cause.

The Wilhelm Pieck Youth College also makes use of the great educational potential of the traditions of the workers class, of its party and of the youth organization as well as of the revolutionary youth models. The contest among all seminar collectives for acquiring the authorization to bear the name of a revolutionary model plays a key role in this. All members of the collectives familiarize themselves with the life and struggle of their revolutionary model and, by studying the best experiences of their struggle, get extensive ideas of the path they followed and a clearer understanding of their successes, difficulties and problems. Through becoming acquainted with their models, they discover characteristics and modes of thinking and conduct that help in coping with current tasks and further the willingness and ability for FDJ functionaries to contend for bringing the ideals of their models to realization, and help raise the efforts to deepen the young people's consciousness of history. Thus organization functionaries are reaching maturity whose supreme professional ethos lies in fulfilling with knowledge and passion any mission assigned by the party and the youth organization, "who are steadfast and faithful patriots, solid friends of the Soviet Union, and all-round educated functionaries, real leaders of youth who in every situation remain loyal to the workers class party."[4]

Successful on the Side of Good Friends

Since the day it opened, the Wilhelm Pieck Youth College has solved the tasks it received from the party and the youth organization, helped by energetic support of its friends. In the truest sense of the word it is a child of solidarity, especially from the most experienced and politically hardened socialist youth organization, the Leninist comsomol, in studying and creatively applying its experiences in cadre training. Above all, the young officers of the Soviet Military Administration in Germany were the ones who greatly

aided the FDJ in setting up the youth college. As early as in the first year of its existence, Soviet officers would often lecture there and help and advise the young teachers collective. Late in 1946, the Soviet Military Administration in Germany presented the youth college with a science library which also included V. I. Lenin's speech, "The Tasks of the Youth Associations," the most important Marxist-Leninist document on youth policy. Nikolai Ostrovski's "How the Steel Was Hardened," Aleksandr Fadeev's "The Young Guard," works by Maxim Gorki and speeches and essays of Kalinin and Makarenko had a great educational influence on the youth college students. They had lasting effects on the young functionaries' thoughts about the Soviet Union and its youth and helped further deepen the sentiments of firm and indestructible friendship with Lenin's country.

At the new stage of cooperation between the Leninist comsomol and the FDJ, within the framework of the "Peace Flight to the East," comrades at the Wilhelm Pieck Youth College also got the opportunity to go to the Soviet Union and study comsomol work there. As early as in 1951, the year of the first one-year course, leading comrades at the school went along on study trips to the Soviet Union sponsored by the FDJ Central Council. Experiences of the central comsomol school--which today is the Comsomol College that, since 1949, has also made possible the training of FDJ functionaries--in teaching Marxism-Leninism, in organizing study schedules, in cabinet work and management activity are much help to the training given at our youth college. There is an extensive exchange of delegations and lecturers going on, representatives of the youth college attend summer courses at the comsomol college each year and spend several weeks in Moscow to study, and the exchange of science papers has been expanded.

For 4 years now, all the students of the GDR courses at the youth college have also been admitted to this broad exchange of experiences. There is a special friendship train that takes them to the Soviet Union where they then study comsomol experiences in situ, as it were. Joint seminars on the communist education of the young generation, extensive exchange of ideas on the work of young professional revolutionaries, excursions to revolutionary memorial sites, meetings with veterans of the party and of the Leninist comsomol, and evenings in Soviet families help in mutual enrichment and further solidify our friendship. Of great benefit for cadre training at the youth college also has been the cooperation with the central political schools of the fraternal organizations in socialist countries.

School of Proletarian Internationalism and Anti-imperialist Solidarity

As FDJ and solidarity belong together, so the cadre forge of the FDJ has proven at all times a school of proletarian internationalism and anti-imperialist solidarity. When the FDJ gained increasing international radiating strength, many youth associations wanted to study the experiences of our youth work. In January 1958 the first one-year course for cadre from foreign youth organizations got started. Nearly 2,000 friends from 75 youth

organizations have up to now taken 22 one-year courses at the Wilhelm Pieck Youth College. Constant contacts between FDJ members and the representatives of friendly youth organizations have had a positive effect on the development of young professional revolutionaries. Our foreign friends become acquainted here day in and day out with real socialism and with our youth and its youth association. FDJ students in turn can familiarize themselves with the problems in the struggle of progressive world youth against imperialism, racism, apartheid and Zionism. They get acquainted with comrades and friends who in their home countries themselves underwent capitalist exploitation, torture and terror. At the tribunal, "We Indict Imperialism," held annually at the youth college and at the receptions given the delegations, they present shocking evidence for the crimes imperialism is committing against mankind, especially against youth.

The cooperation between the FDJ members and their foreign partners reinforces their sentiment of joint responsibility to the anti-imperialist struggle. That is underlined in all the concluding events in the international courses of study.

The training program for the international courses contains instruction in the basics of Marxism-Leninism and in the experiences with the birth and consolidation of real socialism in the GDR. That also includes an extensive excursion program and the attendance of major FDJ events. Thus our friends are acquainted with values and advantages of socialism and thus, with desirable ideals in their own struggle.

Still in another respect the Wilhelm Pieck Youth College makes an important contribution to the internationalist activities of the FDJ. Since 1964 the youth college has been preparing the "FDJ Interbrigadiers," the "Ambassadors in the Blue Shirt," for their assignments in friendship brigades on four continents. At vocational training sites in the People's Democratic Republic of Yemen, Guinea-Bissau, or Mozambique, the blue FDJ banner is waving, as it is at the construction site of the friendship hospital in Hanoi or of a delivery station in Sao Tome and Principe, at repair workshops in Angola or in Ethiopia's harvester-thresher compound, which helped the peasants in their harvest, or in the construction of a cement factory in Nuevitas, Cuba.

Our youth college has helped write the history of the FDJ and has traditions to which it will be committed always. It finds its most important task, in preparation of the 10th SED Congress, in continuing to train and educate such FDJ cadre that will "help the party educate steadfast fighters for establishing the communist society who act in the spirit of Marxism-Leninism."[5] Thereby it stands its test in the spirit of Wilhelm Pieck, whose name it has borne for 30 years.

SUMMARIES OF OTHER MAJOR 'EINHEIT' ARTICLES

East Berlin EINHEIT in German Vol 35 No 7/8, Jul-Aug 80 signed to press 13 Jun 80 'Resumes' addendum

[Text] Socialism's Peace Policy

[Summary of article by Prof Dr Stefan Doernberg, director, Institute for International Relations, GDR Academy of Political Science and Jurisprudence; chairman, GDR Scientific Council for Foreign Policy Research; vice president, GDR Committee for European Security and Cooperation; pp 691-698]

[Text] The basic humanistic concern of socialism, seeking the free personality development of man, and thus his liberation from exploitation and oppression, inseparably connects with the struggle for the peoples' life in peace and security, against the imperialist policy of aggression, and against the use and threat of force in interstate relations. Through the implementation of the peaceful coexistence policy, socialism also paves the way to the most favorable conditions for insuring social progress. All peoples, all human civilization, benefit from socialism's peace policy.

Solidarity--Humanism in Action

[Summary of article by Kurt Seibt chairman, SED Central Auditing Commission; president, GDR Solidarity Committee; pp 699-705]

[Text] The history of the organized workers movement also is the history of the struggle and of the solidarity of the working people and the oppressed. Proletarian internationalism is an irreplaceable weapon in the struggle against oppression and exploitation and for peace, democracy and progress. Our republic has always received solidarity and

has from the beginning, and increasingly more so, practiced solidarity. The GDR has stood by the peoples in their struggle for national independence, peace and social progress. The work of the GDR Solidarity Committee is an inseparable component of GDR policy.

Testimony to the Struggle for a Socialist German Fatherland

[Summary of article by Prof Dr Walter Wimmer, deputy department chief, Institute for Marxism-Leninism, SED Central Committee; pp 706-712]

[Text] The program declaration published 50 years ago by the KPD on the national and social liberation of the German people is among the outstanding documents of the struggle of German communists for liberating the German people from capitalist exploitation, imperialist oppression, fascist threat and militarist war policy. It most impressively demonstrates that the KPD, in its implacable struggle against fascism and war, pointed out the true path to a socialist German fatherland, which became a reality in the form of the GDR.

Rationality For or Against Man

[Summary of article by Prof Dr Georg Ebert, economist, director, Department of Political Economy of Socialism, Karl Marx Party College, SED Central Committee; and Dr Uwe Moeller, economist, senior scientific assistant at the party college; pp 722-728]

[Text] Free personality development and the well-being of man, finding their firm foundation in the public ownership in the means of production and the political power of the workers class in socialism, characteristically express real social humanity. Why are economic performance development, rationalization and higher efficiency, and the fundamental humanistic demand raised by socialist society, mutually interdependent? What marks socialist production as humanistic? These questions are answered in confrontation with bourgeois theses.

Rationalization in the Interest of the Workers

[Summary of article by Dr Horst Martens, director, Friedrich Engels SED Bezirk School, Frankfurt/Oder; pp 729-733. A translation of this article is published under the heading, "Petrochemical Combine Expansion, Rationalization Discussed," in a recent JPRS issue of EAST EUROPE REPORT: ECONOMIC AND INDUSTRIAL AFFAIRS]

[Text] Socialist rationalization is carried out with man and for his benefit under socialist production relations. His active participation in it is a decisive criterion. By examples taken from the Schwedt Petrochemical Combine the article demonstrates what tasks have to be solved in this, how the working people are recruited into active participation through our ideological work, and which problems are coped with in the process.

Humanistic, Progress Promoting College Education

[Summary of article by Dr (honorary) Hannes Hoernig, member, SED Central Committee; chief, Science Department, SED CC; pp 734-741]

Text] Science and education become decisive factors in the social reproduction process. That increases the demands, which are laid down in the Politburo resolution, "Tasks of the Universities and Colleges in the Developed Socialist Society." Based on that, the article emphasizes that all measures and deliberations for improving college education have to be based on the well tested principles of unity between training and education, teaching and research, and theory and practice. Many facts are adduced to explain the importance of these principles that must needs be considered as existing in unity.

Scientific-Technical Progress and Humaneness

[Summary of article by Prof Dr Herbert Hoerz, member, GDR Academy of Sciences; program director, Academy's Central Institute for Philosophy; pp 749-756]

[Text] Science and technology in socialism become increasingly more important means for implementing the ambitious socialist-humanistic goals. What prevents imperialism from coping with the scientific-technical revolution for the good of the working people? The article refutes theses of bourgeois ideologists of a "crisis in humanity" and the demands for a "new humanism." The article also deals with the connection between efficiency and humaneness and with ideological problems in the acceleration of scientific-technical progress on behalf of social progress in our society.

From Postulate to Action

[Summary of article by Prof Dr Wilhelm Girnus, director SINN UND FORM, journal of GDR Academy of Arts; member of the academy; pp 780-788]

> [Text] As an ideal postulate humanism has existed for millenia. But only socialist society, based on the abolition of the exploitation of man by man, and on the political and economic power of the workers class, can bring humanism to realization, provide it with new substantive and historic dimensions, and perform the qualitative leap from utopian to real humanism. The strength of socialism as it exists and the struggle by the popular masses are the basis for the worldwide breakthrough of real humanism and for preserving peace.

In the Field of Tension Between the Ideal and Reality

[Summary of article by Prof Dr Hans Koch, candidate member, SED Central Committee; director, Institute for Marxist-Leninist Culture and Art Studies, Academy of Social Sciences, SED CC; pp 789-797. A West German commentary on this EINHEIT article is inserted below this summary]

> [Text] Communist ideals embrace the goal as well as the process. They express tendencies and objectives that are inherent in the penetrating changes during the shaping of the developed socialist society. These ideals have absorbed progressive value concepts of past ages. In the literary and art products by socialist authors, the humanistic ideal appears as a direct artistic expression or as an element in the overall art design. The relation between reality and ideal in art and life is based on the dialectical unity between what has already been achieved and what waits to be achieved still.

West German Commentary

Bonn IWE-TAGESDIENST in German No 101, 7 Jul 80 'iwe-kultur' supplement

[Report from Berlin: "SED Against Literature Glossing Over Reality"]

[Text] The theoretical SED organ EINHEIT (No 7/8, 1980) has criticized a literature that presents socialist conditions in the GDR as being free of conflict and glorifies them. Embellishment was uncalled for not only because it gilded the picture of heavy going in development but because it denied the contradictions as the true impulses for real development.

Such embellishment thus could at the most create subjectivist wishful thinking but was unsuitable for the molding of ideals. Many works in GDR literature, EINHEIT continued, spoke of matters unattained, cumbersome, unfinished and even erroneous in the developmental history of socialist reality, without the "adversary" getting the idea he would want to tie their authors into knots. That would not happen when such critical presentations made the "ideational strength of socialist party-mindedness" perceptible. Those relatedness to reality was oriented to the fact that a contradiction did exist between socialist society's ideal and reality which time and time again would have to be resolved. Uncovering such contradictions could be a "form through which socialist party-mindedness expresses itself."

Women's Equal Rights--One of the Greatest Achievements

[Summary of article by Prof Dr Herta Kuhrig, director, Social Policy Program, Institute for Sociology and Social Policy, GDR Academy of Sciences; acting chairperson, Academy's Scientific Advisory Board on 'The Woman in Socialist Society'; pp 806-812]

> [Text] Karl Marx and Friedrich Engels showed the women's issue to be a class issue. Realizing women's equality is an inherent element of the historic mission of the workers class. The differences, of principle, in the social position of woman in the two social systems most vividly confirm both the antiprogressive nature of imperialism and the humanistic character of socialism. Whereas no capitalist country has resolved the women's issue, the implementation of women's equality under socialism is one of its greatest achievements.

International Class Conflict and New Demands on Socialism

[Summary of article by Prof Dr Dieter Klein, economist, social science dean (prorektor), Humboldt University, East Berlin; pp 820-827]

> [Text] Compared with the early 1970's, today socialism is developing under changed conditions. They are: (1) The new dimensions of the goals in the shaping of developed socialist society; (2) the tasks connected with the coping with the scientific-technical revolution; and (3) the deepening of the general crisis of capitalism, the advances of the revolutionary world process, the exacerbation of the international situation and of the struggle for detente and peace. From there, new and higher demands arise which are met by our party strategy and the mass initiatives of the working people.

The Current Crisis of the Capitalist Society in the USA

[Summary of article by Dr Herbert Aptheker, member, CPUSA Central Committee; director, American Institute for Marxist Studies; pp 828-835]

> [Text] Intensified exploitation, racial oppression, unemployment, inflation, and social insecurity mark the situation of the working people in the United States. Monopolist profiteering and rising armament expenditures are the most significant causes for it. The inhuman domestic policy of monopoly capital is in line with a foreign policy which, aggressively, jeopardizes peace, its escalation having been prepared over the long haul, and systematically so. The CPUSA is fighting in the front rank of resistance against reaction, uncovers the causes of the crisis and shows the way for a fundamental solution, which leads across a broad antimonopolist alliance.

Global Problems and Humanism

[Summary of article by I. T. Frolov, chairman, Scientific Council for Philosophical and Social Problems of Science and Technology, Presidium, USSR Academy of Sciences; a slightly abridged reprint of the first article in a series on philosophical, social and methodological aspects of these problems, published in Moscow VOPROSY FILOSOFII in Russian, No 2, February 1980; German version, EINHEIT pp 840-847]

> [Text] The political, social and philosophical aspects of the global problems are subject to scientific research as well as to ideological conflict. The Marxist-Leninist conception proceeds from the proposition that a complete solution of the global problems, being of deeply humanistic concern, is inevitably tied to the development of the socioeconomic form of communist society. While there are states with differing social systems, their requisite international cooperation in solving the global problems is an important contribution to the consolidation of peaceful coexistence.

MINISTER SPEAKS ON SIMPLIFICATION OF LAWMAKING

Budapest NEPSZABADSAG in Hungarian 13 Jul 80 p 5

[Text] Legislation is one of the fundamental means of society's state and economic leadership and management. Thus it is imperative for socialist development to have an up-to-date, clear-cut and stable legal system which is in harmony with social and economic conditions. A good law or order is capable of adequately serving the demands of society on as long a range as possible. But life is changing, constantly setting new requirements which must be followed by the law. The Ministry of Justice makes a codification plan for the government every 5 years, so that the up-dating of outdated laws can be carried out according to plans. We discussed this planned process with Dr Imre Markoja, Minister of Justice.

[Question] If regulations change too often, one cannot even study them, let alone learning or putting them into practice. And yet, the real value of a law depends on to what extent and how many of the interested parties are able to follow it.

[Answer] Indeed, the frequent change of laws is an existing danger. But this is partly unavoidable in our rapidly changing life. At any rate, the government is always trying to thoroughly examine the necessity of changing the law and to make statutory provisions lasting.

There has been an extensive reform of the law in Hungary in the past 10 years. This work is essentially finished and thus a system of law does exist which is suitable for present social conditions. Since it is hoped that we in the top legislative branch have enough time now to breathe, we can put more effort into putting the so-called "statutes of the lower levels" in order. An abundance of bureaucratic overregulation is to be found in this area, resulting in very dangerous legal red tape. There are about 4,000 statutory provisions today; most of these are not laws, law-decrees or government decrees but ministerial orders and injunctions. This

in itself is not little but if we also include the tens of thousands of directions, which have many names and titles but are all legally binding--such as, for example, "views," "recommendations," "ordinances" and "general orders"--it can be seen without any special survey that this area of our legal system is very complex.

Of course, the trouble is not that there are such directions, interpreting the statutes in the executive sphere, since these can also be valuable means of leadership. The problem is that these possibilities are being used excessively, thereby shackling legislation; the reasons for issuing them are unclear, and they sometimes hide in them orders which should be issued in statutes. The government recognized this some years ago and ordered the Ministry of Justice to examine, with the cooperation of the other portfolios, the lower-level statutes and the system of directions. Last year we were already able to report some results to the government, but the real "breakthrough" will need continued and thorough analyses which are needed to determine which portfolio's laws must be touched up and reframed.

[Question] Incidentally, if there are so many directions in legal guise which can hardly be clear to the parties concerned and which are for this reason difficult to implement, why are computers not being used?

[Answer] The development of a computerized record system was started years ago. In the Ministry of Justice, the organizational prerequisites for it already existed. We have even signed a contract with the Central Bureau of Statistics for the use of its machines. At present, experimental coding is being carried out in one legal branch: family law. The complete legal material on this subject--including the Supreme Court's mandatory views--are fed into the machine. We will computerize the entire Hungarian legal code according to the experience gained. Later we will want to include the practice of the law into this system, too. It is a future objective that even a district court or a district council be able in a few minutes to easily get a clear picture, of the existing statutes in the given matter, including the lowest-level regulations as well, and of the legal interpretations it must consider! Of course, to develop such a system is expensive and it cannot be done from one day to the next. Nevertheless, it will be an accessory indispensable for modern state government and very useful for the implementations of the law. But, of course, it will only be an accessory.

We will survey those areas first where extensive reframing and modernization is most urgent. The related tasks will be included in the government's new 5-year codification plan as well. We already know, for example, that the entire legal material of education must be inspected and reframed, material which is also extremely complex and unclear at present. We made an agreement with the minister of education that we will do this job jointly and as soon as possible. We must work in cooperation with the portfolios for only they can realistically decide on technical matters.

[Question] What other trends will the codification have in the next 5 years?

[Answer] We can answer this unequivocally only if the Council of Ministers will accept this program at the end of the year. At any rate, we will probably have priorities in the areas of economy and public administration. Not to mention others, the contract system plays an important role in the national economy. Experience shows that the contract system is not functioning properly. And the reason for this, aside from economic factors, is that we looked at the economy too idealistically when we did the legal regulations earlier. Of course, we could not foresee certain economic problems which later emerged. Our task now will be to examine how we can bring the legal system closer to life and what kind of--perhaps temporary--means would be possible for us to include in order to make the contract system work better.

[Question] There are those who say that the responsibility system is not working perfectly either, that the legal framework for decisions--and the responsibilities thereof--is not clear enough.

[Answer] In a certain sense, it is not even worked out. This statement was also heard at the party's leading bodies. The legal means--of criminal, civil, labor and other laws--do exist but calling people to account often does not happen nevertheless. In several areas the authority of decision-making is ill defined, with many overlappings and thus too many people can be held responsible--and this leads to the disappearance of the person really responsible. The decisionmaking structure must be thus examined, its legal framework, which must be the basis of responsibility, must be determined. The government ordered the Ministry of Justice to examine, together with the other portfolios and supreme national authorities, our entire system of contracts and responsibility and, on the basis of the results, to work out the conceptions which also indicate the direction which the continued development of the legal system should take.

[Question] There has been for a time a silent change in our public administration. However, there is still no extensive program for the improvement of administration.

[Answer] There will be. In order to further modernize and simplify public administration, the Council of Ministers decided to work out an extensive program, and even asked the Academy of Sciences to submit to the government its own research plan for the improvement of administration. As far as we are concerned, it is almost certain that in the course of the program's implementation a new law of procedures in state administration will have to be made. Its objective will be to make the procedural regulations help in taking simpler and more efficient administrative action on matters of the citizens and the various state organs, in strengthening the discipline of citizenship, and in further developing the democratic character of public administration. And there is a party resolution that requires us to improve the elective franchise in the name of the democratization of the state's functions.

[Question] The extent to which the masses take part in legislation is an excellent indication of the state's democratism. What do you, as Minister

of Justice, want to do to involve society even more than before in planning bills or--and I go even further--law-decrees so that they can this way become refined and assume a shape?

[Answer] It is my conviction that the possibilities at our disposal in this area are not yet exploited. I think the parliamentary committees must take a bigger role in the preparation of bills, for this in itself broadens the democratism of legislation. And they should do it before they have been established in practice when only formal changes can be made in them. I also find it feasible that the plenum of the parliament, in addition to the discussion of concrete bills, should make a periodic and extensive survey of legislation, including its trend in legal rights, questions of content and method of bill preparation, and its democratism.

The other possibility may be exploited by widening social and professional debates. Of course, even up until now, the flaw was not in a lack of social and professional debates concerning important bills but in the fact that these often were formal. We ourselves also contributed to this, for in certain cases we offered the bill for debate so late that everyone felt that there was hardly any time left for changes and for a thorough analysis and application of the observations. If we proclaim--and this is our conviction--that the social debate on the plans of bills and law-decrees is useful, then we must also be more efficient and organized in fostering these.

[Question] Indeed, this effort is very important in legislation, as it is the law that determines what we can and cannot do in our lives, and how the state and the economy should function. But however perfect a statute maybe, only practice will show its effect. Here is a new law. It is said that one of the most important effects of last year's Criminal Code is that the number of "prison dwellers" has decreased. Is this unequovocally good and is this what is expected of the law?

[Answer] This, too. The new criminal code, among other things, reformed our penal system as well and gives the courts more alternatives to prison terms than before. Sentencing can thus be more differentiated and more just, and the number of "prison dwellers" can indeed be decreased. True, it was pretty difficult to change the old practice of sentencing by the courts to the new regulations and possibilities. The change came slowly in applying more differentiated penalties instead of prison terms and in being more consistently strict where this is required by the new criminal laws. Thus I have the feeling that the courts' liberalism, that is manifest here and there, is--true, only in part--responsible for the dwindling numbers of prisoners. Of course, the basic tendency of the new criminal code is to incarcerate only those people whose reeducation can take place only there and where there is no alternative to restrain them further criminal acts. Those who can be restrained from further criminal acts by other means and penalties, must not be punished by inprisonment, the gravest penalty that can be carried out.

[Question] There are those who question the reforming character of prisons and the efficiency of the education there. What is your opinion on this?

[Answer] The new Criminal Code--and the resulting whole series of orders of execution--aims at making our prison system really serve education. It is a worldwide experience that the effect of the penalty is disproportionate to the huge financial and spiritual investment in developing the educational functions of the prisons. We tried in orders of penalty execution to make all activities--economic incentives--help as best as they can in changing the convicts' form of consciousness and views.

[Question] This needs a social background as well, of course.

[Answer] Absolutely. For the former convict can stay on the road of decency only in a suitable social environment. This is also a reason why it is fortunate that the new orders more closely connect the enforcement of penalty with the so-called after-care activity which has taken a favorable direction in the past years. There are more and more signs that society is taking a concrete and active part in reeducating criminals, especially in the period when they come out of prison and must find a place, and when their employers must look after them. There are many enterprises with which we have signed contracts in this regard, most recently with the auto plant of Csepel and the construction enterprise of Zalaegerszeg. I am convinced that these enterprises are doing this work very conscientiously.

[Question] But if there is no adequate differentiation in the prisons between the convicts--if a one-time offender is put together with a hardened criminal--their reeducation can hardly be effective.

[Answer] The new law-decree on penalty enforcement gave many possibilities for separation and differentiation. Thus, in addition to the different kinds of prison classes, there are already so-called temporary groups as well where the long-termers are being thoroughly and carefully prepared for life after release. So-called remedial/educational groups have been created where the newest results of pedagogy and health science are used for the common goal of education and healing. Higher security and disciplinary sections had to be established in order to put hardened criminals who cannot fit in under more intensive control. But many other new measures--such as, for example, the possibility of self-initiative organization--help in developing a much more differentiated system of penalty enforcement. At least we hope so. For life often vitiates even the most beautiful conceptions.

[Question] As, for instance in the new--new? 6-year old--family law that had social repercussions. Six years ago I talked with you about the new family law; as state secretary of the justice portfolio, you said then that this law, while it is extremely family and child centric, does not forcibly keep together families that have been disintegrated; it makes cultured divorce possible, for if the parties to the divorce go to court

with a mutual agreement, they do not have to "throw mud" at each other only to get the divorce. Now, after 6 years, we find that the number of divorces is very high. Does not the family law, which sanctioned the legal institution of the divorce-by-agreement play a role in this?

[Answer] Certainly it plays some role. While 90,000 marriages are made every year, the courts dissolve 28,000 marriages. The number of divorces was will 23,000 in 1974. But I think this is not a legal but a social problem; the law here plays only a secondary, albeit not insignificant, role. As we formulated the orders of the family law, our main goal was to defend the institution of marriage, to increase the responsibility of to-be-married and married couples toward each other and toward society, to help further strengthen the family, and to increasingly defend the interests of children. But it was also our goal not to force by law the continuation of marriages which could not fulfill their human and social role. We examined and analyzed--together with the women's council and other social organizations--the social background of divorces, the negative social consequences of divorces, and the effectiveness of legal regulation several times. With regard to the latter, we drew the conclusion that the legal regulation provided by the new family was basically right.

If there is something wrong in the area of the law, it is usually its application. This probably originates from the fact that some of the divorce judges do not yet have enough experience in life and the good judgment necessary for these matters, and thus a mechanical and schematic "administration" is not uncommon. Although I know that when the litigants for divorce go to court with a mutual agreement, there is no special factor to be examined, and this worries me a little. We are not averse to seeing what could be done--with a little refinement and adherence to the principles of the family law--to decrease the number of divorces. We submit the results of our inquiries and our proposals to the party and state institutions concerned.

[Szabo] Thank you for the discussion which showed that the new statutes, which meet life's requirements, are just as important as the requirement of legal stability. It is not a simple task to bring these two demands into harmony with one another. However, this would be desirable, as both of them happen to be in society's interest.

KOLAKOWSKI COMMENTARY ON DISSIDENTS, SOCIALIST SYSTEM NOTED

Brussels LE SOIR in French 22 Aug 80 pp 1, 3

[White paper by Leszek Kolakowski, Polish philosopher and writer: "Let Them Eat Socialism!"]

[Text] Following is an exceptional "white paper" written by Leszek Kolakowski, the noted Polish philosopher and writer.

Between 1955 and 1957 Kolakowski was one of the promoters of the movement which marked the end of Stalinism in Poland and opened the way to the famous "Polish October" of 1956. In the 1960's, as a professor at Warsaw University, he was one of the leaders of a democratic current which opposed the dogmatic trend which was raising its head in Poland. He was dismissed in 1966 and has been living in the West since 1967.

Formerly a professor in Canada (Montreal) and the United States (Yale University in particular), Leszek Kolakowski is currently a professor at Oxford where he is a fellow of the famous All Soul's College. He is the author of a number of works published in several languages, considered authoritative in the areas of philosophy and the history of philosophical and religious doctrines. His latest work is a monumental history (three volumes) of the main Marxist currents.

Kolakowski, who remains a Polish citizen, is one of the founding members of the KOR, the social self-defense committee, and the main democratic opposition group in Poland. He is the only member of the KOR to live abroad and its only spokesman in the Western countries.

A Polish joke tells of the history of a young man taking an examination at at the School for Communist Party Cadres.

"Tell us, comrades," the examiners ask, "what is the difference between capitalism and socialism?"

"Capitalism is synonymous with tyranny, inequality, injustice, misery, international hatred, war, oppression, corruption, and class struggle. Conversely, socialism gives us freedom, prosperity, equality, fraternity, progress, justice, and peace. . . ."

"Very good, comrade. . . Here is another question: What is today the most important task facing the party and the country?"

"To catch up with and outstrip capitalism."

This is an old joke going back to the happy times of Khrushchev, when the slogan of "Catching up with and outstripping capitalism" was fashionable and when the leaders were trying, still clumsily, to offer to the party, if not to the entire population, a vision of communism as an ideological value. Such attempts have been largely abandoned.

Throughout eastern Europe the question is not to know how to imbue the people with a communist and even Marxist ideology but how to survive. Surviving consists of convincing the populations that all the dreams of freedom and national independence are vain and that they should be satisfied with eating socialism. "If they have no bread let them eat cake" is as old as Marie Antoinette. . . .

However, the dike of despair has broken. The peoples have learned that they can extract concessions from the oppressing state only through active resistance and never by begging.

The fact that the current wave of strikes in Poland is generally considered as symptomatic of the gravest crisis experienced by the country in decades is not because of riots (there have been no riots), massacres, or repressions of workers as in 1970.

The party and the authorities were forced to recognize the elected representatives of the workers, to negotiate with them and to grant concessions virtually everywhere. This is an enormous event within the context of the communist system, its history, and its ideology.

The severity of the crisis, however, should not be measured from the exclusive viewpoint of the economic situation. Naturally, the situation is not bad but catastrophic. The leaders themselves admit this more or less openly. However, despite the terrible difficulties of daily life the virtually general scarcity, very low salaries, and the general chaos prevailing in the management and system of prices, the Poles are not dying of hunger.

Obviously, some reasons for the current decline stem from the structural crisis and the inefficiency afflicting all socialist bureaucracies. Other

reasons are more specific: years of underinvestment, a huge foreign debt, and a heavy burden of military expenditures. However, this is merely the least important feature of the situation.

Actually, not only the organized democratic opposition but intellectuals close to the "establishment" have been pointing out for quite some time that the Polish crisis could not be resolved exclusively through economic measures and that its roots were essentially political.

The Social Self-Defense Committee (a group better known by the initials KOR--Workers' Defense Committee--founded in 1976 to help workers who had been persecuted after the previous strikes) has repeatedly emphasized that the total loss of credibility of the party and the government, years of unkept promises, and the total break of the possibility to communicate between the governing and the governed, make any effective economic reform impossible unless related to political change.

The KOR is the dominant and best-known organ of the antitotalitarian movement in Poland. However, recently a study group known as the DIP (Experience and Future), which includes intellectuals some of whom are party members and work within official institutions, published (unofficially, naturally) studies leading to the same conclusions. They asked themselves what could be achieved within a political system imposed upon the country (Poland being dependent on the USSR and submitted to the one-party system). Their conclusion was that without major political changes which would give the population a minimum of self-rule and the government a minimum of credibility any economic measure would be doomed to failure. Without such changes, the DIP predicts, the entire social structure could crumble.

Unfortunately, truth is a product which the Polish governing class would be the least capable of producing. It is acting in a state of panic and is afraid of everything: of its Soviet masters, and of its own workers, peasants, intellectuals, and the church. . . . The only ideological dish which the system dares to serve and which it serves almost openly is that of frightening the Poles with the ghost of fraternal armor from the East. In other areas, the system reacts according to the situation. Above all, fearing the popular anger, it is ready to raise the salaries. Under the current circumstances, however, this would mean the printing of inflationary money and the inevitable recurrence of the situation which prevailed several months ago. For the time being, a stagnation is developing in Poland which creates as much hope as a grave danger. Naturally, no one wishes a general disorder which would trigger a Soviet invasion and a widespread massacre. As Jacek Kuron, spokesman for the KOR, has noted, the Soviets would invade the country only should they reach the conclusion that the leading team should be replaced on the spot, having proved itself incapable of guaranteeing the status quo.

Acting thus, however, they would have to face a situation which would resemble more that of Afghanistan than of Czechoslovakia.

The KOR which is actively helping the strikers and which has succeeded in developing an effective communications network, is opposed to riots and street demonstrations.

The authorities have two possibilities: There is, for certain, within the party apparatus, a trend to return to repression and to violent police counteraction to the peaceful pressure of the workers. This would be a dangerous choice. The detention of several hundred activists would resolve nothing. The party should face the workers' mass which even the huge police machine would be probably incapable of crushing.

There is, however, another choice: allowing the population to openly express its grievances, tell the unpleasant truth about the situation, allow the workers to set up their own unions (the existing ones are merely a department of the official bureaucracy), abolish censorship, respect legality, stop stifling all forms of cultural expression, put an end to the ubiquitous presence and immunity of the secret police or, in a word, start a procedure which would lead to democracy. Yet, this choice not only conflicts with the dogmas, ideas, traditions and communist habits. For obvious reasons, it is a major threat to the position, the power, and the privileges of the current leadership.

In the short-term, the most likely line to be followed by the party would be to try, yet once again, to make a few vague promises in the hope of a temporary appeasement, after which it would resume control of the situation.

However, a very important change has occurred meanwhile: No longer does anyone seriously consider the party's statements, promises, or appeals. The margin of effectiveness of fraud has dramatically narrowed. This is what makes the current impasse extremely perilous.

The uncensored press is already 4 years old. Police harassment and jail have been unable to intimidate its representatives. The newspaper ROBOTNIK (The Worker), which is only one of the publications of the opposition, has a circulation of 20,000 copies (this is another unprecedented fact in a communist state). Not only does this press provide the population with the necessary information but it makes it intensely aware of the fact that without freedom of expression and information any change would be precarious and easily reversible.

We now note that the Polish workers would like not only to see their claims accepted but made public. The fact that Polish television, this routine tool for lies, was forced, after 6 weeks, even though reluctantly and without mentioning the forbidden word "strike" announced that something had jammed the machinery and that Edward Gierek had been forced personally to appear in front of the nation, proves not only that the authorities are aware of the gravity of the situation but also that the people's pressure, in the search for truth, is deeply resented by the leadership.

Despite a number of discouraging experiences of the socialist system, in which nothing appears to be functioning properly with the exception of the police and the army, the hope remains for a nonviolent change. It is clear, however, that even if granted with an eyedropper freedom could be achieved only through popular pressure.

Now it depends on the attitude of the leadership if the situation is not to degenerate to an uncontrollable level. Should the authorities, facing the workers who are providing admirable examples of calm and a feeling of responsibility, resort to violence, anything could happen. Poland is fed up with the reign of lies and obviously is not letting itself be appeased by meaningless phrases and promises without guarantees.

DISSIDENT PUBLICATION REVIEW OF PPN'S FOUR-YEAR RECORD NOTED

London DZIENNIK POLSKI in Polish 19 Jul 80 p 6

[Article by Tadeusz Taski]

[Text] We are reprinting this article from the dissident Polish periodical GLOS, the latest issue of which (no 5-6/1980) came out toward the end of June 1980. GLOS is edited by Antoni Macierewicz, Piotr Naimski and Marek Tarniewski. The address of the editorial office is: c/o Antoni Macierewicz, ul. Klaudyny 34, apt. 126, Warsaw.

We are dedicating this article to the editors of the periodicals MYSL POLSKA in London and NARODOWIEC in Lens who with a crazy stubborness continue to claim that the works published by the PPN [Polskie Porozumienie Niepodlegosciowe; Polish Covenant for Independence] are "the handiwork of Sanacja-era Germanophiles in league with revisionist circles in the FRG."

Since May 1976 publications signed by the Polish Covenant for Independence have been appearing in the Polish emigre press in the West. The authenticity of these publications is disputed by representatives of the PPN, including the well-known emigre Polish intellectuals Gustaw Herling-Grudzinski, a prominent journalist for KULTURA published in Paris and the author of the concentration camp memoirs entitled "Another World," Maria Winowska, a Catholic journalist who before the war founded the journal VERBUM which was associated with Father Wladyslaw Kornilowicz and with Laski, Jerzy Lerski, a history professor at a university in California, and Leszek Kolakowski, a former prominent Polish Marxist. They are vouching only for the authenticity of the articles, and not for their contents, but their names lend considerable prestige to the PPN.

These publications have also appeared in Poland, having been printed by the PPN without the approval of the censors, and some of them were

reprinted in book form without the approval of the PPN by NOWA [Niezalezna Oficyna Wydawnicza-Independent Publishers Printshop].

As is apparent in light of the statements made to date by the PPN, it is not a conspiratorial organization. Perhaps the PPN should be regarded solely as a collective pseudonym for a group of people residing in Poland who, through their writings, would like to lend impetus to a public debate on the current state of the nation and on ways to reform the existing system of government and to regain national independence. This activity is aimed at rebuilding the spirit of public opinion that was destroyed by the communist government. These publications can also be used as topics for debate in young people's self-education groups. Some of them were written expressly for this purpose.

Nearly forty of these papers have been published thus far (study no 41, entitled "Arts Education in the PRL," recently reached the West--editor's note). They are published more or less once a month, and the size and frequency of these publications is gradually increasing. Some of the themes taken up by these papers include the platform of the PPN, several topical discussions of the current social and economic situation in Poland, essays on Polish-German relations, and several important articles on the political history of the interwar period.

In the inaugural publication dealing with the PPN program the authors list the key points that define their outlook, i.e., the sovereignty of the Polish state, the equality of all citizens before the law, the unique role of Catholicism in our country, Poland's tradition of tolerance, and its close ties with the traditions of Western civilization.

The authors of the program declare their goals to be the restoration of national independence, the restitution of civil liberties, the establishment of a multiparty democracy, economic prosperity, the promotion of the arts, and the opening up of Poland to the outside world.

They elaborate on these goals in the next section of the program consisting of 26 points, which can be divided into three parts:
--the reform of political institutions, i.e., the restoration of parliamentary democracy, free elections, freedom of speech and association, freedom for workers organizations and private enterprises, the independence of the judiciary, autonomy for the universities, and the recognition of the legal and political status of the Catholic Church;
--foreign policy reforms, i.e., reconciliation with the Russians, the establishment of friendly relations with the Lithuanians, Byelorussians and Ukrainians, the improvement of relations with Germany, and the establishment of closer ties with the EEC (it is fitting that we should note the distinctions made in terms of the language used to describe relations with these different nations--author's note);
--economic reforms, i.e., drawing lines of demarcation between the political and economic spheres of our national life, the free development of private

economic initiative, the return of trade and commerce to the private sector, the passage of laws guaranteeing the legal status of private-sector agriculture, worker participation in the management of business enterprises, and making it possible to buy stocks in business enterprises.

This program is poorly written, some of its points are unclear, and the authors do not suggest any ways to put it into practice. Some of their proposals are provisional, stopgap measures that are supposed to be carried out at once, while others are intended as long-term goals. In addition, and this is by no means insignificant, their descriptions of the current situation are interspersed with demands for change. Unfortuantely, it also must be noted that the PPN program totally overlooks the problems of health care services, social welfare, pensions and retirement plans and says hardly anything at all about education. And even at a later date it turns out that the PPN did not see fit to take any interest in these issues.

One thing can be said in defense of the PPN. Namely, apart from the less well-known and--so it would seem--discontinued "Program 44," its program is the only one that offers such far-reaching proposals. This is very important. This program serves as a reminder of the maximum goals of the Polish people, i.e., national independence and democracy. The democracy we are talking about here is labeled by the communists as bourgeois democracy. In its subsequent activities the PPN has all but ignored the problems of political and economic reform raised in its original program. It has instead focused its attention on entirely different problems. In this connection we can distinguish two periods in the history of this organization's activity, the first of which ended in the spring of 1978. Up until that time the PPN had published three statements dealing with current political events, and in its publications it concentrated on two issues, i.e., the sovietization of Polish society and the formulation of a mini action program for the average citizen.

During the second period the PPN set utself up as a sort of think-tank, a position which it maintains to this day. Consequently, its main interests were the political history of the interwar period, Polish-German relations, and certain specialized problems of contemporary Polish life, e.g., the economic situation, alcoholism, the role of rank-and-file party members in public affairs, or the site of the massacre of a couple of thousand Polish officers from Starobielsk in 1940 by Soviet authorities.

While during the first period almost all of these publications were signed in the name of the PPN or its Discussion Groups and represented the views of all PPN members, during the latter period these tracts were signed with the pseudonyms of individuals and expressed only their personal views. It was not until recently, i.e., the spring of 1980, that publications reappeared bearing the signatures of Discussion Group members (the only exception being the study on the Germans and the Jews).

The question which asks "what is the PPN" is geared more toward finding out what is unique about this organization than it is toward identifying those

aspects that link it with other currents of contemporary Polish political thought. The differences in the outlooks of individual groups revolve equally around shifts in emphasis (the PPN probably attaches greater importance to the issue of national independence than other groups), answers to specific political questions (e.g., how do we rate the chances for the implementation of political reforms or what should our attitude be toward German reunification), and the discussion of issues that do not receive very much attention in the press of other organizations.

The views expressed during the first period in the history of the PPN are much more indicative of its real character than those espoused in its later works. These views can be summarized as briefly as possible as follows. The political system under which we live is incorrigible. No reforms will make it any better than it already is. It has to be changed in a radical manner. But at the present time such a radical transformation is impossible, since the feasibility of such change is a function of the international political situation. And the Soviet Union does not want any changes in Eastern Europe. As the authors writing on behalf of the PPN point out, the present situation is also unfavorable in view of the fact that all of our current activities should be geared toward making preparations for the future. We must get ready for the day when we will be confronted with a more favorable alignment of political forces.

And we have a lot to do in this regard, because this system has consistently been working toward the corruption and debasement of social life in Poland. The essence of this system is not physical terror, but rather the organized deceitfulness of the state. This system of organized coverups, biased news reporting and outright lies is reshaping our culture, consciousness and standards of personal behavior. This is precisely what is meant by the term "sovietization." The PPN has paid a lot of attention to this, and its studies on this subject are among the most interesting. So, instead of trying to summarize their views in our own words, we will offer a few quotes from its publications.

"The mixture of muddleheadedness and pedantry, the combination of corruption and terror and the duet of noisy patriotism and servility toward our powerful neighbor to the East, these are the innovations of a system which owes its longevity and stability neither to physical coercion nor to the effectiveness of its rule, but rather to the fact that it appeals to the negative traits of human nature, aiding and abetting those traits, weakens the moral fiber of the individual, and rules these so weakened without hinderence or objection. Namely, it appeals to laziness, helplessness, selfishness, and cynicism. It finds a way to work its will with every private citizen by playing on his defects. Less cruel than the despotic systems of days gone by, it is incomparably more demoralizing than they ever were.

"The Balance Sheet of Our Weaknesses"

"The average citizen is or rather is becoming apathetic, docile, forebearing, and, at the same time, bitter, hypocritical, cynical and totally incapable of thinking in political terms . . . . Embittered and dogged, he is being transformed into a model citizen of the Soviet type always chasing after any goods and services that are always in short supply. He learns these habits through the endless routine of everyday life in his place of work and at the countless meetings where he is supposed to be protesting against something or other, and so on. It is after all true that the inculcation of cynicism, hypocrisy and conformity gets under way as soon as children are in kindergarten."

"The Paradoxes of Sovietization"

"For it is true that lies form the foundation of our system of government, that is, as a Soviet-type political system . . . . As long as things stay more or less settled in Poland, this country appears, in the eyes of an outside observer, to be a fairly normal country where things are getting better all the time, the only problem being that it is burdened by bureaucracy, material waste, and so on. If one were to ask people how they felt under these circumstances, they would be hard put to conclude that their country suffered from any lack of independence. But just let some political crisis rear its head and all Poles, from the first to the last secretary of the PZPR, from the professor to the charwoman at the university, will rush to offer the opinion that unless this crisis is solved the Soviets are going to intervene and that blood will be shed in the bargain . . . . We know how things really stand, but we will try to avoid talking about this as long as we can . . . . So, one is bound to conclude that most people would prefer not to be given any detailed knowledge about the restrictions they are really faced with when it comes to the freedom of speech and information. This ignorance is a kind of refuge, sometimes being a face-saving measure and sometimes resulting from the gloomy conviction that a knowledge of the truth leads to desperation, which in turn leads to nothing since the omnipotent evil that is our lot is not going to be eradicated anyway."

"Thoughts About the Fatherland of Today"

The passages about sovietization quoted above were written immediately after the current opposition movement came onto the scene and they served, in my opinion, as a warning against overenthusiasm at that point in time. This of course does not lessen the importance of the views expressed in these passages, namely, the belief that Polish society exists in a state of profound demoralization and degradation.

However, it is possible to reach differing conclusions as to the duration and causes of this demoralization. We would do well to remember that we live in a country in which for almost all of the past 300 years (since the

days of Jan III Sobieski) the national government has been held in low esteem by the general populace. This government was controlled sometimes by foreigners and armies of occupation and sometimes by our own people. But even in the latter case it was a government imposed by outside forces, or its legality and sovereignty were at least open to question. There were only a few shortlived exceptions to this general rule, e.g., the government that held power during the period 1918-1926 which, under extremely difficult conditions compounded by protracted military and economic conflicts with our neighbors, succeeded in rebuilding the administrative infrastructure of the Polish state. We have no way of knowing how the Polish people would have reacted if a government had really existed that was universally accepted, and respected. The capabilities of the Polish people for exercising discipline and self-control under such circumstances were revealed recently during the visit of the Pope, the only leader who enjoys this kind of prestige.

But let's get back to the PPN. The assessment of the current situation outlined above leads it to the conclusion that it is necessary to come forward with a mini action program for our citizenry that will make it possible to start right now waging a struggle against the gradual sovietization of Polish society.

The PPN studies such as those entitled "How to Obtain Information," "The Citizen and the Security Services," "A Program for Polish Families," or "The Limits of Obedience," are attempting to show people how to emancipate themselves against the pressures applied by the security services and how to raise their children and to delineate the morally permissable limits of cooperation with the authorities (e.g., when is a person discredited by joining the party?).

I do not care for any of these commentaries and their conclusions are banal. But one still has to recognize the seriousness of the problem itself.

The PPN is the only organization that is trying to put together what Bohdan Cywinski has called a social code of conduct. This is an extremely cirtical issue, and by the same token it has been totally disregarded by the rest of the opposition movement.

The kinds of actions that have been advocated thus far include the setting up of citizens' committees, the publication of periodicals and books, the dissemination of these publications, giving aid to the victims of repression, the organization of trade unions and so on. These are activities for people who want to and are able to risk a great deal.

The discussion club "Experience and the Future" does nothing more than advise the government on what it ought to be doing, while on the other hand it has nothing to offer in the way of suggested activities for ordinary citizens who are not party members.

Only the Catholic Church has come up with some kind of mass program along these lines. One might mention, for example, that the "oasis movement" of Father Franciszek Blachnicki suggests that people should live without lies and fight against the plague of alcoholism. This is at least something.

So we are still looking for this miniprogram. Such a program ought to comprise precepts dealing with three spheres of human life:
--the world of work, i.e., how should we conduct ourselves at work and to what extent should we take part in trade union activities;
--childrearing in the home, including, inter alia, supplementing their knowledge of history and teaching them to be nonconformists;
--public affairs, e.g., learning how to live without lies, which in practice means that, among other things, we must boycott sham elections to the Sejm and refuse to take part in peace movement activities that are manipulated by the communists.

This program could be supplemented in practice with a broadly construed program of civic self-education for young people. Much of the work now being done by the opposition is dedicated to this purpose, even though these efforts are not talked about very much in the theoretical deliberations on the goals of the opposition movement. This is also the aim of most of the publications put out by the PPN, especially those written during its second period and devoted to topics in political history, e.g., works on Roman Dmowski and on Latvia, Lithuania and Estonia.

During this latter period the political views of the PPN have been much less noticeable. Apart from Jerzy Bartecki's monograph entitled "The Derailed Economy," there is only one political problem that has been talked about in the journalistic publications of the PPN. Here I am thinking about the question of Polish-German relations, which was the subject of three essays. To be sure, one may have doubts about the optimistic vision contained in these essays concerning the possibility of a Polish-German reconciliation. But in my opinion one cannot have any doubts about the validity of the basic premise advanced in these essays, namely, that the attainment of national independence for Poland is tied in many ways to the reunification of Germany. This unwelcome truth ought to be the subject of dispassionate debate, but instead it is greeted with heated, indignant and emotional reactions both at home and in the exile community abroad, both in the government and among the public at large. The current Central Committee secretary in charge of foreign policy affairs went so far as to personally hurl insults at the PPN [for uttering this truth] in an article published in the journal SPRAWY MIEDZYNARODOWE.

It is sad that such an enormous gap exists between reasoned political debate and emotional attitudes concerning Germany. The inherent difficulties associated with conducting a debate on this issue are related to the absence of a political culture in our country. It is rather a pity that

among all of the things that the PPN has accomplished thus far it has never paid the slightest attention to this issue. The PPN has concerned itself exclusively with political goals, without taking any interest at all in how a democracy really works or in the fostering of a democratic political culture which makes it possible for a democracy to work.

In direct contrast to the position of the PPN there is Marcin Krol's book entitled "Style uprawiania polityki,"* [Styles of Political Action] which is concerned solely with the modes of political action and thought, and the author's allusions to specific realities of life in contemporary Poland are so discreet that the uninformed reader might regard this book as being a mere anthology of rightminded generalities. There is a lot more than that could be said to enlarge upon and substantiate this judgement. And so we are left with a political theory viewed as some kind of strategic game that confines the rules and methods of political action to one compartment, Poland's maximum political goals, i.e., independence and democracy, to another compartment, and reserves yet another compartment for such concrete and short-term goals as independent trade unions and a free press which are being realized in practice by an active opposition movement. What we need is a vision that embraces all of these things at once. A vision that unifies thought and action. On this sad note let us end this lament.

DEFENSE MINISTER STRESSES CAPABILITY TO REPEL AGGRESSORS

Bucharest ANALE DE ISTORIE in Romanian No 2, Mar-Apr 80 pp 3-19

[Article by Maj Gen Constantin Olteanu, minister of national defense: "The Victory Against Fascism in World War II--A Result of the Struggle of Peoples for Freedom, Independence and Social Progress"]

[Excerpts] Carrying on the work of building a multilaterally developed socialist society, the Romanian Communist Party devotes all its attention to the strengthening of the defense capability of the country, to the proper equipping and training of the armed forces, to the training of the patriotic guards, of the military formations of the youth and of the entire people. In the spirit of the principles of foreign policy of the party and state, our armed forces are strengthening relations with the armed forces of the member states of the Warsaw Pact and with the armed forces of the other socialist countries and of other friendly countries, always ready to fulfill their obligations to their own people and to the allies of Romania.

In accordance with our party's views on the defense of the country, in the case of aggression by a foreign state or any situation which would affect, in any way, the sovereignty and integrity of the Socialist Republic of Romania, national defense would be carried out unceasingly, in all conditions, in forms appropriate to the circumstances, including the form of armed popular resistence, until the invader is driven out. As a result, the war which our country would be obliged to wage in the case of possible aggression would place the invader, from the very beginning, face to face with the entire people who would defend, in an organized manner, their own land, their own property, and their own destinies. It would mean a total response--military, political, ideological and diplomatic--carried out on the national territory, an action in which not only the armed forces but also the entire people risen up in struggle against the invading army, will be involved in a united effort.

The unity of the army and the people is reflected in the passionate activity of the military personnel for the fulfillment, with superior results, of the plan for the combat and political training of units and large units, in accordance with the current level of the technical equipping of the armed forces and with the demands made by the realities of the modern battlefield and our party's views of the defense of the country.

WW II PROPAGANDA ACTIVITY OF ROMANIAN COMMUNISTS IN USSR RECALLED

Bucharest ANALE DE ISTORIE in Romanian No 2, Mar-Apr 80, pp 108-125

[Article by Gheorghe Unc and Vladimir Zaharescu: "Romanian Propaganda From the Emigres During World War II"]

[Excerpts] The unitary character of Romanian anti-Hitler propaganda was demonstrated both in the propaganda organized by the internal resistance and in that of the emigres. Indeed, an examination of the documents and materials characteristic of this propaganda prove, without a shadow of a doubt, that the great themes treated, corresponding to the major objectives of the movement for the liberation of the Romanian people--the assurance of the independence and sovereignty of the country, the overthrow of the Antonescu government, the break with Hitler's Germany and the withdrawal of the country from the war against the Allies, the abrogation of the Hitlerite Diktat of Vienna by the liberation of the northern part of Transylvania, the installation of a democratic regime--were common to the propaganda of the Resistance within the country and the propaganda carried out outside the country, by large collectives of anti-fascist emigres or by political personalities, Romanian diplomats, cultural figures, etc. This fact permits us to state that the propaganda from the emigres represented, in essence, an extension of the propaganda in the country, a component part of Romanian anti-Hitler propaganda, in general.

In the framework of this unitary character, propaganda drom the emigres, naturally, had a number of specific characteristics compared to the propaganda within the country, because of the different conditions under which it was carried on, the different methods which it used, and the milieu to which it was addressed. Emigre propaganda had special characteristics because of the country in which it was carried on. It is easy to understand, for example, the difference between conditions in France, where the propaganda of the Resistance was carried on clandestinely, and conditions in the countries of the anti-Hitler coalition, especially the USSR, where this propaganda, along with being legal and encouraged, enjoyed support given by material means of propaganda.

A particularly important distinctive characteristic of Romanian anti-Hitler propaganda in the USSR was the fact that, organized initially by the group

of Romanian Communists who had emigrated there--including such militants as Ana Pauker, Vasile Luca, Dumitru Petrescu, Gheorghe Stoica, Boris Stefanov, Leonte Rautu, Mihai Burca, Petre Borila, Valter Roman, Dumitru Coliu, Vanda Nicolschi and others--it soon took on new dimensions, becoming a form for the manifestation and activity of the broad anti-Hitler movement which was produced in the ranks of imprisoned Romanian soldiers and officers. The propaganda of the Romanian anti-fascists in the USSR had a multifunctional and multidirectional character, addressing itself to public opinion in the country, to Romanian troops at the front, and to the masses of Romanian prisoners of war.

In order to address themselves directly to public opinion in the country and to the Romanian armed forces, Romanian anti-fascist propaganda on the territory of the USSR used: "Romania Libera" [Free Romania] radio station; Romanian-language broadcasts of Radio Moscow, for which a number of Romanian Communists were working; the dissemination in the ranks of the Romanian units at the front--in particular, by means of Soviet aircraft--of manifestors, letters and appeals from imprisoned Romanian soldiers and officers to their comrades in the respective units, brochures, etc, and well as radio broadcasts to the front.

The "Free Romania" radio station made a remarkable effort to expose to public opinion within the country the character of some measures adopted by the Antonescu government and the policy of Hitlerite Germany toward Romania and to inform the public on sabotage actions of the Hitler war machine, on the economic situation, on the actions of the repressive apparatus, of the dictatorship, etc. The maintenance, as much as possible, of contact with the realities in the country was assured by a permanent radio monitoring service organized within the editorial staff of the "Free Romania" station; studying the press of the country, which was received, with inevitable delays, through neutral countries; by means of information received from Romanian prisoners and through other sources of information. Thus, "Free Romania," just like the clandestine patriotic press in the country, was able to inform its listeners about some domestic situations and events which were not revealed by the official organs of information in the country, including: the agitation in the ranks of Romanian military units, the position adopted by some high-ranking Romanian officers who opposed the continuation of the use of the Romanian armed forces on the anti-Soviet front, and attempts, which were taking form even at the level of the higher command, to salvage the Romanian armed forces and to maintain their strength, for a struggle for the liberation of the territory taken from Romania by the Diktat of Vienna.

As we said, a group of Romanian Communist emigres worked on the Romanian-language broadcasts of Radio Moscow. This station was the official spokesman of the Soviet Government and its broadcasts, in contrast to those of "Free Romania," did not belong, directly, to what we call Romanian emigre propaganda. However, the activity of this group and the content of many of its broadcasts, especially when they rebroadcast material from the Romanian

Resistance, directly contributed to the popularization of the great themes of anti-Hitler propaganda within the country and aborad.

An important aspect--which has not been studied sufficient--of the activity of Romanian emigres in different countries was that of informing public opinion and political governmental circles in the countries of the anti-Hitler coalition of the real vital goals of the Romanian people, of the reasons for the unnatural presence of Romania on the German side in the war and winning and developing sympathy for the cause of the Romanian people. In this regard, both the public propaganda action and the actions undertaken directly in leadership circles of the respective countries were important. Of special importance in this regard was the clear and firm formulation by the Romanian Communist emigre community in the USSR, by other anti-fascist Romanians present there, and by a broad movement of Romanian prisoners of the fundamental interests and objectives of the Romanian people. The fundamental interests of Romania were consistently upheld by cadres of the Romanian Communist Party through the contacts which they had with various activists and leadership cadres of the CPSU and the Soviet state. For example, having in mind the venting, by different circles, of some so-called "solutions" for the "Transylvanian problem" contravening the national interests of Romania and the utilization in support of these "solutions" of the argument of the participation of the Antonescu regime in the anti-Soviet war, the militant Communist Valter Roman, who was directly responsible for the "Free Romania" radio station in Moscow, wrote a letter, on 24 July 1944, to M. M. Litvinov, assistant People's Commisar for Foreign Affairs, expressing the viewpoint of the RCP, stressing that it was "the only just one, in accordance with historic truth." Combatting arguments such as the one mentioned above, he said in his letter that "in addition to these 'solutions' which do not resolve the problem, there is, naturally, the viewpoint maintained by the Romanian Communist Party, for which the 'Free Romania' radio station has fought during the entire time of the war--namely, the solution of the problem of Transylvania means the abrogation of the 'arbitration' of Vienna (August 1940) and the reintegration of Northern Transylvania in Romania."

"Many arguments can be invoked in favor of this thesis but the most important one, it seems to me, is the argument of history. Transylvania belongs to Romania since the majority of the population of this historic region has been and is Romania, since the Romanian people have struggled for centuries for the unification of Transylvania with Romania, a unification which was achieved in December 1918. These are realities which, if they are not taken into consideration, can only complicate the evolution of things (including the final phase of the war), and the future establishment of peace in this corner of Europe. The participation of Romania in the aggression against the Soviet Union is an incontestable fact but it would not be rational nor just to make an entire people suffer for this."

LAW ON MILITARY SERVICE REQUIREMENT

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 36, 27 Jun 80 pp 1169-1182

[Law adopted by the SFRY Assembly in a session of the Federal Chamber on 26 June 1980]

[Text] I. General Provisions

Article 1

The military service requirement is an integral part of the rights and duties of citizens of the Socialist Federal Republic of Yugoslavia (hereafter referred to as "the SFRY") to defend the country and to preserve its freedom, independence, sovereignty and territorial integrity and the social system of the SFRY as established in the SFRY Constitution.

In fulfillment of their military service requirement SFRY citizens prepare, train and organize for conducting armed combat, for performing other duties in the armed forces of the SFRY (hereafter referred to as "the armed forces") and for participation in other forms of nationwide resistance to an enemy in case of aggression or other danger to the country.

Article 2

The military service requirement shall be fulfilled in peacetime and in wartime by all able-bodied citizens of the SFRY under the conditions prescribed by this law. Organizations of associated labor, local communities, other self-managed organizations and communities, sociopolitical and public organizations, and sociopolitical communities and their bodies and agencies shall be responsible and diligent about fulfillment of the military service requirement.

Article 3

Competent bodies and agencies in the republic or autonomous province, within the limits of their rights and duties as set forth in the constitution and law, shall organize and ensure fulfillment of the military service requirement in the jurisdiction of the respective sociopolitical community, shall

coordinate its performance with the exercise of other rights and fulfillment of other duties in the domain of nationwide defense and social self-protection and shall in that connection take the necessary steps and cooperate with the competent military authorities.

Aside from the functions referred to in Paragraph 1 of this article, the competent opstina agency shall keep military records on persons subject to military service and shall also perform other tasks related to the keeping of the military records prescribed by this law

Article 4

The competent authorities of the military district and other military authorities shall coordinate their plans for recruitment and for manning the armed forces with the competent authorities of the sociopolitical communities and shall collaborate with them in adopting and carrying out plans and measures and also in performing other functions and tasks related to fulfillment of the military service requirement.

The authority of the military district or other military authority designated by the federal secretary for national defense may communicate directly with the opstina agency competent for military service affairs for the sake of direct scrutiny of fulfillment of plans for recruitment and manning of the armed forces and other plans for performance of the military service requirement and also of performance of functions related to those plans.

Article 5

The military service requirement shall consist of the requirement of registration and recruitment, the requirement to serve the prescribed period of military service and the requirement to serve in the reserves.

Under the conditions set forth in this law the military service requirement shall also embrace the military training of women.

Under the conditions prescribed by this law all citizens of the SFRY are subject to the obligation of registration and recruitment, and citizens of the SFRY fit for military service are subject to the requirement of serving the prescribed period of military service and the requirement of serving in the reserves.

Article 6

Women shall not be subject to recruitment nor to the requirement of serving the prescribed period of military service.

In peacetime women who enroll voluntarily may be called up for military training in accordance with the needs of manning the armed forces, and

women who under the provisions of this law are subject to the military service requirement (hereafter referred to as "women subject to military service")--may be called up for military exercises in the armed forces in order to acquire the necessary military knowledge and to train for duties in wartime.

Article 7

An individual subject to the military service requirement shall be referred to as a person subject to military service (voini obveznik). During the life of the military service requirement the person subject to military service shall be one of the following:

1) registrant--during the time of the obligation of registration and recruitment;

2) serviceman--during the period of required military service or servicewoman--during voluntary military training in the armed forces;

3) reservist, reserve noncommissioned officer, reserve commissioned officer, or reserve military employee, and woman reservist, reserve noncommissioned woman officer, reserve commissioned woman officer or reserve woman military employee (hereafter referred to as "person in the reserves") during the life of the requirement to serve in the reserves of the armed forces.

For the purpose of this law the term "serviceman" covers both soldiers and sailors.

Article 8

The military service requirement shall terminate as follows:

1) when the person subject to military service reaches the age set by this law (Article 50);

2) if the person subject to military service is classified as unfit for military service;

3) if the person subject to military service ceases to be a citizen of the SFRY.

Article 9

A citizen of the SFRY whose military service requirement has terminated under the provision of Article 8, Subparagraph 2, of this law shall be subject to a review examination to check his fitness for military service.

The review examination referred to in Paragraph 1 of this article may be conducted if the citizen of the SFRY classified as unfit for military service has not reached age 50.

An individual as referred to in Paragraph 1 of this article who in the review examination is classified as fit for military service or fit for limited military service shall become a person subject to military service and shall be subject to the requirement of serving the prescribed period of military service to the end of the calendar year in which he reaches the age of 27, and if that calendar year has expired, he shall be subject to the obligation of serving in the reserves.

The decision on reserve examinations of all individuals born in one or more years may be taken by the Federal Executive Council, and the decision pertaining to individuals may be made by the federal secretary for national defense or officer whom he authorizes.

Article 10

The requirement to serve the prescribed period of military service shall be fulfilled in the Yugoslav People's Army, and the requirement to serve in the reserves shall be fulfilled in the Yugoslav People's Army and in territorial defense.

Article 11

A person subject to military service becomes a military person upon induction into a unit or institution of the armed forces (hereafter referred to as "military unit or military institution"), and ceases to be a military person upon discharge from the military unit or military institution. While fulfilling his military obligation on the summons of the competent authority the person subject to military service shall have the same status as a military person with respect to rights and duties, specifically as follows:

1) from departure from his residence to return to his residence in the place of his permanent residence or temporary residence if he has reported his temporary residence in the context of Article 74, Paragraph 2, of this law;

2) if he is residing abroad: on arrival--from the SFRY border to the place in which he is to report to the competent authority, and on his departure--from the place in which he has discharged the military obligation for which he was summoned to the border of the SFRY.

II. The Requirement of Registration and Recruitment

Article 12

The requirement of registration and recruitment consists of the duty to respond to a general or individual call and to carry out the enactments and orders of the competent bodies and agencies of sociopolitical communities, authorities of military districts and other military authorities and other government agencies in connection with enrollment in military records, medical and other examinations and tests, recruitment and induction to serve the prescribed military service.

The requirement of registration and recruitment commences at the beginning of the calendar year in which the citizen of the SFRY reaches age 17 and lasts until induction to serve prescribed military service or until the end of the calendar year in which he reaches age 27 or until termination of the military service requirement under the provisions of Article 8, Subparagraphs 2 or 3, of this law.

Article 13

So long as the requirement of registration and recruitment lasts, the registrant is subject to the following:

1) medical and other examinations and psychological tests to ascertain his fitness for military service;

2) recruitment;

3) induction for prescribed military service;

4) other obligations prescribed by this law.

Article 14

The examinations and tests referred to in Article 13, Subparagraph 1, of this law must be performed at the request of the competent agency of the sociopolitical community or authority of the military district by military medical institutions and organizations of associated labor in the health field. Mutual rights and obligations related to the performance of these examinations and tests shall be set forth in a contract.

Article 15

Recruitment shall take place in the calendar year in which the registrant reaches age 18.

At his request the registrant may be recruited in the calendar year in which he reaches age 17.

In case of an immediate danger of war or state of war, the SFRJ State Presidency may order registration and recruitment of persons who have reached age 16.

Article 16

Recruitment shall be done by recruitment commissions.

Recruitment commissions shall be established by the competent authorities of military districts.

The recruitment commission shall be made up of designated military personnel and civilians, one member of which must be a representative of the assembly of the sociopolitical community and another member a physician. Other persons may also be members of the recruitment commission if it is so provided by enactment of the republic or autonomous province.

The chairman of the recruitment commission shall be a member of the military.

Administrative and technical and other preparations related to recruitment and the necessary space for this purpose shall be provided for by the competent agency of the sociopolitical community, and if recruitment is taking place in a military institution--by the authority of the military district as well.

Article 17

During recruitment the registrant's fitness for military service shall be evaluated and the arm or service in which he is to do the prescribed period of military service shall be assigned.

The recruitment commission shall enter its evaluation of the registrant's fitness for military service and the arm or service assigned him in his military book.

Article 18

The recruitment commission shall evaluate the fitness of each registrant for military service on the basis of the findings of medical and other examinations and psychological tests performed previously in military medical institutions or in organizations of associated labor in the health field and on the basis of the medical examination performed at the time of recruitment.

The recruitment commission shall assign one of the following classifications:

1) fit for military service;

2) fit for limited military service;

3) temporarily unfit for military service;

4) unfit for military service.

Article 19

The arm or service assigned at the time of recruitment may in exceptional cases be altered by the recruitment commission on the following grounds: replenishment of the Yugoslav People's Army, a change in the registrant's state of health, specialized training acquired subsequently or a change in his occupation.

Article 20

A registrant found temporarily unfit for military service shall be subject to subsequent recruitment until the end of the calendar year in which he reaches age 26.

In each recruitment temporary unfitness may be assigned to last from 1 to 4 years, provided that the time of temporary unfitness does not extend beyond the end of the calendar year in which the registrant reaches age 26.

The recruitment commission shall fix the duration of the registrant's temporary unfitness and the time of his next recruitment.

A registrant may be classified as temporarily unfit for military service only twice. At the time of the third recruitment, the recruitment commission shall assign a final classification concerning his fitness for military service.

A registrant may not be classified temporarily unfit for military service in the calendar year in which he reaches age 26.

Article 21

The Federal Executive Council shall issue regulations on standards pertaining to evaluation of the medical fitness for military service of persons subject to military service.

The federal secretary for national defense is hereby authorized to issue the following regulations: on medical and other examinations and tests of persons subject to military service in order to ascertain fitness for military service and regulations on establishment and proceedings of recruitment commissions and on conditions for assignment of arms and services in which registrants shall do their prescribed military service.

III. Requirement To Do the Prescribed Period of Military Service

Article 22

The prescribed period of military service shall be 15 months.

As an exception to the provision of Paragraph 1 of this article, the prescribed period of military service for a sole breadwinner of a family shall be 12 months.

Article 23

For the purpose of this law "sole breadwinner of a family" means a registrant or serviceman whose family of which he is a member and with which he lives in the same household or which he is required to maintain has no other member capable of gainful employment and whose income from agriculture or other income does not exceed the amount fixed by the Federal Executive Council.

The following are regarded as members of the family as referred to in Paragraph 1 of this article: spouse, children (legitimate and illegitimate, adopted children, stepchildren, and orphans whose support has been undertaken), parents (father, mother, stepfather, stepmother), adoptive parent, grandfather, grandmother, great-grandfather and great-grandmother and brothers and sisters of the registrant or serviceman.

Members of the registrant's or serviceman's family shall be regarded as unfit for gainful employment if at the time when the application is submitted and the decision made on the application or recognition of the status of sole breadwinner of a family:

1) they had not reached age 18 or had reached age 18 but were attending school regularly, as follows: up to age 20--if they are attending schools for secondary vocational education or up to age 21--if they are attending a secondary maritime school, and up to age 23 if they are attending a junior postsecondary school, or up to age 25 if they are attending a university school or other senior postsecondary school;

2) male members of the family older than age 60, female members of the family older than age 55, and younger members of the family if they have been declared unfit for gainful employment permanently or for more than 2 years;

3) mother--if she has one or more children under age 7, or another member of the family keeping and raising such child if it does not have a mother or if its mother does not live in the same household.

Changes in the household of the family referred to in Paragraph 1 of this article which have occurred through the alienation of property and whereby conditions obtain for recognition of the status of sole breadwinner of the

family shall be taken into account if they took place 1 year before the registrant was called up to serve the prescribed military service.

Article 24

Upon induction to serve in a unit or institution of the Yugoslav People's Army the registrant becomes a serviceman, and he serves the prescribed period of military service from that date.

Article 25

Registrants classified as fit for military service or fit for limited military service shall as a rule be inducted in the year in which they reach age 19. A registrant who in that year does not graduate from a secondary vocational school or other secondary school which he is attending shall be inducted when he completes that school, but no later than the end of the calendar year in which he reaches age 21.

A registrant who is enrolled at the university or another senior or junior postsecondary school in the SFRY shall be inducted in the calendar year in which he finished the secondary vocational school or other secondary school if he has reached age 18.

The registrant referred to in Paragraph 2 of this article shall be inducted to serve his prescribed period of military service in two parts, as follows: the first part of the prescribed period, lasting 12 months, in the month of October after he has graduated from secondary school, and for the second part of the required service, lasting 6 months, after he has graduated from the university or other junior or senior postsecondary school or after he has ceased to be a student, but no later than the end of the calendar year in which he reaches age 26. A postsecondary student who by the end of the calendar year in which he reaches age 23 has not passed all the examinations prescribed for the first 2 years at the university or other junior or senior postsecondary school in which he continued studies after serving the first part of his military service shall also be inducted to serve the second portion of his military service.

A registrant who is enrolled at the university or other junior or senior postsecondary school and who has not been inducted for military service under the provisions of Paragraph 3 of this article because he had not reached age 18 shall be inducted to serve the first part of his prescribed service in the month of October of the next calendar year.

A registrant who himself requests to be inducted to do his military service or to complete his military service shall be inducted within 3 months from the date when he so requests, if in that year he reaches age 18.

A registrant who returns to the country after having been granted permission for temporary residence abroad lasting longer than 1 year and

requesting to be inducted to serve his prescribed military service shall be inducted within 30 days from the date when he files application if he reaches age 18 in that year.

During a state of war or in case of an immediate danger of war the SFRY State Presidency may order that registrants who have reached age 18 also be inducted to do the prescribed period of military service.

Article 26

A registrant may be inducted to serve the prescribed period of military service up until the end of the calendar year in which he reaches age 27.

A registrant who has not been inducted by the end of the calendar year in which he reaches age 27 and who is classified fit for military service or fit for limited military service shall be transferred to the reserves.

Article 27

Registrants who have the appropriate schooling and who meet the other conditions prescribed for selection of cadets for reserve officers' schools may serve their period of prescribed military service in a reserve officers' school of an arm or service if they have been found fit for military service and in a reserve officers' school of a service if they have been classified fit for limited military service.

The nomination of registrants for cadets of reserve officers' schools shall be made by the competent body or agency of the sociopolitical community, and the registrants shall be chosen by a commission established by the competent authority of the military district or other military authority designated by the federal secretary for national defense.

As an exception to the provision of Paragraph 2 of this article, a serviceman may be assigned to serve the remainder of his required military service in a reserve officers' school on recommendation of a regimental commander or equivalent or higher officer, if the serviceman fulfills the conditions stated in Paragraph 1 of this article.

The federal secretary for national defense is hereby authorized to issue regulations on qualifying conditions and procedure for selection of cadets of reserve officers' schools from among registrants.

Article 28

The federal secretary for national defense shall make the decision on acceptance for induction of a citizen of the SFRY who resides abroad permanently and has applied to do his military service.

Article 29

The following shall not be inducted to do military service:

1) a registrant convicted under a final verdict to a reformatory sentence or sentenced without suspension to a prison sentence for a crime--until he has served the sentence or been paroled;

2) a registrant against whom an institutional reformatory measure or preventive measure of psychiatric treatment and commitment in a medical institution has been invoked--so long as the measure invoked shall last;

3) a registrant against whom criminal proceedings have been instituted for a crime automatically prosecuted--until proceedings have been terminated under a final decision.

Registrants who on the grounds enumerated in Paragraph 1 of this article are not inducted to do military service shall be inducted to serve or complete their period of military service after serving their sentence, after parole, after the reformatory measure or preventive measure has been withdrawn, or after criminal proceedings have been finally terminated, but no later than the end of the calendar year in which they reach age 27.

Persons given a reformatory sentence or unsuspended prison sentence for a crime may in time of war or in a case of immediate danger of war be inducted to do military service if the serving of their sentence has been postponed.

Article 30

The following are exempted from the requirement to do military service:

1) a person classified unfit for military service;

2) a person who acquires citizenship in the SFRY by naturalization or on the basis of international treaties if in the country of which he was a citizen he has done his military service or if he has reached age 27;

3) a person who has acquired the status of active military personnel under the service regulations in the armed forces;

4) a person who has graduated from a law enforcement school lasting at least 2 years and has been a policeman for at least 3 years.

Article 31

Military service shall be postponed at the registrant's request as follows:

1) for the sole breadwinner of a family--so long as he is the sole breadwinner, but no later than the end of November of the calendar year in which he reaches age 27;

2) for half, or a bare majority if their number is odd, of registrants who are members of a single household if one or more members of that household are being inducted or are already doing military service--until that member or the other half of the members of that household complete their military service or are discharged for other reasons from the Yugoslav People's Army, but no later than the end of November of the calendar year in which they reach age 27;

3) if because of death or serious illness in the family or because of a natural disaster the registrant's family would suffer hardship because of his induction to do military service--so long as such grounds exist, but no longer than 1 year.

The military service of the registrant referred to in Paragraph 1, Subparagraphs 1 and 2, of this article shall be postponed until the next year if the application for postponement of military service and the necessary evidence are submitted to the competent agency of the sociopolitical community within a period of 8 days from the date of receipt of the notice or summons for induction to do military service.

A registrant who under the provisions of this law exercises the right to postpone his military service must inform the competent agency of the sociopolitical community of a change occurring causing him to lose that right within 8 days from the date when such change occurred.

Article 32

As an exception and at the registrant's request military service may be postponed a maximum of 1 year for warranted family or other reasons in accordance with regulations issued by the federal secretary for national defense.

Article 33

A serviceman's military service shall be interrupted in the following cases:

1) if the serviceman has been inducted to do his military service in two parts (Article 25, Paragraphs 2-4)--when he has served 12 months, unless no later than 30 days before expiration of his period of service he declares his desire to serve his period of military service without interruption;

2) if while doing his military service a serviceman is classified temporarily unfit for military service;

3) if while doing his military service a serviceman has been convicted by a military court and sentenced under a final verdict to a reformatory or unsuspended prison sentence--until he serves the sentence or is paroled;

4) if while doing his military service the serviceman has been convicted by another court and under a final verdict given an unsuspended prison sentence of more than 6 months or a reformatory sentence--until he serves the sentence or is paroled;

5) if criminal proceedings are instituted against a serviceman while doing his military service for a crime automatically prosecuted which was committed before his induction, if the sentence envisaged for that crime is more than 3 years.

As an exception to the provision of Paragraph 1, Subparagraph 4, of this article, military service shall not be interrupted if a serviceman has been convicted under a final verdict to a reformatory sentence of less than 2 years or unsuspended prison sentence of less than 2 years if more than 6 months remain to the end of his period of military service.

Article 34

A serviceman's military service may be interrupted at his request because of death or serious illness in the family or because of a natural disaster if his absence could cause hardship for his family--so long as those grounds exist, but no longer than 1 year.

Article 35

The military service of a serviceman classified as temporarily unfit for military service may be interrupted only once. A serviceman whose period of military service has had to be interrupted a second time because he has been classified temporarily unfit for military service shall be transferred to the reserves regardless of the time he has spent doing military service. Such individuals shall be subject to another medical examination to evaluate his fitness to serve in the reserves.

Article 36

An individual whose period of military service has been interrupted on the grounds enumerated in Article 33, Paragraph 1, Subparagraphs 2-5, or Article 34 of this law, and who has not met his military service requirement in the context of Article 37 of this law, again becomes a registrant and is subject to the obligations prescribed by this law for registrants.

A person whose period of military service has been interrupted on the grounds enumerated in Article 33, Paragraph 1, Subparagraphs 3-5, of this law shall be inducted to serve the remainder of his period of military service during the year in which he was released or paroled from prison or in

which criminal proceedings were terminated by final court decision, but no later than the end of the calendar year in which he reaches age 27.

A person whose period of military service has been interrupted under the provision of Article 33, Paragraph 1, Subparagraph 1, of this law shall bear all the rights and duties of a person in the reserves until the date of his induction to serve the second portion of his period of military service.

Article 37

A person whose period of military service has been interrupted under Article 33, Paragraph 1, Subparagraph 2, or Article 34 of this law shall not be inducted to serve the remainder of his period of military service if less than 60 days of that period remains. This individual shall be transferred to the reserves as of the date when his period of military service is interrupted.

Article 38

A serviceman classified unfit for military service while doing his period of military service shall be discharged from the Yugoslav People's Army. This individual may be called up to serve the remainder of his military service or transferred to the reserves under the conditions prescribed by the provisions of Article 9 of this law.

Article 39

The time which a military school cadet spends in the military school shall be credited against his period of military service.

The first 2 years of schooling in a military school shall not be credited to the period of military service in the case of a military school cadet whose schooling has been interrupted regardless of the reason.

Article 40

The following time shall not be credited to a serviceman's period of military service:

1) time spent serving disciplinary measures in the guardhouse or time spent serving a prison sentence which the competent military officer, under the provisions concerning military discipline, has pronounced for a total length of more than 10 days;

2) time spent being treated or on sick leave for an injury or other disability caused with the intention of avoiding military service or of being assigned to an easier duty, if this has been established by a final verdict of a military court;

3) time spent absent without leave or in flight from the Yugoslav People's Army which has lasted at least 24 hours continuously;

4) time spent in custody when custody is ordered in criminal proceedings if the final verdict credits that time to the sentence pronounced for a crime.

Article 41

When an individual does his period of military service, he is discharged from the Yugoslav People's Army and becomes a reservist or, under the conditions prescribed by the law regulating service in the armed forces, a reserve noncommissioned officer or reserve commissioned officer.

A serviceman who at the end of his period of military service uses leave to which he is entitled or leave granted him shall be discharged as many days earlier from the Yugoslav People's Army as the length of the leave to which he is entitled or which he has been granted.

Article 42

If the interests of national defense and the combat readiness of the Yugoslav People's Army so allow, the period of military service referred to in Article 22 of this law may be shortened as much as 3 months.

The existence of the conditions stated in Paragraph 1 of this article, and also the ages and groups of servicemen to whom the provision of Paragraph 1 of this article shall be applied, shall be set forth by the SFRY State Presidency.

Under the conditions stated in Paragraph 1 of this article the federal secretary for national defense may as an exception order certain groups of servicemen to be discharged from their period of military service before expiration of the period of time stated in Article 22 of this law, but no earlier than 30 days before expiration of that period.

The individuals referred to in Paragraphs 1-3 of this article shall be transferred to the reserves as of the date of discharge from the Yugoslav People's Army.

The enactment shortening the period of military service or discharging certain groups of servicemen as referred to in Paragraphs 1-3 of this article may provide that servicemen who have reported late to do their military service without good cause or who during their period of military service were absent without leave from their unit or from the Yugoslav People's Army, if the lateness or absence without leave lasted at least 24 hours, shall not be discharged at the same time with other servicemen in that group.

Article 43

The federal secretary for national defense is hereby authorized to issue regulations on the following: the time and manner of induction of registrants to do their military service; the procedure for ascertaining the status of sole breadwinner of a family; postponement and interruption of the period of military service and the discharge of servicemen from the Yugoslav People's Army.

IV. Military Training of Women

Article 44

The military training of women who volunteer shall be organized and conducted in the Yugoslav People's Army and in territorial defense. This training may last from 2 months to 6 months, depending on the duties for which they are being trained.

A woman may be called up for the military training referred to in Paragraph 1 of this article in the calendar year in which she reaches age 19 and until the end of the calendar year in which she reaches age 27, if she is fit for military service.

Neither a pregnant woman nor a woman who has a child younger than age 7 shall be called up for military training.

A woman's fitness for military service shall be ascertained by a medical commission established by the competent agency in the republic or autonomous province according to the criteria set forth for evaluation of the fitness for military service of persons subject to military service.

Article 45

The military training of women shall be planned and organized in accordance with the needs of manning the armed forces and the capabilities of conducting that training in military units and military institutions.

The military training of women shall be organized and conducted for the sake of acquiring the necessary military knowledge and skills and to train them for their duties in the armed forces.

Article 46

A woman who has been inducted into a military unit or military institution for military training shall be regarded as a military person from the date of induction in that unit or institution until the date of discharge from the military unit or military institution, and during that time shall wear a military uniform, shall be subject to military discipline, and shall bear all the other rights and obligations prescribed for servicemen.

Article 47

A woman who has been called up for military training and who has been inducted into a military unit or military institution must undergo training and must spend in military training the time envisaged by the military training syllabus and program.

A woman who has begun military training may be released from that training because of illness or for other good cause.

Article 48

The Federal Executive Council shall issue regulations on evaluation of the fitness of women for military service.

The federal secretary for national defense is hereby authorized to issue regulations on the following: planning and organization military training of women; induction of women for military training and other matters important to the actual organization and conduct of this training.

V. Requirement To Serve in the Reserves

Article 49

The following persons subject to military service are subject to the requirement of serving in the reserves of the armed forces:

1) those who have done their military service;

2) those who under the provisions of this law have met the requirement of doing their military service in some other way;

3) women subject to military service.

All women subject to military service shall be subject to the requirement of serving in the reserves of territorial defense under conditions prescribed by this law, and women subject to military service who have training for performing specialized and technical duties in the Yugoslav People's Army and women subject to military service who have been trained in peacetime for wartime duties in the armed forces shall be subject to the requirement of serving in the reserves of the Yugoslav People's Army.

Article 50

For men the requirement of serving in the reserves commences as of the date of discharge from their period of prescribed military service or from the date when the requirement to do military service was met in some other way and shall last until the end of the calendar year in which the man subject to military service reaches age 60.

For women the requirement of serving in the reserves commences at the beginning of the calendar year in which they reach age 19 and lasts until the end of the calendar year in which they reach age 50.

In case of an immediate danger of war or during a state of war the SFRY State Presidency may extend the duration of the requirement of serving in the reserves for reserve officers and reserve military employees even beyond the ages prescribed under the provisions of Paragraphs 1 and 2 of this article.

Article 51

The requirement of serving in the reserves of the armed forces shall be met by the participation of reservists in military exercises, course and other forms of military training and by performance of other duties prescribed by this law, and in wartime or in case of an immediate danger of war or other danger to the country it shall be met by induction into the armed forces or by performance of specified military duties.

Military exercises, courses and other forms of military training which are regarded as military exercises (hereafter referred to as "military exercises") may not total more than the following: up to 6 months for reserve enlisted men, reserve noncommissioned officers and reserve military employees, up to 12 months for reserve commissioned officers, and up to 6 months for all women subject to military service.

Article 52

As a rule military exercises shall be organized and conducted in military units or military institutions.

The time which individuals in the reserves spend in courses and other forms of professional military training conducted in a program of the Federation of Reserve Military Officers and other organizations designated by the federal secretary for national defense shall be credited to performance of military exercises if such training has been planned, organized and overseen by an authority of the Yugoslav People's Army or territorial defense staff and if such training is conducted in response to a summons of the competent agency of the sociopolitical community.

Persons in the reserves must answer a call to attend training referred to in Paragraph 2 of this article.

The time which individuals in the reserves spend as training instructors for defense and protection shall be credited to performance of military exercises if remuneration is not received for that work.

Eight hours spent in a course or training as referred to in Paragraph 2 of this article or 8 hours of work as a training instructor for defense and

protection performed in the manner prescribed in Paragraph 4 of this article shall be counted as 1 day of military exercises.

The exercises of persons in the reserves whose wartime assignment is outside the armed forces shall be regarded as military exercises under the provisions of this law if those persons participate in exercises in the duties given them as a wartime assignment by the competent body of the sociopolitical community.

Article 53

Persons subject to military service who have done their military service and who have a wartime assignment in the police may be called up into police units for military exercises.

The official who heads the federal, republic or provincial agency competent for internal affairs shall call up the persons subject to military service referred to in Paragraph 1 of this article for military exercises in police units, shall rule on their applications for postponement of military exercises and shall decide other matters related to the conduct of such exercises.

Military exercises conducted in police units shall be equivalent under this law with military exercises in military units or military institutions.

Article 54

Male reservists may be called up for military exercises until they reach the age of 55, and women may be called up until they reach the age of 45.

As an exception to the provision of Paragraph 1 of this article, the following shall not be called up for military exercises: pregnant women, a woman whose spouse has been called up for military service; a widow, divorcee or unmarried woman who has a child younger than 15, and a woman whose spouse has not been called up for military service if she has a child younger than 10.

A reservist may be called up for military exercises lasting no more than 2 months during any one year.

When the interests of national defense so require, the SFRY State Presidency may order that the following be called up for military exercises:

1) reservists who have already completed military exercises amounting to the total prescribed by the provisions of Paragraph 3 of this article and Article 51, Paragraph 2, of this law;

2) reservists who have reached the ages prescribed in Paragraph 1 of this article.

When the interests of national defense so require, the SFRY State Presidency may order that reservists be detained for military exercises immediately after they have done their military service.

Article 55

A reservist's participation in military exercises shall be postponed at his request on the following grounds:

1) if he is ill--until the first callup following his recovery;

2) if two or more members of his household are being called up at the same time or if some of them are already on military exercises or doing their military service--until one member or the other half of the members of the household return from military exercises or from doing their military service;

3) if at the time of the callup for military exercises he is attending school and if leaving school for military exercises would prevent him from completing the academic year--until beginning of the school vacation;

4) if because of death or serious illness in the household or because of a natural disaster his departure for military exercises would represent a hardship for the household--so long as that condition prevails in the household, but no longer than 1 year;

5) if immediately before the departure or at the time of departure for military exercises a death has occurred in the household or in the family--until the next callup for military exercises.

Participation in military exercises may be postponed in exceptional cases because of official business which cannot be postponed if this is requested by the competent agency of a sociopolitical community or other government agency, organization of associated labor or other self-managed organization or community in which the reservist is employed--so long as such need exists, but no longer than 1 year.

Participation in a military exercise lasting longer than 3 days may in exceptional cases be postponed in the case of a farmer called up for military exercises because of farm work that cannot be postponed if there is no other member of his household capable of gainful employment--for no longer than 3 months.

An application for postponement of participation in a military exercise shall be filed with the competent body of the sociopolitical community within 8 days from the date of receipt of the summons to the military exercise, and if postponement is being sought on the grounds enumerated in Subparagraphs 1, 4 and 5 of Paragraph 1 of this article, the application may also be submitted upon occurrence of the reason why postponement of participation in the military exercise is being sought.

Article 56

According to the needs of manning the armed forces, reservists shall be given and notified of their wartime assignment in military units or military institutions.

Information concerning wartime assignment constitute a military secret.

Personal military equipment may be issued to a reservist given a particular wartime assignment according to the duty to which he has been assigned.

A person who in the context of the provision of Paragraph 3 of this article has been issued personal military equipment must receive, keep and maintain that equipment, must carry it with him when so ordered by a summons of the competent authority, and must return it in good condition at the request of the competent authority.

Article 57

A reservist whose state of health has changed so as to have an effect on his fitness for military service may at his request or on the summons of the competent agency of the sociopolitical community or authority of the military district or other military authority be sent for a medical examination and evaluation of his fitness for military service.

A military medical commission shall evaluate fitness for military service of the person referred to in Paragraph 1 of this article.

The fitness for military service of a woman subject to military service shall be ascertained at her request by the medical commission designated by the competent body in the republic or autonomous province.

Article 58

The federal secretary for national defense is hereby authorized to issue regulations on the following: the callup of reservists for military exercises and postponement of participation in military exercises; the organization of specialized training of reservists in organizations of the Federation of Reserve Military Officers and in other organizations; the manner in which the wartime assignment of persons subject to military service shall be determined; the issuance of personal military equipment to reservists, and the safekeeping, maintenance and return of such equipment.

VI. Foreign Travel and Residence of Persons Subject to Military Service

Article 59

A registrant who intends to travel abroad for temporary or permanent residence must obtain the permission of the competent agency of the sociopolitical community.

Permission for travel and temporary residence abroad may be issued to a registrant if he is traveling abroad for the following reasons:

1) for medical treatment--so long as such treatment lasts, but no longer than 2 years;

2) for participation in school excursions, for annual vacation, a tourist trip, etc.--up to 40 days;

3) to conduct official business, to participate in athletic competitions or cultural and artistic events, to settle property, family or other relations abroad, or in case of serious illness or death of a member of his immediate family abroad--up to 60 days;

4) to do his training cruise in the curriculum of a secondary maritime training school--until completion of his training time at sea;

5) to perform duties arising out of the employment relation on a vessel or aircraft of the SFRY traveling on international routes--up to 2 years;

6) to go abroad with his parents or spouse if they are going abroad officially or for employment, provided his induction to do military service is not scheduled within 1 year from the date when the application for permission is submitted--up to 4 years;

7) to conduct private or official business if at the time of recruitment he was classified temporarily unfit for military service for a period of 2 years or longer--until expiration of the time for which he was classified temporarily unfit for military service.

The agency referred to in Paragraph 1 of this article may not allow a registrant to travel or reside temporarily abroad for a period of time that would extend beyond the end of the month of June in the year in which the registrant reaches age 27.

Permission to travel for permanent residence abroad shall be issued to a registrant who is going abroad to reside there permanently.

A registrant who is residing abroad may be issued permission for temporary or permanent residence abroad or for extension of residence abroad under the conditions prescribed in Paragraphs 2 and 4 of this article and for other good cause (employment, family and other similar reasons).

A registrant as referred to in Paragraphs 2, 4 and 5 of this article shall not be issued permission to travel abroad if there exists any of the impediments prescribed in Article 61 of this law.

Article 60

Permission for residence or for extension of residence abroad under the provision of Article 59, Paragraph 5, of this law shall be issued to a resident residing abroad by the diplomatic or consular mission of the SFRY (hereafter referred to as the "diplomatic mission") where he is enrolled in military records.

Within 2 months from the date of issuing the permission referred to in Paragraph 1 of this article the diplomatic mission is required to notify the competent agency of the sociopolitical community concerning each registrant to which it has issued permission for residence or extension of residence abroad and the period of residence which it has permitted or extended.

Article 61

A reservist may travel abroad and reside abroad temporarily or permanently provided there are none of the following impediments:

1) if a callup for military service has been delivered to him;

2) if criminal proceedings have been instituted against him for the crime of not responding to a callup and evasion of military service or for the crime of evading military service by making himself unfit or by deception;

3) if he is a military specialist or has a wartime assignment as designated by the federal secretary for national defense.

The Federal Executive Council may prescribe conditions which would temporarily restrict foreign travel of persons subject to military service of particular ages or of a particular professional training which have especial importance to manning the armed forces.

If any of the reasons referred to in Paragraphs 1 and 2 of this article should prevail, it shall be assumed that in the context of regulations governing the issue of travel documents to citizens of the SFRY the interests of national defense require that a travel document not be issued to a reservist or the period of validity of a travel document not be extended or visa not be issued or that the travel document shall be withdrawn or visa canceled.

Article 62

A registrant or reservist who has traveled abroad for permanent residence or temporary residence longer than 1 year must report to the diplomatic mission for enrollment in the military records within the period specified in regulations on travel documents of citizens of the SFRY.

A resident residing abroad permanent or temporarily in the calendar year in which he reaches age 17 must during that calendar year report to the diplomatic mission to be enrolled in the military records.

Article 63

A registrant residing abroad temporarily must return to the SFRY before expiration of the period for which temporary foreign residence has been granted him, and within a period of 8 days from arrival in the SFRY he is required to report to the competent agency of the sociopolitical community for recruitment or induction to do military service.

Article 64

A registrant returning from approved temporary residence abroad to the SFRY for a visit lasting longer than 3 months shall be inducted to do military service if in recruitment he has been classified fit for military service or fit for limited military service.

A registrant who following approved permanent residence abroad returns to the SFRY for a visit lasting longer than 1 year shall be inducted to do military service if in recruitment he is classified fit for military service or fit for limited military service.

As an exception to Paragraph 2 of this article a registrant returning after approved permanent residence abroad to reside in the SFRY to go to school shall not be inducted to do his military service so long as his schooling lasts.

Article 65

Foreign travel and foreign residence of servicemen and reservists while serving in the armed forces shall be regulated by regulations governing service in the armed forces.

Article 66

A reservist may not enter into the service of foreign armed forces or establish any relationship whatsoever with those forces without prior permission of the competent agency in the republic or autonomous province.

VII. Callup of Persons Subject to Military Service and the Keeping of Records on Such Persons

Article 67

A person subject to military service which the competent agency calls up to fulfill a military requirement must report to the respective agency at the place and time indicated in the individual or general callup and bring with him the things and documents specified in the callup notice.

The individual callup notice, except callup notices for mobilization or trial mobilization, shall be delivered to the person subject to military service no later than 30 days before the day fixed for commencement of fulfillment of the requirement specified in the notice.

If the person subject to military service does not respond to the notice and does not justify his absence, the authority which summoned him may issue an order for him to be brought in by force. The order to bring him in by force shall be carried out by the authorized law enforcement agencies or authorized military agencies.

Article 68

The person responsible in an agency of a sociopolitical community or other government agency, organization of associated labor or other self-managed organization or community in which the person subject to military service is employed is required to immediately report his evasion of fulfillment of his military service requirement to the competent agency of the sociopolitical community.

A workingman who is self-employed (independently performs an activity by his own work with privately owned assets) must immediately report evasion of fulfillment of the military service requirement by a person subject to military service who is employed by him to the competent agency of the sociopolitical community.

Article 69

An individual who has been called up to fulfill a military obligation is entitled to be reimbursed for his traveling expenses by public transport, to be housed and to be fed.

The reimbursement referred to in Paragraph 1 of this article shall be paid to individuals called up to fulfill a military service requirement in the Yugoslav People's Army under the financial plan of the Federal Secretariat for National Defense, and to persons called up to fulfill a military obligation in territorial defense--from the resources of the authority which called him up.

The conditions for payment of the reimbursement referred to in Paragraph 1 of this article to persons called up to fulfill a military obligation in the Yugoslav People's Army and the amount of that reimbursement shall be set forth in a regulation of the federal secretary for national defense, and with respect to persons called up to fulfill a military obligation in territorial defense--by a regulation of the competent authority in the republic or autonomous province.

Article 70

A registrant or reservist who is employed and who has been called up to fulfill a military obligation shall be entitled to compensation for the time of fulfillment of that obligation in the amount of the average monthly personal income which he earned over the 3 months prior to being called up.

A registrant or reservist who is a delegate in the assembly of a sociopolitical community or the assembly of a self-managed special-interest community, who holds a permanent position or has been delegated or appointed to a permanent position in a sociopolitical or public organization, if he earns personal income on that basis, shall be afforded the same status as a registrant or reservist who is employed with respect to the right to compensation of personal income for the time of performance of the military obligation for which he was called up.

A registrant or reservist who independently performs an activity by his own labor and with privately owned assets or is self-employed in another profession shall be entitled to money compensation for the time spent fulfilling the military obligation in the amount of the base on which he pays the contribution for old-age and disability insurance.

A registrant or reservist who qualifies for a pension or is receiving money compensation because of temporary unemployment shall be entitled to the pension or money compensation during the time he is fulfilling the military obligation for which he was called up.

A registrant or reservist who is not employed, who does not independently perform an activity with his own labor and privately owned assets, and does not practice another profession, and a registrant and reservist who does not qualify for a pension or money compensation because of temporary employment, shall be entitled to money compensation in the amount prescribed by the Federal Executive Council for the time spent fulfilling the military obligation for which he was called up.

The registrant and reservist referred to in Paragraphs 1, 2 and 4 of this article whose reimbursement of personal income or whose pension or money compensation for temporary unemployment is less than the compensation referred to in Paragraph 5 of this article, shall be entitled to the difference between the amount of the reimbursement of personal income, the pension or the money compensation for temporary unemployment and the amount of the compensation referred to in Paragraph 5 of this article.

A reservist shall also be entitled to pay and supplements according to his rank or class during the time of military service. If that person's personal income, pension or the like is greater than the pay for the rank or class, he shall be entitled to the difference between the amount of pay and the amount of the personal income, pension or the like.

The compensation envisaged by the provisions of this article shall be paid to persons called up to fulfill a military obligation in the Yugoslav People's Army under the financial plan of the Federal Secretariat for National Defense, and to persons called up to fulfill a military obligation in territorial defense, it shall be paid from the resources of the authority which called him up.

A reservist called up for a military exercise conducted during his daily or weekly period of rest or on days when that individual does not work shall not be entitled to the compensation envisaged by the provisions of this article. If the military exercise lasts longer than 8 hours, he shall be entitled to free meals for that time.

A reservist may not be called up for military exercises conducted under the conditions referred to in Paragraph 9 of this article for more than 60 hours in any one year.

The manner of payment of compensation to reservists for time spent fulfilling a military obligation for which they were called up in territorial defense shall be defined by a regulation of the competent authority in the republic or autonomous province.

Article 71

Military records shall be kept on persons subject to military service.

Military records on all persons subject to military service shall be kept by the agency referred to in Article 3, Paragraph 2, of this law, and military records on reserve officers and reserve military employees shall be kept by the competent authority of the military district. Persons subject to military service shall be kept in military records according to their domicile, and persons subject to military service who are employed for an indefinite period in another republic or autonomous province where they do not have domicile--according to the place where they are employed.

Military records on persons subject to military service residing abroad more than 1 year shall also be kept by the competent diplomatic missions.

Persons subject to military service shall be entered in military records at the beginning of the year in which the obligation of registration and recruitment comes about.

Women subject to military service assigned to the reserves of the Yugoslav People's Army and women who have volunteered for military training shall be kept in the military records according to regulations issued by the federal secretary for national defense, and other women subject to military service shall be kept in the military records according to the regulations of the competent authority in the republic or autonomous province.

Organizations of associated labor and other self-managed organizations and communities, agencies of sociopolitical communities and other government agencies shall keep certain data on persons subject to military service employed in those organizations or agencies according to the regulations of the competent authority in the republic or autonomous province.

Article 72

Agencies of sociopolitical communities, other government agencies, organizations of associated labor and other self-managed organizations and communities are required to furnish the agency referred to in Article 3, Paragraph 2, of this law, at its request, the necessary data concerning persons subject to military service for purposes of evaluation of fitness for military service and for assignment of arm, service or individual duties in the armed forces.

Article 73

A military book shall be issued to persons subject to military service who are kept in military records.

The military book shall be a personal public document whereby a person subject to military service proves that he has fulfilled his military service requirement and proves his identity while in military service.

The military book shall be issued by the competent agency of the sociopolitical community where the person subject to military service is registered.

As an exception to the provision of Paragraph 3 of this article, the military book shall be issued by the following:

1) by the military school--to cadets who previously have not been issued a military book and to cadets who have lost their military book or in some other manner have been left without it;

2) by the unit or institution of the Yugoslav People's Army at the rank of an independent battalion, regiment or higher--to persons whose active military service is terminating and to servicemen who while doing their military service lose their military book or in some other manner are left without it.

Persons subject to military service are responsible for the safekeeping of their military book. If their wartime assignment has been entered in the military book, it constitutes a military secret.

It is prohibited to carry a military book out of the SFRY.

A person subject to military service who is traveling abroad for a stay longer than 1 year is required before his departure abroad to turn his

military book in to the competent agency of the sociopolitical community where he is registered in military records.

Article 74

A registrant or reservist is required to report any of the following changes to the competent agency of the sociopolitical community where he is registered in military records within 8 days of the date when the change occurred: an obvious change in state of health that has a bearing on fitness for military service; educational and professional qualifications acquired; establishment and termination of the employment relations; the type and place of performance of an independent activity by their personal labor with privately owned assets or practice of other profession; change of address; change of domicile; return from doing military service and loss of military book.

The persons referred to in Paragraph 1 of this article are required to report a stay abroad longer than 40 days and a temporary absence from the domicile longer than 40 days--within a period of 8 days before departure, and return from abroad or to his domicile--within a period of 8 days from the date of arrival at the domicile.

In addition to the changes set forth in Paragraphs 1 and 2 of this article, women subject to military service who are registered in military records are required to report changes in family life which have a bearing on performance of their military obligation (marriage, pregnancy, birth of a child, divorce, death in the family).

The changes set forth in Paragraphs 1-3 of this article must be reported by registrants and reservists or women subject to military service who are employed in agencies of sociopolitical communities or in other government agencies, organizations of associated labor or other self-managed organizations and communities in which there is a service or person handling the affairs of national defense to that service or person. That service or person shall within 8 days of the date of the notified change so inform the competent agency of the sociopolitical community with which the registrant or reservist is registered in military records.

Article 75

Changes affecting a person subject to military service which occur by decision of a competent body or agency must be reported by that body or agency to the competent agency of the sociopolitical community with which the person subject to military service is registered in military records within 15 days from the date when the change occurred, as follows:

1) a change of the person's name or termination of citizenship of the SFRY--by the body or agency which issued the final decision;

2) the institution, stay or suspension of criminal proceedings for a crime automatically prosecuted, a reformatory sentence or unsuspended prison sentence for a crime under a final verdict, an institutional reformatory measure under a final pronouncement or precautionary measures of mandatory psychiatric treatment and commitment in a health organization and mandatory treatment of alcoholics and drug addicts in a health or other specialized organization, and commitment to serve a reformatory or prison sentence--by the competent court;

3) a prison sentence pronounced on a registrant for a misdemeanor--by the agency which pronounced the sentence;

4) release from serving a prison sentence or reformatory sentence--by the agency or institution which released the person subject to military service following service of the sentence.

Notice that a person subject to military service has gone abroad for employment must be delivered in the context of Paragraph 1 of this article by the self-managed special-interest community for employment security which acted as intermediary in obtaining foreign employment for the person subject to military service.

The death of a person subject to military service or proclamation of the death of a missing person subject to military service must be reported in the context of Paragraph 1 of this article by the registrar who made the entry to that effect in the death records.

The absence of a registrant or reservist from his domicile or residence for unknown causes and lasting more than 15 days shall be reported by a member of the family with which he lived in the same household, and if he lived separately from his family, but was employed--by the responsible person in the agency of the sociopolitical community or other government agency, organization of associated labor or other self-managed organization or community who keeps records on employed persons, or by a workingman who independently performs an activity by his own labor and with privately owned assets by whom the absent person subject to military service was employed. The notice of the absence of a person subject to military service for unknown causes must be filed by such persons within 8 days following passage of the 15th day from the date of his absence.

Article 76

The federal secretary for national defense is hereby authorized to issue regulations on the following: the callup of persons subject to military service to perform military obligations; the manner in which compensation shall be paid to persons subject to military service called up to perform a military obligation in the Yugoslav People's Army and the keeping of military records on persons subject to military service.

VIII. Procedure

Article 77

The decisions related to fulfillment of a military obligation shall be made by the competent agency of the sociopolitical community unless this law provides otherwise.

The commanding officer of an independent battalion, a regimental commander, or officer occupying equivalent or higher position shall pronounce decisions related to fulfillment of the requirement to do prescribed military service of a serviceman in a military unit or military institution under his command or administration, except decisions which apply to establishing the status of sole breadwinner of a family.

An appeal of a decision pronounced in connection with performance of a military obligation shall not stay execution of that decision.

An appeal against a decision of a recruiting commission shall be ruled on by the commanding officer of the authority of the military district which established that commission.

Article 78

Fees may not be introduced nor collected for rulings and other decisions, confirmations and other documents, for applications, appeals and other petitions nor appendices to such documents or petitions related to fulfillment of a military obligation or pertaining to such obligation.

IX. Punitive Provisions

Article 79

A registrant or reservist shall be liable to a fine of no less than 1,500 and no more than 5,000 dinars or a prison sentence not to exceed 30 days for a misdemeanor if without good cause he does not answer the summons of a competent authority at the time and place indicated in the individual or general callup notice--for registration in military records, recruitment, medical and other examinations and tests prescribed by the Federal Secretariat for National Defense and for induction, military exercises or professional military training conducted in organizations of the Federation of Reserve Military Officers and other organizations and certified as performance of military exercises in the context of Article 52 of this law, or for issuance or return of personal military equipment or for other military service.

A person subject to military service shall also be liable to the punishment stated in Paragraph 1 of this article for a misdemeanor if after responding to a callup, he leaves without authorization a military exercise or professional military training which is certified in the context of Article 52 of

this law as performance of military exercises or other military service, or if he does not receive or does not return in good condition or does not keep and maintain in the prescribed manner personal military equipment as referred to in Article 56, Paragraphs 3 and 4, of this law or does not carry such equipment with him when ordered by the callup of the competent authority.

Article 80

A registrant or reservist shall be liable to a fine of no less than 800 and no more than 3,000 dinars or a prison sentence not to exceed 15 days for a misdemeanor in the following cases:

1) if within the prescribed period he does not notify the competent authority of the sociopolitical community where he is registered in military records of changes occurring as referred to in Article 31, Paragraph 3, and Article 74, Paragraphs 1-3, of this law;

2) if within the period prescribed in Articles 62 and 63 of this law he does not report to the diplomatic mission or competent agency of the sociopolitical community;

3) if he carries his military book from the SFRY (Article 73, Paragraph 6) or does not turn it over to the competent agency of the sociopolitical community before departing abroad for a stay longer than 1 year (Article 73, Paragraph 7).

A registrant or reservist who has committed a misdemeanor as referred to in Paragraph 1, Subparagraphs 1 or 2, of this article shall be liable to a prison sentence not to exceed 30 days if because of the failure to report in the context of Article 31, Paragraph 3, Articles 62 and 63, and Article 74, Paragraphs 1-3, of this law it was not possible to deliver to him in good time a callup for military service or if for that reason he was unable to report on time for military service.

Article 81

A self-managed special-interest community for employment security which acted as intermediary in obtaining foreign employment for a person subject to military service shall be subject to a fine of no less than 15,000 and no more than 30,000 dinars if it does not inform or is late in informing the competent agency of the sociopolitical community concerning departure of a person subject to military service to work abroad (Article 75, Paragraph 2).

The person responsible in the agency of a sociopolitical community or other government agency or in a self-managed special-interest community for employment security shall be subject to a fine of no less than 1,500 and no more than 3,000 dinars for a misdemeanor if that agency or community does

not inform or is late in informing the competent agency of the sociopolitical community concerning changes concerning a person subject to military service as referred to in Article 75, Paragraphs 1-3, of this law.

Article 82

An organization of associated labor or other self-managed organization or community shall be subject to a fine of no less than 15,000 and no more than 30,000 dinars for a misdemeanor in the following cases:

1) if it does not inform the competent agency of the sociopolitical community that a worker it employs is evading recruitment, induction or performance of other military service--as soon as it learns of the evasion (Article 68, Paragraph 1);

2) if within the prescribed period it does not notify the competent agency of the sociopolitical community of the absence for unknown causes of a person subject to military service who was employed by it (Article 75, Paragraph 4).

The person responsible in the agency of the sociopolitical community or other government agency, the organization of associated labor or other self-managed organization or community or other organization shall also be subject to a fine of no less than 1,500 and no more than 3,000 dinars for the misdemeanor referred to in Paragraph 1 of this article.

Article 83

A workingman who independently performs an activity with his own labor and privately owned assets shall be subject to a fine of no less than 5,000 and no more than 20,000 dinars for a misdemeanor in the following cases:

1) if he does not inform the competent agency of the sociopolitical community that a person subject to military service who is employed by him is evading performance of a military obligation (Article 68, Paragraph 2);

2) if within the prescribed period he does not notify the competent agency of the sociopolitical community of the absence for unknown causes of a person subject to military service who is employed by him (Article 75, Paragraph 4).

Article 84

The member of a family of a person subject to military service with whom he lives in the same household shall be subject to a fine of no less than 1,500 dinars for a misdemeanor if within the prescribed period he does not report to the competent agency of the sociopolitical community the absence of the person subject to military service for unknown causes (Article 75, Paragraph 4).

X. Transitional and Final Provisions

Article 85

A person subject to military service who before the date when this law takes effect was classified unfit for military service in peacetime or permanently unfit for military service shall be regarded as classified unfit for military service under the provisions of this law.

Article 86

A registrant who by the date when this law takes effect has graduated from a university school or other senior postsecondary or junior postsecondary school or who as of the date when this law takes effect is attending a university school or other senior postsecondary or junior postsecondary school and has reached the third level (postgraduate study) shall do his military service under the conditions prescribed by the provisions of Article 32, Paragraph 2, Subparagraph 1, and Article 36, Paragraph 1, Subparagraph 3, and Paragraphs 2 and 3, of the Law on the Military Service Requirement (SLUZBENI LIST SFRJ, No 22, 1974).

Article 87

A person who by the date when this law takes effect has graduated from a nationwide defense college or completed a nationwide defense program of study and in accordance with the curriculum and program of that college has served 4 months and 15 days as a military officer (training period) in the Yugoslav People's Army shall be regarded as having done his military service under the provisions of this law.

A person who as of the date when this law takes effect is a student of a nationwide defense college or course of study or of a security and social self-protection college shall be regarded as having done his military service under the provisions of this law if in accordance with the curriculum and program of the college in which he is studying he has spent 4 months and 15 days on duty (training) in the Yugoslav People's Army and if he has graduated from that college by the end of the calendar year in which he reaches age 26.

Article 88

Servicemen, except servicemen serving an 18-month period of military service, who as of the date when this law takes effect are doing their military service shall serve out their period of military service in accordance with the duration fixed under the provisions of Article 32, Paragraphs 1-2, of the Law on the Military Service Requirement (SLUZBENI LIST SFRJ, No 22, 1974).

Servicemen who as of the date when this law takes effect are doing an 18-month period of military service shall serve out a period of 15 months.

The servicemen referred to in Paragraph 2 of this article who as of the date when this law takes effect have done 15 or more months of military service shall be discharged from the Yugoslav People's Army within 8 days from the date when this law takes effect.

Article 89

A person whose military service has been interrupted in the sense of Articles 38-40 of the Law on the Military Service Requirement (SLUZBENI LIST SFRJ, No 22, 1974) before the date when this law takes effect and who has not fulfilled his obligation to do military service under Article 41 of that law shall be inducted to complete his period of military service under the provisions of this law (Articles 36-37) if that is more favorable to him.

Article 90

A person subject to military service who before the day when this law takes effect has not done his military service under the statutes in effect until that date shall be transferred to the reserves if the calendar year has expired in which he reached age 27 even though he is classified fit for military service or fit for limited military service.

A serviceman who under the statutes in effect up until the date when this law takes effect has been inducted to do military service after expiration of the calendar year in which he reached age 27 shall be discharged from the Yugoslav People's Army within 8 days from the date when this law takes effect.

Article 91

On the day when this law takes effect, the Law on the Military Service Requirement (SLUZBENI LIST SFRJ, No 22, 1974) shall cease to be valid.

Regulations issued on the basis of authorization contained in the Law on the Military Service Requirement (SLUZBENI LIST SFRJ, No 22, 1974) shall remain in effect until issuance of the regulations of the Federal Executive Council and federal secretary for national defense authorized by this law, but no later than 31 December 1981, except for provisions of those regulations which are not in conformity with this law.

Article 92

This law shall take effect on the eighth day after publication in SLUZBENI LIST SFRJ.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ROMANIA REPORTS GIEREK ILLNESS

AU061345

[Editorial Report] Bucharest Domestic Service in Romanian at 1900 GMT on 5 September carries a 6-minute report on Polish Premier Josef Pinkowski's speech to the SEJM session in Warsaw, as presented by PAP Newsagency. According to the report, Pinkowski said the current SEJM session "takes place in an atmosphere of complete lack of tension. The understanding reached with the strike committees was received in the country with a feeling of relief and with the hope that a solution can be found to the current socioeconomic situation." He then reported on current socio-economic concerns in Poland and dealt with wage increases for various categories of working people, with strict price controls to be applied by the government, improved supplies of consumer goods for the people, the need to increase efficiency in agriculture and industry and with the expansion of the housing construction program.

"Of key importance for our country's development, the head of the Polish Government said, devolves on expanding economic and scientific-technological cooperation with CEMA countries, particularly with the USSR. Life has again proved that we can always count on fraternal understanding and assistance. From these countries, primarily from the USSR, we import, under advantageous conditions, an important part of the fuel, raw and other materials used in the country." Premier Pinkowski also referred to the "important role devolving on trade unions within the socialist system" and stressed that "the government is ready to broadly cooperate with the trade unions. The conclusion drawn will contribute to creating conditions for developing workers self-management."

According to the report, the Polish premier then said: "We will develop, deepen and defend the alliance with the USSR and with other socialist countries as well as Poland's cooperation within CEMA and the Warsaw Pact as they are a priceless asset." He also dealt with tasks and organizational matters of the council of ministers.

"According to a medical communique issued by PAP, Edward Guerek, first secretary of the PZPR Central Committee, today suffered a serious heart malfunction. At the recommendation of a council of doctors, Edward Gierek was admitted to hospital, where he is under the careful observation of experts."

FRENCH JOURNALIST'S IMPRESSIONS OF COUNTRY PUBLISHED

AU071804 Tirana ZERI I POPULLIT in Albanian 28 Aug 80 p 4

[Ata Article: "Man at the Center of Everything"]

[Text] Prof Robert Escarpit, the renowned French writer and journalist who recently visited our country, has published an article on Albania in the form of a dialogue with journalist Jacques Ellul (Zhak Elyl) in the paper SUD-OUEST, in which, among other things, he says:

I remembered you, Jacques Ellul, I thought about both of us and our discussions at the moment when that man with the strong neck scorched face and black moustache said to me: "Here we put man at the center of everything."

"Here" was a deep valley in the highland region of Tropoje at the northern most tip of Albania where I was last week. The peasants who were sitting cross-legged on the carpet around the room where they meet, shook their heads, or to put it better, nodded them in an affirmative manner. Many of them were aged and had known the old times of the savage struggles against a harsh nature and against rapacious exploiters. All who were there remembered the arrival of electricity and the motorway a few years ago. The man who spoke, Jacques Ellul, was a militant communist who had once emphasized Marx's readings with the sound of the partisan's gun, and who marked them today with the continuous work of harvesting, irrigation and the construction of schools.

His statement did not amaze me. But you, Jacques? During these last months we have often had the same opinion concerning our biblical readings. I am curious to know whether or not we will again have the same opinion concerning our Marxist readings. I don't believe so, because there is a great difference between religion and revolution: One is a word, the other is a deed. It brought to mind Faust, who crossed out the phrase "in the beginning was the word" to write in its place "in the beginning was the deed."

When that Albanian peasant said that man is at the center of everything, he meant physically, with all his power, desires, body and soul, so that it would allow him to open a place there for the time of his life, and not to secure for himself, with a few metaphysical speeches, the useless eternity of an inalienable spirit. At the moment that I am writing these lines very few hours separate me from the moment when I departed from Albania, from the quiet roads of its cities where the lack of cars allows one to listen to the songs of birds and the rustling of the trees, from the majestic mountain scenery where each workable square meter is sown, and where fortifications are built. I don't know that there is a socialist paradise. The Albanians are for socialism, but I do not hink that they pretend to be in paradise. Yet, I know a few places where the faces are so calm, where the looks are so sure, where the gestures are so conscious as in Albania.

It is true that in Albania reality is not hidden. There is the dictatorship of the proletariat, there is communist leadership at all levels, but in contrast to what is happening in other countries, the apparatus never cancels the individual, the state power never eclipses him. Whether he is a worker at the base, a technical director or party cadre, the individual is really at the center of everything; he is there available to everyone, with a face and a name, with his own willpower, weaknesses, contradictions and especially his own personal responsibility. He speaks and others listen, just as he listens when others speak.

BRIEFS

DEATH OF ACADEMICIAN--Professor Kole Paparisto, Teacher of the People, a brilliant representative of Albanian education and science, died on 27 August 1980. He was a member of the Academy of Sciences, the chief of the flora sector in the Biological Research Center and the head of the department of botany in the Faculty of Natural Sciences in Tirana University. He became a member of the Albanian Communist Party in March 1943. He held important positions in the Ministry of Education and was chairman of the Institute of Sciences, assistant rector and professor of the University, and deputy from Elbasan District to a number of legislatures of the People's Assembly. ROLE OF GOOD ORGANIZATION, COMMUNICATIONS IN CIVIL DEFENSE OPERATIONS

Improving Management

Sofia GRAZHDANSKA OTBRANA in Bulgarian No 7, 1980 pp 2-6

[Article by Col Delcho Delchev]

[Text] The role of management in the building of a socialist society is rising steadily. That is why the party pays great attention to improving management in all the areas of the country's sociopolitical and national economic activities. This fully applies to management in the defense areas.

The capabilities of most modern armaments (operative-strategic missiles, nuclear missile submarines, nuclear airplanes, and others) enable them to inflict within a short time strikes of tremendous destructive power both in the theater of military operations as well as on targets in other continents. Hence the conclusion that the number and size of problems to be resolved by the Civil Defense under the conditions of an eventual nuclear missile war increase drastically. This, as well as the dynamic and fast nature of modern combat operations, determine the need to find ways and means for raising Civil Defense management to the level of modern requirements.

The essence of management of the Civil Defense system is expressed in the steady guidance provided by chiefs, staffs, and services to their subordinate units and forces in organizing their actions and directing their efforts toward the successful implementation of their assignments in both peace and wartime.

Most generally, management within the Civil Defense system includes the following:

- Maintaining the personnel of staffs, services, and formations in a high moral-political condition and promoting profound ideological convictions and constant readiness to carry out all measures and assignments;

- Advance planning of action by staffs, services, and formations going through various stages of readiness;

- Organizing the prompt availability of necessary data on the circumstances;

- Studying (analyzing) received data and making substantiated decisions without delay;

- Promptly formulating the tasks of subordinate organs and formations;

- Organizing and maintaining the uninterrupted interaction between one's own forces and facilities and those of the neighbors and the higher levels;

- Training the organs and formations to carry out the full range of assignments related to civil defense and rescue and emergency accident repair operations under complex circumstances; and

- Organizing and providing effective control and giving aid to subordinates in order to insure the timely, complete and qualitative implementation of assignments.

The specific nature of the organizational structures of the GO [Civil Defense] and its assignments in peace and wartime require knowledge and consideration of the characteristics of Civil Defense management. The management of GO organs and formations is an inseparable part of the overall command-organizational work related to the management of administrative-production activities in okrugs, sectors, obshtinas and national economy projects. The successful implementation of rescue and emergency accident repair operations is a basic prerequisite for the prompt resumption of production-economic activities in the stricken targets, needed for supporting the armed struggle and life of the population. That is why, starting with peacetime, the chiefs of GO and their staffs must train themselves for the simultaneous and interrelated solution of problems of national economic and defense importance. Engineer Yordan Rangelov, Civil Defense chief of the Vidin Obshtina, may be taken as an example of proper consideration and successful implementation of such tasks. Even though he is relatively new in this position, he has proved to be an authoritative and competent Civil Defense chief in the obshtina.

One of the characteristics of the command-management activities of Civil Defense chiefs and their staffs and services is the comprehensiveness of the required groups in charge of rescue and emergency accident repair operations. According to Ukase No 265, most Civil Defense formations must be created on the basis of work shifts in national economic projects. Hence the requirement of the multivariant nature of the groups which must operate under different circumstances. It would be difficult to predict the characteristics of such variations and to model them in peacetime. In the course of the operations, the GO chiefs and staffs must closely

follow and be always familiar with the situation and condition of their subordinate formations. They must display flexibility and high skills in maneuvering and in setting up the necessary groups for SNAVR [Rescue and Emergency Damage Repair Work] in accordance with the specific circumstances.

Another characteristic feature of Civil Defense management is the determination of the beginning of SNAVR. This problem neither could nor should be resolved automatically. According to the foreign press a concentrated nuclear strike from the air could last several hours. Under such circumstances should one wait for the end of the strike before determining the circumstances? Would it be risky to direct prematurely the formations to the stricken areas to help the victims? The adoption of a proper decision considering these two opposites is of exceptionally important moral-psychological significance.

The requirements facing Civil Defense management acquire new dimensions under the conditions of contemporary scientific and technical progress. According to a number of authors, in addition to the "classical" requirements of continuity, firmness, flexibility, resistance, reliability, and secrecy, today management must be even more operative and of higher quality.

Continuity of Civil Defense management is achieved mainly through prompt decision making and rapid information of subordinate organs and formations concerning their tasks; existence of stable and permanent contacts with subordinates and with neighbors and superiors; skillful deployment of management centers and insuring their reliable protection.

A particularly topical question under modern conditions is that of passing on (receiving) control from one center to another. From the viewpoint of management continuity, the practical solution of this problem calls for the formulation of an efficient system of views on management technology at the different Civil Defense units and levels.

The time has also come to set up mobile control centers for the various units within the Civil Defense system.

Management firmness in the Civil Defense system is achieved through decisive and persistent efforts to insure the implementation of decisions.

Management flexibility would be inconceivable without the fast and expedient reaction to changes in circumstances, without the prompt amendment of decisions, if necessary, and the further specification of the tasks facing subordinates, without maneuvering with the forces and facilities and maintaining a system of steady interaction, and so on.

Management stability and reliability are limited by the abilities of GO chiefs and staffs to control the implementation of measures and tasks

whatever the circumstances and, particularly, in the concentrated use of nuclear weapons. In our view, the Civil Defense system as well should adopt the line of target training, leading to the acquisition of skills and practical abilities for stable and reliable management under conditions of active disturbances.

The requirement of management secrecy has acquired a qualitatively new meaning.

The ever-growing importance of the "time" factor faces management operativeness as well with new requirements. In order to upgrade management operativeness within the Civil Defense system at the present stage, decisive improvements are needed in the style and method of work of chiefs, staffs, and services in decision making and execution. Experience shows that conditions are ripe for abandoning the practice of listening to long and mostly self-serving reports. Such reports should be replaced by a higher form of conducting a purposeful and concrete dialogue among the main officials in order to clarify the circumstances and systematically refine the decision of the Civil Defense chief in its various elements.

Also on the agenda is the questions of controlling the information flow from top to bottom and back. It is a question mainly of regulating the times and stages (the sequence) for submission of various reports and developing the necessary practical habits for the processing and "sifting" acquired data with a view to preventing unnecessary duplication. We see in the solution of this problem a great reserve of possibilities for the "unloading" of technical communications facilities and for upgrading management operativeness.

The high quality of Civil Defense management is expressed in the ability to make fullest possible use of the possibilities of available forces and facilities in carrying out assignments under the concrete conditions and according to the requirements of the circumstances. For example, the quality of management is hardly helped by the fact that our staffs are still extensively applying the practice of using trained and highly skilled officials in carrying out labor-intensive technical assignments. For the time being efforts in the field of mechanization and automation of basic processes in the command-management activities of the Civil Defense system are also failing to yield tangible results.

Improving Civil Defense management is a topical need and a primary task facing chiefs, staffs, and services of all units and at all levels.

The commander's decision is the basis of Civil Defense management as well. The implementation of assignments, particularly under complex circumstances, depends mainly on the extent to which the decision is consistent with specific requirements. More than ever before today the implementation of Civil Defense tasks depends on the condition (level) of the

general theoretical and specialized professional training of the main officials. That is why one of the most important trends in the improvement of management under contemporary conditions is upgrading the training and command-organizational abilities of Civil Defense chiefs.

Studies have indicated that one of the weak aspects in the training of chiefs and of a considerable percentage of other officials within the Civil Defense system is unfamiliarity with the nature of modern warfare and, particularly, with modern concepts governing the use and possibilities of nuclear weapons and of the modification of the so-called "classical systems."

Some of the weaknesses in command-management activities also stem from unfamiliarity with the extent of the possibilities of internal forces and formations. The absence of such knowledge makes it impossible to formulate uniform normative requirements on the utilization of formations. The occasional underestimating of organizational work directly with the formations, allowed by some chiefs, staffs, services, and specialists within the Civil Defense system, is also entirely unjustified.

Upgrading the training and coordination of staffs is another contributing factor in improving Civil Defense management. The organizational ability of staffs to gather and process data largely determines the formulation of substantiated decisions by Civil Defense chiefs. The staffs must perform the administrative functions of issuing assignments to their subordinates and organizing the implementation of the entire set of measures insuring the comprehensive implementation of decisions.

Today the staffs face new and far stricter requirements also related to the organization and maintenance of uninterrupted interaction among the various formations in the conduct of SNAVR operations and with neighboring formations and units of the armed forces. It is no secret that wherever no interaction exists among formations or coordination in the activities of the equipment and the personnel the effectiveness of the SNAVR in a stricken area is reduced.

Practical experience indicates that something better remains to be desired in improving the control functions of Civil Defense staffs and in their personal participation in managing rescue and emergency accident repair work in stricken areas. Noteworthy in this respect is the positive experience acquired by the operative group of the obshtina where Engineer Rangelov is Civil Defense chief.

Management means the purposeful creative activities of a wide circle of officials. In this connection we face the task of enhancing the role of services and specialists in the overall organizational-management process of the Civil Defense system.

Effectiveness in Civil Defense management is also related to the further development and improvement of the system of management centers. These centers should be kept in a state of constant high readiness, for use in all circumstances.

Improvements in Civil Defense management largely depend on the full utilization of all available technical communications facilities. Studies have indicated that different departmental communications systems exist and are operational in virtually all settlements throughout the country.

The task now is to conduct a profound study in the local areas to determine available communications and develop a streamlined concept for their utilization for Civil Defense requirements as well. This would resolve important problems such as controlling dispersal and evacuation itineraries; controlling formations moving toward the stricken areas; managing forces and facilities in SNAVR operations, and so on. The Civil Defense system has the advantage of being able to use for its needs the relatively extensive communications facilities of various departments (including those of the armed forces). The problem here is not the lack of communications but the lack of knowledge of the organization, technical condition, and operational possibilities of factually existing local technical communications facilities.

Management within the Civil Defense system could also be improved through decisive automation and mechanization of labor-intensive management processes. In [illegible] view, the principle of plotting the situation could be boldly adopted by the Civil Defense system. This saves efforts and time and achieves greater speed and clarity in entering data on the circumstances and the decisions of Civil Defense chiefs. On the other hand, as technical operations in drafting operational charts are reduced, greater possibilities develop for analytical-thinking activities, for computations, and for substantiating suggestions (decisions), as well as for carrying out a number of other command-management activities.

It is extremely imperative to engage in specific purposeful activities within the Civil Defense system for the automation of a number of other management processes as well such as the formulation and solution of problems with computers; formulation and utilization of stylized documents (tables, diagrams, aids, and so on); decisively simplifying and reducing the number and amount of current documents; developing models and methods for making different computations on a semiautomated basis, and so on.

Civil Defense management cannot be improved without the daring and decisive application of a scientific approach in all areas and realms of command-management activities. Such an approach should be used as a starting point in the efforts to improve the work style of chiefs (staffs) and methods for managing organs, forces, and formations.

The successful management of Civil Defense organs and formations under contemporary conditions requires a profound knowledge of the laws and principles governing management activities and the acquiring of necessary skills for their practical application. The time has come to formulate a management theory for the Civil Defense system. In the course of their activities chiefs, staffs, services and officials must rely on modern management methods, the scientific organization of labor, latest scientific achievements, and the experience of the other fraternal countries of the socialist comity.

As in all other areas of Civil Defense, party-political work must play a leading role in activities aimed at improving management. The party committees and party, trade union and Komsomol organizations are the agencies which could and should have a decisive influence on realizing the need for decisive improvements in the management of the Civil Defense system and in developing the creative initiative of party and Komsomol members and nonparty people in order to raise the system to the level of modern requirements.

Methods for Transmitting Information

Sofia GRAZHDANSKA OTBRANA in Bulgarian No 7, 1980 pp 7-8

[Article by Major Nikola Nikolov: "Ways and Means for Reducing the Time for the Gathering, Transmission, and Processing of Information in Command-Management Activities"]

[Text] From the cybernetic viewpoint management is related to gathering, transmitting, and processing data. Such data consists, on the one hand, of information sent by the projects to the management organ and, on the other, of orders (signals, instructions) going the other way. Ignoring either flow of information makes management impossible. This fully applies to Civil Defense staffs which manage the implementation of a number of measures related to protecting the lives of many people and safeguarding material values.

As the means for waging the armed struggle change, the time needed for gathering, transmitting, and processing data on the circumstances becomes exceptionally important. In previous wars such activities accounted for about two-thirds of the working time of main staff personnel. Under contemporary conditions the quality of management depends to an exceptional extent on reducing the time needed for the information flow. This is one of the indicators of superiority over the enemy, manifested in the faster drawing of conclusions based on the developed circumstances and their effective utilization in practical activities. In terms of GO staffs this means the accurate and prompt clarification and assessment of the situation in the stricken area and, on this basis, the making of decisions regarding SNAVR. Any delay in receiving and processing

information delays the making of decisions on the introduction of GO forces and on promptly undertaking rescue operations. It leads to higher losses and lowers the effectiveness of GO measures. That is why GO chiefs, staffs, and services must seek ways and means for drastically curtailing the time needed for the gathering of data and promptly informing their subordinates.

The best possibilities in this connection are offered by the automation of information processes. In this case we also take into consideration the circumstance that at the present stage in the development of science a great deal of data on the circumstances cannot be subjected to precise quantitative measurements, formalizing, or mathematical modeling. Such data include the moral and mental condition of the personnel, the level of training and practical experience, the personal qualities of commanders, and so on. That is why, along with resolving problems on the automation of information processes the operativeness of staff work must be upgraded as well.

Many of the measures aimed at reducing the time needed for data gathering and assessing the circumstances, following enemy strikes, could and should be foreseen and implemented in peacetime. Multivariant models of possible circumstances must be formulated on the basis of forecasts of possibilities and likely nature of enemy activities, followed by the formulation of decision models. Should the enemy really strike the work must be based on the model closest to the situation, using forms and preliminary estimates in assessing the circumstances and making decisions.

An important prerequisite for the timely gathering and transmission of data is the availability of adequate well organized and properly functioning communications facilities and the availability of personnel trained to operate them.

The expedient assignment of obligations among management organs and officials within them is an important factor in shortening data transmission and receival time. Clarity of obligations and specialization help to upgrade the quality and operativeness of the work. Naturally, narrow specialization should be combined with high-level training in the implementation of functional obligations. In factual circumstances, unquestionably, additional problems and critical situations will arise, some of which will require that individual management functions be performed by people who are not specifically assigned to do so. That is why coordination in activities and interchangeability become particularly important in staff work. In order to insure high-level organization in the work, starting with peacetime an effective and simplified organization must be developed in which data would be transmitted in the shortest possible way. This saves the time needed for the delivery of information and creates prerequisites for effective management. That is why one must consider in advance the drafting of convenient formalized accountability-information documents and the application of a variety of technical

facilities for the fast, convenient, and clear presentation, duplication, and description of circumstances to all performers, who must become familiar with them in peacetime.

Practical experience indicates the existence of extensive possibilities for reducing the time needed for gathering, transmitting and processing data on circumstances following enemy strikes. This requires, above all, a classification of data according to importance and determining which must be sent directly to superior staffs, and which are of lesser value and could be transmitted with greater delays. Every minute of delay in transmitting urgent data lowers their value. For this reason they must be classified according to importance and unnecessary data sifted out. This lowers the overall volume of information and reduces its handling time. Naturally, it is not easy to draw the line between urgent and less urgent information. This question is related to the training, experience, and skill of commanders, chiefs, and performers. Some ofo them could draw important conclusions on the circumstances on the basis of a small number of data and include them skillfully in decision making. That is why the active and immediate participation of the command personnel in the management of information processes is of prime importance. The other performers as well must become thoroughly familiar with and continually improve the fulfillment of their functional obligations.

After the enemy's strikes, once a certain circumstance has been developed, the work of the chiefs (commanders) and the staffs must assume an even more purposeful and specific nature. At that point it is very important for the chiefs to be aware of the assignments of their subordinate staffs, with the conditions and deadlines, and the people with whom they will interact. This will make the efforts of the entire personnel purposeful and organized. They shall seek and acquire the data considered most necessary for that moment.

Individuals assigned the gathering of data must be supplied with reliable and fast communications facilities. The information must be summarized and transmitted along the shortest possible route to the respective performers. The organization of the work must be such as to exclude the need for various officials to demand the same data from their subordinate staffs.

Personal contacts between commanders in charge with subordinate officials by telephone and radio or through messengers is of great importance in the quick and accurate gathering of data on the circumstances.

In the most important projects (sectors) the chief may personally reconnoiter the circumstances in order to make a decision more specific. Some of the data could be obtained quickly by tuning in on the radio frequencies of the senior authority or the interacting organs.

Short and precise statements and standard reports must be used in data transmission. The precise timing for the submission of reports and information on the circumstances by subordinate staffs is of great importance.

While using the received data it is important to note the time for which they were made and the changes which could have occurred in the circumstances since their transmission. Should it become necessary to check on their accuracy, this could be achieved through additional requests. In no case, however, should commanders allow the use of doubtful or erroneous data.

These are merely a few of the ways and means for reducing the time needed for the gathering, transmission, and processing of information. All chiefs, staffs, and services have the permanent obligation of seeking new means for improving information support of management.

Organizational Work in Formations

Sofia GRAZHDANSKA OTBRANA in Bulgarian No 7, 1980 pp 9-11

[Article by Lt Col (Reserve) Todor Nenchev]

[Text] Organizational work in Civil Defense formations is a comprehensive and uninterrupted process carried out by commanders, staffs, and specialists of the okrug services with a view to establishing and maintaining their combat capability for the implementation of assignments. Assuming that the formations are the main and basic force of the Civil Defense system in carrying out its basic task of SNAVR in various stricken areas, in natural disasters, and major industrial accidents, we see that the organizational work of the commander is a very important and essential element of command-management activities in Civil Defense. The basic aspects and nature of such activities are manifested in the following: the organizational and streamlined assembling of various types of information; availability of the necessary equipment, property, and instruments based on inventory tables; maintaining the high political-moral condition of the personnel and a constant readiness to carry out assignments; training formations for action based on GO signals and for SNAVR in a stricken area and in natural disasters and major industrial accidents; training the command personnel at all levels for skillful management of activities in various stricken areas and eliminating the consequences of natural disasters and major industrial accidents.

Practical experience has taught us that such measures are complex and important. They must be carried out within specific deadlines and involve great stress and need for accuracy. The broad scope of such activities enhances the role of the staffs, the specialists of the okrug services, and the party and Komsomol organizations which could contribute an exceptional amount to the successful solution of numerous problems.

We shall consider only two aspects of such activities: the organizational work of commanders in SNAVR preparations, and management in the course of SNAVR.

The organizational work of the commander in preparations for SNAVR involves two basic stages: The first is a peacetime period when problems of staffing the formation with suitable personnel, equipment, property, and installations is resolved. At that point, in the course of the training process, the knowledge and skills of the command and rank and file personnel are enhanced for acting under most difficult and complex circumstances in the current stricken areas and the political and moral condition of the personnel is strengthened. The second stage covers raising the formations to a state of readiness, organizing the march to the stricken area, receiving the SNAVR assignment, organizing reconnaissance, making a decision, informing the subordinates of the decision, organizing interaction, and others. The substantial amount of assignments demands of the commander to possess comprehensive general and specialized training on GO problems, have good organizing qualities, and display firmness and flexibility.

An important aspect of the organizational work of the commander is his ability to properly organize reconnaissance--engineering, chemical, radiation, fire, medical, and so on. Such complex activities must be focused in such a way as to insure the uninterrupted and prompt receival of data on the circumstances: the nature of destructions and fires, the radiation circumstances, road conditions, and others. Prompt and accurate information will help the commander to make a proper decision.

The making of a decision, which is the basis for controlling the formation, is one of the most important aspects in the commander's organizational activities. In all cases he must see to it that the work in the formation is so organized that decisions may be made and subordinates informed within a minimum amount of time. Bearing in mind that in most cases the formation commander will receive the assignment directly in the stricken area the great organizational skill required on his part in his management activities becomes clear.

Usually the formation commander organizes his reconnaissance from one, or, rarely, two centers. After refining the necessary data from the reconnaissance, clarifying the assignment, and assessing the circumstances, he specifies the work targets of the crews (sections), determines where the main forces and facilities will be focused and the reinforcements which individual crews may need. The tasks of the subunits are assigned through verbal orders and instructions at the place of departure or directly at the work site. Orders and instructions must be clear and short.

The organization of interaction is an important aspect of the commander's management activities. Interaction is organized both among individual subunits within the formation as well as with the added formations and the neighbors. The stricken area must be demarcated in terms of target, time, and place. It has always been considered that this is one of the most important and responsible aspects of the commander's activities in SNAVR. Even though the commander is the direct organizer, the staff of the combined detachment must prepare ahead of time everything that the commander may need in organizing the interaction. Taking into consideration the variety of forces used to resolve the SNAVR task, the commander pays particular attention to interaction between engineering and fire-fighting formations, between engineering and medical formations, and others.

The art of organizing such interaction consists of the ability of the commander to properly define the decisive role of the various specialized formations in the different work sites at any given time of the SNAVR. He must direct the efforts of all other formations on the successful solution of the problem. The formation commander must never consider that the organization of interaction in the course of reconnaissance covers the entire matter. Interaction activities are continuous throughout the work of the formation in the stricken area, for during the SNAVR a number of questions arise requiring the fast intervention of the commander. Any disturbance of interaction must be corrected rapidly.

The method and sequence of work of the formation's commander on the spot (at the work site) in organizing SNAVR depend, above all, on the time at his disposal. In addition to the organization of his work the formation commander must always try to provide the necessary time for subordinate commanders so that they too may organize the implementation of their assignments in the SNAVR sites.

The method for managing the SNAVR within the Civil Defense system has been practiced frequently in exercises with the formations and, particularly, in the course of comprehensive exercises. Available practical experience indicates that still many formation commanders allow some weaknesses in the organization of their work in managing SNAVR. The most typical among them are as follows:

After organizing SNAVR work--assessing the circumstances, making a decision, informing the subordinates of the decision, carrying out reconnaissance, and organizing interaction--some commanders believe that their role has been fulfilled. In their view, control and assistance to their subordinates in the course of SNAVR is their secondary obligation in command-management activities. This view is erroneous. The circumstances prevailing in SNAVR are complex and change rapidly. The commander must follow them closely and, through his orders, direct the forces and

facilities along the basic direction and use his deputies in secondary sites.

Practical experience has shown that a commander who fails to check on the implementation of assignments, who is not entirely familiar with the circumstances and has not followed their changes would find it difficult to influence such changes. A commander who waits for reports in his control center and relies mainly on communications facilities loses personal contact with the sites, the formations, and the men. He is unable to assume overall control of SNAVR. Consequently, such a commander cannot successfully fulfill his assignment. In order to be expedient, control must be total and comprehensive. It must involve the use of individual specialists from the okrug services and staffs so that the successful implementation of the task may be insured on the spot, concretely, and on time.

An important aspect in the activities of the commander in the course of SNAVR is to organize the various types of support.

The political work which must be done among the personnel working in the stricken area is not the duty exclusively of the deputy commander for political affairs of the formation. It is also one of the basic tasks in the organizational work of the commander in the course of SNAVR. Bearing in mind the great mental and physical stress of the personnel the importance of the work done by party and Komsomol organizations increases exceptionally. It is very important for the commander skillfully to direct their activities in mobilizing the manpower. A variety of methods may be used--leaflets, flash news, slogans, citing the best workers, or popularization of heroic actions. Personal contacts between troops and commanders assume great importance.

The complexity of SNAVR demands that the commander pay particular attention to supplying the formation with everything necessary for the successful implementation of assignments. Hence the great role of material-technical, medical, and other types of support, security, observation, delivery of material facilities, directing victims and casualties to the proper areas, and restoring the readiness of the formations. These are all tasks whose implementation depends on the organizational work of the commander and on his managerial activities in SNAVR.

Organizational work in the formations is a complex process within the command-managerial activities of the commander and the Civil Defense staff. In this case knowledge, ability, and comprehensive training in matters of Civil Defense are important prerequisites for the successful solution of the difficult and responsible tasks which the party and the government have set for protecting the population and the national economy.

SNAVR On-Site Management

Sofia GRAZHDANSKA OTBRANA in Bulgarian No 7, 1980 pp 12-14

[Article by Engineer Stavri Antonov, Civil Defense chief of staff at the Lead and Zinc Plant in Kurdzhali]

[Text] Rescue and emergency damage repair work (SNAVR) in a stricken area, carried out by GO site formations, remains one of the most complex, difficult, and responsible activities which cannot be carried out in one or two hours as is usually the case in formation training and even during comprehensive exercises. A stricken area would require much longer work. Furthermore, several days, a week, or even a month may be needed for the repairs.

SNAVR require extreme stress and will inevitably involve fear, panic, and disorganization. For this reason the forces and facilities must be skillfully managed. This is an element to which we have not paid the necessary attention so far in the course of our training activities. We have not fully covered the problems of management and control of SNAVR at the project, either in the course of staff exercises or practical Civil Defense training and exercises. This is a major shortcoming in the work of the staff and the services, adversely affecting the training of the formations.

What have the practical results been? In accordance with established procedure we engaged in the systematic reconnaissance of the stricken area. We summarized the obtained data, clarified and assessed the circumstances, issued preliminary orders, heard short reports, information and suggestions submitted by some service commanders and, finally, heard the suggestion of the chief of staff on making a decision and on the order to be issued by the project's Civil Defense chief for engaging in SNAVR in the stricken area.

After the order was issued, we usually took the formations to the stricken area to carry out SNAVR. In practical terms, this concluded the activities of the command, the staff and the services. The formations operated in accordance with a concept and a plan drafted in advance. The real circumstances, however, would never be so easy as to enable the GO formations to be able to eliminate the consequences all at once, in one or two hours.

The moment the formations enter the area the real circumstances which an overall reconnaissance would have been unable to determine in detail would become inevitably apparent. Furthermore, in the course of SNAVR usually changes and complications arise in the circumstances, requiring a quick reaction with new decisions by the command, the staff, and the formation commanders. Additional orders will have to be issued on the organization of interaction, regrouping GO forces and facilities,

insuring material and technical support, and a number of other activities the need for which arises in the course of the work. It is precisely this that calls for uninterrupted control of the development of SNAVR. Yet, this was precisely our weak point.

That is why we concentrated precisely on such activities in preparing for a model exercise with the formations of one of the work shifts at the project: managing Civil Defense forces and facilities in the course of SNAVR in a stricken area. We took into consideration that in a real development of events the problem of management would assume priority, for troops and commanders operating in the stricken area under exceptionally difficult circumstances would be steadily reporting, requesting, and insisting, while the command, the staff, and the services and specialists will have to react promptly and rapidly, decide, order, and guide SNAVR. Under such complex circumstances there is no time for delays or theorizing.

For this reason, starting with peacetime, along with upgrading the combat training of the command and rank and file personnel, the system of staff training, exercises, and classes must include practicing and mastering the management of GO forces and facilities. How is this to be accomplished?

The concept and plan for the model exercise at the Lead and Zink Plant in Kurdzhali called for the existence of more complex conditions in the stricken area, requiring the extensive work of the formations, leading to inevitable difficulties and demands formulated by the commanders, on the one hand, and additional decisions and orders issued by the GO command and staff in the course of SNAVR, on the other. We indicated "destructions" in communal-power grids, production units, installations and mechanical equipment.

Complications in the stricken area were indicated sequentially and approximately the way we assumed they would develop in a factual situation. In turn, this greatly hindered the work of the formations, created heavy physical stress and mentally affected the mobilization of the personnel in carrying out the formation's assignment. The physical stress was achieved by carrying out a substantial amount of additional production-economic activities; the psychological effect was achieved through simulations and, particularly, a special sound recording. We established in advance with specialists from the okrug GO staff the factual way in which, on the basis of our requests, and in the course of SNAVR, they will supply ambulances, fire engines, and other motor vehicles and engineering equipment. We noted the areas and ways of manifestation of interaction in terms of time and place among the formations within the stricken area. To this effect we established radiotelephone and other communications between the GO staff and the commanders of the basic formations. We conducted four exercises with the participation of the communications section, the radiotelephone operators of the

rescue detachments, and the reconnaissance detachment; finally, we conducted two comprehensive exercises in managing the manpower and facilities in the course of SNAVR.

The sequence in management operations was the following: The moment the formations entered the stricken area all commanders reported the circumstances through their portable radios and by telephone to the GO chief of the project. In the course of the rescue operations they requested additional reinforcements with men, equipment, materials, and others. The GO chief discussed with his deputies, the staff, and the services and specialists the changes in the circumstances and made quick decisions and issued the necessary orders to the respective officials. Immediately after that the formation commanders and service chiefs conducting the SNAVR reported again and submitted new requests. Meanwhile, the GO chief with officials from the staff and the services and other specialists had already entered the stricken area and were guiding SNAVR on the spot. The chiefs of services personally assumed control over SNAVR while the operative group remained at the control center.

Reports and orders followed each other.

The commander of the second rescue detachment reported: "The buried entrance to the shelter in the administrative building has been found. We have supplied fresh air to those inside. Six of the casualties at the Lead Production are in very bad shape. I request immediately two cars to take them out."

The plant's director immediately ordered the chief of the transportation service to request from the okrug GO staff two cars. He ordered the chief of the medical service to assign a medical team from the first rescue detachment to help the casualties in Lead Production.

The chiefs of the transportation and medical services carried out their assignments. The vehicles carried out the "severe casualties," returned to their base and were released.

The commander of the project's fire fighting team reported: "The fire in the area of the Electrolytic Shop is spreading and is threatening the fuel oil area. I request immediately two fire engines to put out the fire."

The GO chief ordered the chief of staff: "Immediately request two fire engines from the okrug GO staff. The fire fighting service chief will direct the efforts of the fire fighting team to the fuel oil area by transferring there the fire fighting section putting out the fire of the wooden huts and preventing the spreading of the fire to the fuel oil area before the arrival of the fire engines.

"The commander of the first rescue detachment shall assign to the fire fighting team two rescue sections from the first rescue team."

The officials involved carried out the order of the GO chief. The fire engines were factually sent to the site (the fuel oil area) after which they were released and returned to their base.

The commander of the power restoration team reported as follows: "The damage at substation No 6 has been repaired and electricity has been supplied to the shelter of the administrative building. I am trying to provide temporary electric power for SNAVR in the basic production facilities. Here is a request for the necessary materials."

The GO chief ordered the material and technical supply service to immediately provide the requested materials. He ordered the energy supply service to assume personal control over electric power supplies to basic production facilities.

The commander of the accident-chemical crew reported the following: "We are concluding the rescue operations. As a result of a break in one of the tanks the entire area around the acid shop is flooded with sulfuric acid, 10 to 15 centimeters deep. This has necessitated a stop in the emergency accident repair operations in this production facility. A great deal of gas (sulfur dioxide) is draining out as a result of the destroyed external heat exchange of contact apparatus No 2, spreading low on the entire plant site."

The GO chief issued the following order: "The GO formations in the stricken area of the plant's site will put on their gas masks and continue with the SNAVR. The commander of the accident-chemical crew will take measures immediately to repair the breakdown of the external heat exchange of contact apparatus No 2. Two sections of the accident-technical crew shall be assigned to his aid.

"Two sections of the decontamination crew with the automatic machine (the tank), together with the accident-chemical crew will undertake the cleaning, neutralizing, and washing of the area around the acid shop. . ."

Such dynamic circumstances enable formation commanders to be in constant touch with the GO commander and staff in the course of the SNAVR and report changes in the cirucmstances. Steadily receiving information on SNAVR and on the basis of personal observations (since they are personally within the stricken area), the command, staff, services and other specialists determine and react to the change in circumstances, issuing additional orders on interaction among formations, material and technical support, supporting SNAVR with transportation, engineering and other equipment, providing fuels and lubricants, supplying requested parts, equipment and materials, and so on. Requests are sent to the superior

GO staff as well and to the department under whose jurisdiction the project is to provide material and technica' support for emergency accident repair operations.

Naturally, at this point we cannot state precisely how and in what order and sequence will the forces operating in the stricken area be managed, for it is impossible to precisely predict the development of the circumstances. However, one thing is clear: The command, staff, services and formation commanders in the stricken area cannot manage SNAVR without rapidly reacting to the circumstances and skillfully controlling the forces, for they would be pressured by the circumstances themselves. The troops will call upon them for decisions, aid, assistance, interaction, and so on. The successful implementation of all such tasks requires the extensive advance training of GO command personnel.

Experience has indicated that it would be inconceivable to hope for readiness in SNAVR unless the command personnel has been properly prepared to manage and guide the forces and facilities operating in the stricken area. That is why our urgent task now is to extensively forecast and determine in advance the possible basic variants for actions at the site which might be required by changes in the complex circumstances in the course of SNAVR in a stricken area. Such problems must be practiced systematically within the system of staff trainings, command-staff exercises, and comprehensive exercises, starting with the command, the staff, the services and the specialists, followed by practical training with the formations with a view to steadily upgrading the skill and experience of the command personnel in managing and controlling forces and facilities in the course of SNAVR in a stricken area.

Disaster, Accident Information

Sofia GRAZHDANSKA OTBRANA in Bulgarian No 7, 1980 pp 15-17

[Article by Major Engineer Kamen Komarski]

[Text] The availability of rapid and accurate information in the case of an outbreak of a natural disaster or major industrial accident is an important prerequisite for making the necessary decisions and taking preventive measures to limit the consequences and reduce the size of casualties and material losses. One of the primary tasks in accidents and natural disasters is the rescuing of the people in the stricken areas (buried under wreckage, drowning, trapped in burning buildings, and others), and the restoration of destroyed engineering facilities and cables and communications lines, and the resumption of the disturbed production process.

Despite the tremendous efforts, at this stage of development mankind is unable to prevent the outbreak of natural disasters. However, prompt

information from the affected area is of decisive importance in reducing the consequences of such phenomena. Information on disasters or accidents and on their consequences could be most varied. That is why it must be controllable, i.e., we must be able to determine the time, extent, content, and sequence of receiving (transmitting) data needed by the various organs and agencies, according to their significance and content.

According to the time needed for its gathering, the information may be arbitrarily classified into primary, subsequent (intermediary) and final (complete). In natural disasters and major industrial accidents primary information is exceptionally important. If offers the possibility for a most general orientation on the event.

It is on the basis of such information that the necessary decision may be made. A major requirement regarding primary information is the speed of its delivery. We can easily imagine the importance to an area which has had an earthquake, for example, if the news of the earthquake is received several hours later. The same would apply to delayed information on a threat of flooding as a result of a swollen river, or the cracking of a dike or dam. A delayed communication would be catastrophic in terms of rescue operations or the evacuation of endangered people, animals and material values.

The fast gathering of primary information is both a condition and a prerequisite for the prompt issuing of specific instructions. It is precisely this that determines the type of forces to be brought into a state of readiness and the facilities to be procured for rescue and emergency and accident repair work. This information is also important for the prompt organization of interaction with neighboring unaffected areas.

The primary information may be directed to the superior organization and to the people facing an immediate threat. In the former case the purpose is the adoption of fast measures for the organization of rescue operations; in the latter, it is the prevention of human casualties or reducing them to a minimum. A characteristic case was the huge landslide in Orsoya Village, Mikhaylovgrad Okrug. The initial characteristics of the slide became visible on a Saturday, when most of the people in the okrug were resting. Thanks to the fast and effective intervention of the official on duty at the okrug people's council, who was able quickly to inform the corresponding agencies, no human casualties occurred and most of the property of the affected population was saved.

The subsequent (intermediary) information must be richer and more specific. It must contain more factual data and information which would make it possible to identify in greater detail the areas affected by the disaster (accident) and the approximate number of casualties. This

directly influences the making of decisions on rescue operations. The determination of the areas most severely affected by the disaster or the accident makes it possible to focus on them the main efforts. Unquestionably, this gains valuable time in organizing effective aid in rescuing human and animal victims and material values. The intermediary information could indicate the neighboring areas with which interaction could be established, the type of forces and facilities to be prepared and the direction they must follow in contributing to the overall organization of rescue operations.

The final (complete) information provides the most detailed picture of the disaster or the accident. It should be able to provide the reasons for the accident or the natural disaster, the precise number of casualties, the extent of damages caused to the different areas, and so on. The decisions based on such information would be based mainly on restoration activities.

We have already emphasized that the stages of information cover not only the time covered but the various points it must cross. It is a question of the path which must be covered by an information flow before rescue and emergency accident repair work may be most precisely consistent with the requirements of effective management activities. The nature of the information should determine the agencies which must become involved in the organization of the respective rescue measures.

One of the basic requirements concerning information is its value. This value is determined on the basis of a variety of factors the most important of which are the method of communication and the time of communication. Information on sudden or unexpected disasters or accidents (earthquakes, collapsing bridges or dikes, accidents in chemical combines, and others) is more valuable and more meaningful.

Meaningfulness is another essential requirement of information. It is determined not by the size of the communication but by its essence. Unnecessary details hinder the finding of useful information. The sifting out and the search for common patterns makes such informatin significant.

Reliability is another information requirement. Indeed, should an item of information be delayed it may lose some of its topical value. However, should it be hasty and inaccurate or unreliable, it becomes meaningless. In such a case its meaning would not indicate the most accurate way to act, hence the impossibility to properly focus efforts on the decisive sector. In general, all information should be objective. Characteristics such as exhaustiveness, accessibility and uniformity of meaning as well should not be underestimated.

Another quite essential problem is that of receiving, processing, and passing on the information flow. The wish to gather (transmit) timely

information in order to check on its quality and content should in no case be self-seeking. The accumulation of rich factual data makes it possible to establish certain patterns in the appearance or outbreak of natural disasters or industrial accidents and to provide an assessment of rescue operations, management activities, preventive measures, and so on. Furthermore, the information flow must be accompanied by a specific study and evaluation of the event in order for management and rescue operations to be fully effective.

Some natural disasters may cover a considerable area of one or several okrugs. In such cases the information must be gathered, processed, and analyzed by the agency which is able to receive it and draw proper conclusions. Such activities considerably contribute to the accurate assessment of factual circumstances. At the time of the natural disasters in Vidin Okrug (icing of most of the roads and freezing of conduits) in the winter of 1979, and in the hailstorms, torrential rains and floods in the summer of 1979 in Stara Zagora, Burgas, Turgovishte and Shumen okrugs, the fast, prompt, and accurate information alone helped the prompt organization of rescue operations. This helped promptly to understand what areas and settlements had suffered most severely, and where the main forces and facilities should be concentrated.

We already mentioned that information on a given set of circumstances is vitally needed not only by the command personnel but by the population, victim or not of natural disasters or industrial accidents. It is a question of the critical time which triggers mental stress, panic, or groundless rumors. For example, earthquakes usually affect a large area and trigger in people unusual feelings, concern, and excitement. Prompt, systematic and objective information provided by the mass information media may, in most cases, prove to be decisive in establishing the necessary order and calm. Bearing in mind the current possibilities of our seismic equipment and communications facilities, the stages in reporting an earthquake, for example, could be the following: The advance notification (toward the 10th minute) should announce a recorded earthquake on the territory of our country; the subsequent (intermediary) communication should contain data on the epicenter, and the power and intensity of the earthquake. The final announcement should contain information on the extent of the destruction in the epicenter and in other affected areas.

As the experience acquired from the 18 May 1980 earthquake indicates, the observance of this sequence (stages) in supplying information is of major importance in preventing stress, panic, or rumors. Such stages could be followed also in providing data for broadcasting by mass information media in the case of floods, heavy snowfall, landslides, and others.

The nature and severity of natural catastrophes and major industrial accidents differ. Each specific case has its characteristics, for which reason it must be specifically determined what requirement or characteristic of the supplied information will be of the greatest importance at a specific time. In all cases, however, its role remains decisive.

The experience acquired in eliminating the consequences of natural disasters and major industrial accidents indicates that at the present stage information receiving and processing is still a weak link which affects the organization of SNAVR. It is precisely this experience that indicates the importance of meeting the basic requirements concerning information whose nature and role we discussed.

PROFILES OF LOCAL CIVIL DEFENSE LEADERS

Sofia GRAZHDANSKA OTBRANA in Bulgarian No 7, 1980 pp 24-25

[Individuals awarded for services to Bulgarian Civil Defense]

[Text]

Engineer Ivan Khristov began his labor career at the Georgi Genev Woolen Textiles Combine in Gabrovo as a simple worker. Later he became chief of shop and, subsequently, close to 14 years ago, combine director. He has been chief of GO [Civil Defense] of the enterprise since that time.

A number of problems related to preparations for the protection of the enterprise were awaiting their solution: underestimation of the need for protective activities, poorly organized training process, and unsatisfactory results. Engineer Khristov properly understood that his first task was to acquire the necessary training himself. He then directed propaganda activities in the combine in such a way as to encourage the people to become involved with GO.

"Today I find it considerably easier to head protective operations at the project," Engineer Khristov said. "For the past six years Stoyan Nedyalkov

has been GO chief of staff at the combine. He has adequate military-engineering training and is thoroughly familiar with GO problems. He is persistent and resourceful. Whenever he presents me with a problem, he has always considered in detail and extensively the suggestion he would make. That is why he defends his ideas stubbornly."

For quite some time there has been order and discipline in training at the combine. The problem of finding the time for training the formations has been resolved properly. In most cases training takes place after work or during the day of rest. There is adequate material and technical support. It is not easy to be the chief of GO in such a big combine consisting of several shops dispersed throughout the city. This requires skill, experience, and a feeling for organization in the steady efforts to carry out the production plan and resolve GO problems.

Engineer Khristov is experienced in GO matters. This helps him properly to direct the efforts of the service chiefs and the command personnel. On his initiative, in 1976 the combine undertook an intensive study of the stability of the project under a critical situation. The planned measures are already being carried out: A separate water reservoir was built. A pumping station is under construction to meet the combine's requirements. The warehouse for emergency raw materials is ready. Radio telephones have been acquired to insure communications among all shops and sheltering installations have been planned. . . . All these acquisitions were demonstrated at a model class on resistance organized during a rally of chiefs of staff of okrug GO staffs. A number of visual aids, posters, and diagrams were used at the exercise. The high rating received by the combine personally from the chief of GO of the Bulgarian People's Republic is an indicator of high achievements as well. Unquestionably, Engineer Ivan Khristov should also take credit for this.

The combine's GO chief has the reputation of a strict, exacting, and efficient manager. He is fair in the assessment of people for which reason they respect and honor him. Engineer Ivan Khristov has been repeatedly presented with awards for his thorough and active efforts. He is the bearer of the "People's Order of Labor--Golden," Red Labor Banner, and others. He has been awarded the three classes of the badge For Services to the GO of the Bulgarian People's Republic. These awards stimulate him to engage in even more meaningful activities and achieve new successes in protecting the population and the national economy.

In 1979 Stoimen N. Mirchev was awarded the badge "For Services to the GO of the Bulgarian People's Republic" for high successes in training the accident-rescue detachment of the construction and installation combine in Pazardzhik for impeccable activities in complex circumstances.

Initially he found the work hard. However, the knowledge he acquired in the GO school in the capital, and his persistence and ambition helped him quickly to master his obligations as commander. Mirchev pays particular attention to practical training, seeing to it that they take place under the most realistic conditions maximally possible.

The extent of training of the detachment is checked in the course of training classes and exercises. However, he also successfully uses the opportunities presented by unexpected investigations conducted in the presence of representatives of the okrug and city staffs. That is how every fighter and commander is kept in a state of constant training and readiness and everyone knows and excellently fulfills his functional duties. The commanders of teams and sections participate in command staff training, in addition to staff specialists. It is thus that they expand and enrich their knowledge of managing and organizing interaction in rescue operations and on the fast gathering, processing, and transmission of information within their range of action.

Currently the detachment operates separately as a combined detachment for mechanized operations. It has been supplied with more equipment. This calls for skill in handling such equipment. Mirchev skillfully used the comprehensive exercise conducted in the obshtina last year to test the

level of readiness and practical skills of troops and commanders and the extent to which the time for building antiradiation shelters could be shortened. The results were more than encouraging. They also gave him the idea to use in the course of the practical exercises with the detachment construction sites, thus creating a more influential and truthful environment and possibility for promoting GO competition. It is no accident that competition here is both among teams, sections, and individual members as between the Water Supply and Sewers and Low Construction Services. The successes achieved in the competition deservedly placed the detachment in second position in the okrug last year while the staff of the Accident Rescue Service has been first for a number of years within the system of the Ministry of Construction and Construction Materials in the preparation of documents, improving the announcement system, and perfecting work methods and the practical training of troops and commanders.

Stoimen Mirchev clearly realizes that all this requires a steady search for new solutions and the use of a variety of technical achievement in setting up and training the detachment. However, he is not the kind of a person to yield to difficulties. He always seeks the help of the okrug staff and his colleagues, and tries to organize and conduct the training so that better results may be achieved compared with the previous year. He frequently hikes during days of rest. These are times when, once again, peacefully, he thinks about further improvements so that the combined detachment for mechanized operations may become a powerful nucleus of the okrug's GO.

Boris Tsv. Borisov has worked as bookkeeper and specialist at the Pazardzhik Okrug Civil Defense staff for only 2 years. Within that time he was able to win the love and respect of his colleagues because of the great zeal he displays in carrying out his duties, his thorough knowledge of the work and his informal relations with the people.

Thoroughly familiar with the requirements regarding the filing and storage of documents, from the very beginning Borisov assumed the obligation of classifying the various documents and work publications in such a way as to reduce to a minimum the time needed for their processing, thus considerably helping his colleagues as well. He began with a thorough study of all documents and titles and undertook to improve and organize the documentation of the entire staff in accordance with norm stipulations. He worked hard to introduce special catalogues which included the list of materials needed by the staff specialists. The classifying of publications in an ascending order and by title helps him to save time in issuing and receiving materials. He has also provided an efficient and convenient method for storing the work cards and the various blueprints and charts kept in special holders. His attentive attitude and love for the work are visible everywhere--in the beautifully drawn signs, his orderly workplace, and the speed with which he can locate the required materials, lectures, or charts.

Boris Borisov shares with his colleagues in the okrug projects his rich experience in improving the organization of the work with documents, acquired in various training courses in Bulgaria and the Soviet Union. He actively helps the chiefs of staff in developing conditions for the proper and reliable storage of and work with documents and closely follows the observance of requirements. He is uncompromising when it comes to omissions. His current task is to make projects under his jurisdiction model in this respect. Implementing this task and in his daily work he relies on the help of the staff specialists and the support of the party organization.

In 1979, when his staff colleagues warmly congratulated him for receiving the badge "For Services to the GO of the Bulgarian People's Republic, Second Class," Boris Borisov pledged to work even better, as should a real Civil Defense fighter and party member whose tireless and fruitfull work has been duly acknowledged.

Engineer Sasho L. Andreev is a graduate of the Higher Engineering-Construction Institute in Sofia. He is deputy chief of staff in charge of engineering protection in the Vidin Okrug Civil Defense staff.

This young specialist particularly values organization in everything. When he joined the Civil Defense system 9 years ago his knowledge did not exceed the one acquired at the institute. Naturally, this was insufficient. With his typical persistence he undertook to study in detail the nature and the tasks of civil defense.

"At that difficult time," he says, "I was greatly helped by Officer Elenkov, the GO okrug chief of staff. It was then that another major event happened in my life--I became a party member."

Engineer Andreev is aware of the great importance of precisely observing the stipulations of civil defense norms in construction, not only industrial but administrative, civilian, residential, and so on. In his first years of work Engineer Andreev established that the normative documents were almost unknown in some services, as a result of which their stipulations were rarely met. Being young and energetic he undertook to clarify the responsible nature of such requirements and to apply them. He met with the full understanding of Comrade Dzhumerkov, the chief architect of the okrug people's council. At the very first organized meeting with okrug specialists on this subject a practical demonstration was given of what must be done to upgrade the stability of national economic projects and settlements. After that meeting there has been no violation of normative documents in any construction project.

Engineer Andreev clearly realizes that without proper training and material facilities achieving great successes would be difficult. He undertook to plan the building of training grounds. With the support of the party and administrative managers in Vidin, in only 10 months he completed the training facility. Currently the command personnel and the formations are acquiring excellent training in proper classrooms and adequately prepared training areas.

Sasho Andreev will never forget the March 1976 earthquake which affected Vidin as well. He was attending a GO training class and was able to see both the consequences of the panic and the activities of GO personnel, with whom he worked, who were trained and accustomed to act in critical situations. They established contact with the proper services and made ready the available motor vehicles, tractors, and engineering equipment. A team was sent to the dike--the most vulnerable area of the city. Even though no destruction was reported, the disaster tested the skill of chiefs and commanders in heading the operations of services and formations under complex circumstances.

Engineer Sasho Lozanov Andreev has been awarded twice the badge "For Services to the GO of the Bulgarian People's Republic" for his dedicated efforts.

CARDINAL LEKAI GIVES PRESS BRIEFING AT CHAPEL CEREMONY

Budapest UJ EMBER in Hungarian 10 Aug 80 p 2

[Article: "Cardinal Lekai's Press Briefing"]

[Text] On the morning of 25 July, Cardinal Laszlo Lekai, primate and archbishop of Esztergom, held a press briefing at the Central Seminary about the artifacts destined for the Chapel of Our Lady of Hungary in Rome, which is scheduled to be consecrated this autumn. The press briefing was attended in great numbers by the representatives of the Hungarian press, television and radio. The finished reliefs slated for delivery to Rome were shown by Ilona Brestyanszky in an impromptu exhibit in the corridor. Several members of the Assembly of Hungarian Bishops were there, and the representatives of the non-Catholic religious press were also present. The State Office for Religious Affairs was represented by Chief Section Head Laszlo Bai.

In his introductory statement the cardinal primate has pointed out that by sending a royal crown to St. Stephen, Pope Sylvester had fulfilled only one of the king's two requests. His second request was fulfilled when the pope awarded the king a chapel and a pilgrim-hostel right adjacent to the old St. Peter's Church, which were to be used by Hungarian pilgrims. These two Hungarian edifices stood there until 1776. In that year the construction of the sacristy of St. Peter's Basilica was begun. This resulted in the dismantlement of all of the buildings standing in its way. These buildings also included the Hungarian chapel and the pilgrim-hostel. The price of this expropriation, however, was amply repaid by the Holy See. In 1977, at the time of the Cardinal's Consistory, Cardinal Lekai presented two requests to Pope Paul VI: that it be permitted for the dimensions of the Basilica of Esztergom be inscribed in the pavement of St. Peter's Basilica among those of the largest cathedrals of the world; and that the Holy Father grant the Hungarians a chamber in the subterranean level of St. Peter's Basilica in honor of Our Lady of Hungary, in place of the dismantled Hungarian chapel. Both requests were granted.

The purpose of the Our Lady of Hungary Chapel is threefold: To continue St. Stephen's spiritual heritage; to enable Hungarians from both home and abroad to meet as brothers in the Roman residence of Our Lady of Hungary, even though they are often at odds with one another both in approach and in their emotional attitudes; and finally, to point the way toward Pax Europaea, i.e., toward the development of European peace, through the portrayal of incidents taken from the lives of Hungarian saints that decorate the walls of the chapel.

The cardinal archbishop emphasized that the Chapel of Our Lady of Hungary in Rome is in the process of being made a reality. It had received the prior approval of the State Office for Religious Affairs, which office has generally aided this undertaking. For this he expressed his deep gratitude. The task of acting as conscientious judges was performed by the Lectureship of Fine Arts, with the inclusion of church specialists.

Following this, the cardinal thanked everyone who was involved in the preparation of the chapel, and then listed the names of the artists. Professor Laszlo Gero performed the engineering work. Robert Csikszentmihalyi, Gyula Kiss Kovacs, Andras Kiss Nagy, Sandor Kiss, Pal Ko and Laszlo Marton were responsible for preparing the stone reliefs depicting some of those incidents in the lives of Hungarian saints that were exhibited at this press briefing. Imre Varga had cast the figures of Our Lady of Hungary, as well as of St. Stephen in bronze, while Amerigo Tot had prepared memorials to those four popes who had some connections with this chapel.

After examining the exhibited art works, the representatives of the press asked several questions of the cardinal primate.

The exhibited art works may be seen between 8 a.m. and 6 p.m. every day until the middle of August at the Central Seminary (Budapest V, Eotvos Lorand utca 7).

CHURCHMEN, OFFICIALS CELEBRATE 30TH ANNIVERSARY OF PEACE PRIEST MOVEMENT

Budapest UJ EMBER in Hungarian 10 Aug 80 p 3

[Article: "In the Spirit of Fraternal Unity"]

[Text] The national and county leaders of the Opus Pacis and of the Catholic Committee of the National Peace Council, as well the chief representatives of Hungarian religious and social life have all participated in the commemoration of the 30th anniversary of the foundation of the Hungarian Catholic Peace Priests' Movement. This was done by means of cordial festivities at the movement's Dezso Street headquarters on 30 July. The presidency of this festive conference has been entrusted to Jozsef Ijjas, papal chamberlain, archbishop of Kalocsa, and president both of the Opus Pacis, and of the National Peace Council's Catholic Committee.

The guests included several members of the Hungarian Council of Bishops, as well as many leading social and political leaders, among them State Secretary Imre Miklos, president of the State Office for Religious Affairs; Mrs Nandor Sebestyen, president of the National Peace Council; and Bela Kovacs, secretary of the National Council of the Patriotic People's Front. The members of the Presidium also included Canon Imre Biro, secretary general of the National Peace Council's Central Committee [OBKB], and Abbot Vicar Bela Mag, its executive director.

Opening Statement by Archbishop Ijjas

Following the singing of the Hungarian National Hymn and the recital of Geza Szabo's poem, the official session was opened by Archbishop Ijjas. He emphasized, among other things, the following: "We are celebrating today an anniversary. If I may say so, we are celebrating the birthday of the Hungarian Catholic Peace Priests' Movement. It is part and parcel of our finite earthly existence that we are keeping track of time. The date of this birthdate is 1 August 1950. Its official name in those days was the National Peace Committee of Catholic Priests. Its viability, the hopes for its development, and the worthiness of its activity can be substantiated by documents, and our nation's Catholic prelates are among

some of the worthy witnesses. These include Archbishops Gyula Czapik, Jozsef Grosz, and Endre Hamvas. They have sworn to its authenticity in the house of our constitution, as did about 300 priests and nuns, the initial supporters of the Peace Priests' Movement. The memory of these veterans lives on among the members of this movement. Their names are preserved with reverence, and their achievements are esteemed even after their death, or during their respected old age.

"The memory of the front-line fighters of the movement is especially vivid in our minds. We speak their names with reverence. But, instead of bemoaning their passing, we look upon their deeds as shining lights, comparable to lighted candles that are there for our encouragement. It is in this spirit that we recall on this festive occasion the memories of our past secretary generals, Miklos Beresztoczy and Richard Horvath. Let their memory be blessed.

"In opening our festive meeting, let me start immediately with a proposal to fill the vacant secretary general's post in the OBKB. Upon the advice of the Central Secretariat, let this legacy of Miklos Beresztoczy and Richard Horvath pass on to the Prothonotary Canon and Vicar Imre Biro, who is also a member of the National Assembly, as well as of the Presidential Council."

Cardinal Lekai's Letter

Following this, Archbishop Ijjas requested that Canon Vicar Ferenc Weisz read Cardinal Archbishop Laszlo Lekai's letter to Archbishop Ijjas:

"Most Reverend Papal Chamberlain, Archbishop, and President:

"I am sending my warm greetings to the Catholic Peace Priests' Movement, which is celebrating its 30th anniversary. The members of this movement have been most useful participants of the constructive dialog that has been going on between the church and the state for a whole generation now. It is my ardent wish that they should continue to advance the cause of our Catholic Church and the well-being of our Hungarian nation with their services of religious spirituality.

"It is of permanent importance that--in line with the Holy Father's guidance and examples--we priests should also let our views be known in defense of a just peace. In the spirit of human brotherhood and of the common human fate, we must continue to search for paths upon which we are able to cooperate even with persons of different ideological persuasions.

"It is my fervent desire that the Catholic Peace Priests' Movement should serve effectively, and without exception, the cause of increasing human dignity, both in our country, and throughout the world. This is the firmest foundation of all fruitful cooperation.

"I am praying for the recently deceased leader of the movement, and I am sending to you, Most Reverend presiding Archbishop, as well as to the other participants of that festive conference, my fervent good wishes."

[Signed] Cardinal Laszlo Lekai, primate, archbishop, and president of the Hungarian Bishops' Council

Imre Varkonyi's Address

This was followed by an address by Provost Canon Imre Varkonyi, national director of Actio Catolica, and member of the Central Secretariat, who, among others, spoke as follows:

"On the occasion of this most festive, and even intimate occasion, let me be permitted to express my gratitude to the National Peace Council, and to those of its esteemed members who are present today. Thirty years ago the leaders of this organization had the good sense to recognize the significance of establishing a Catholic Committee within the National Peace Council. The existence of this Catholic Committee meant, among other things, that within the National Peace Council every decent human being had the chance to work usefully and effectively in his own area of competence. But beyond this, this deed also made it clear to everyone that the Catholic clergy, or at least the largest portion of that group, did not wish to segregate themselves from the ranks of the average Hungarians, or from the drive toward peace. But above all, it meant that these priests were willing to sacrifice everything in the interest of their country, even if this meant a lack of understanding on the part of many others. We are thankful for this opportunity, and--as demonstrated by our deeds of the past 30 years--we have lived with this opportunity. We are taking advantage of it now, and we intend to do so in the future.

"What are the foundations of our current goals? They are not different today from what they were earlier. These include Pope John XXII's encyclical Pacem in Terris; Pope Paul VI's encyclical Populorum Progressio; Pope Paul VI's speech before the United Nations; his speeches on many other occasions, among them those that were addressed to Hungarian pilgrims in 1972 and in 1975; as well as those historic words that he spoke to Janos Kadar on the occasion of the latter's visit to Rome, and to which the MSZMP's first secretary responded with equal openness, honesty and good will. We think equally highly of Pope John Paul II's speeches made on the occasion of his frequent travels, all of which serve the cause of peace, truth, justice and the progress of humanity.

"Of course, there is no priest, nor can there be one, whose basic ideas in his work toward peace would not have originated from the Holy Scriptures. It is divine revelation that guides even the most exalted of the church leaders. How could we work for peace if we were unaware of what revelation had to say about this fateful question? We are familiar with

the many and often very complex problems of everyday life. But we also know that while holding the questions of everyday life in one of our hands, we have to hold the Holy Scriptures in the other hand. Those are the Holy Scriptures in which God called Cain to account for the spilling of the blood of his brother Abel; those Holy Scriptures in which God is calling every man to account for the life of his fellow man; those Holy Scriptures in which God proclaimed the eternal law: "Don't kill!" (Moses, 20, 1-17)

"Nowadays we are hearing a great deal about the balance of armaments. We, men of peace, have constantly asserted from the very beginning: Let there be an unshakable balance of peace. No weapon, not even the most modern one, can offer full security to even a single man. But the purity of the heart, honesty, belief in the other person, and good will do offer unmistakable and unshakable security to all human beings. When 5 years ago the highly esteemed Helsinki Agreement was signed, everyone believed that this was only the beginning. It was assumed that those human hands that on that occasion had clutched one another would guarantee even more security and strength in the future--not for armaments, but for peace, toward a peace which consists of more than simply the absence of war, toward a peace wherein only those have anything to fear whose goal is to terrorize their fellow human beings, and who dislike peace.

"Another basic foundation of our current efforts toward peace is the constitution of the Second Vatican Synod entitled 'Gandium et Spes.' But what are we going to do in the future?

"There will be a need for the National Peace Council's Catholic Committee for a long time to come. At the time of its quarter centennial--as defined so aptly by State Secretary Imre Miklos--a whole epoch had come to an end, but at the same time another had begun. In this new epoch, the members of the Council of Hungarian Bishops, who are observing the events of the world together with the members of the clergy, do not wish to be simply passive bystanders. They want to participate in the shaping of events in a positive direction. Our hope is that the next 30 years will bring fewer problems for our church and for our country. Our hope is that, under the leadership of our bishops we will always do what is best, most essential, and most expedient. Cardinal Laszlo Lekai often makes reference to various small measures, it is true. But these small measures should always advance the good cause. This is very important. To stop, or to turn back is always dangerous."

This was followed by the appearance of Mrs Nandor Sebestyen, a member of the World Peace Council Presidium and president of the National Peace Council, who greeted the anniversary meeting in the name of the World Peace Council Presidium and in the name of the National Council of the Patriotic People's Front. She emphasized, among other things, that "the Catholic Peace Priests' Movement had done much for the development of a

harmonious cooperation between the state and the Catholic Church, and it had also become a good platform for the dialog between the state and the church."

Following this, Mrs Nandor Sebestyen presented, in the name of the Presidium of the National Peace Council, the Hungarian Peace Movement's Memorial Plaque to the movement for its effective work in the cause of peace. Thanks for this honor was given by General Secretary Canon Imre Biro.

The Address of State Secretary Imre Miklos

After this, it was the turn of the president of the State Office for Religious Affairs to speak. Following introductory greetings he declared:

"A whole generation's time has passed since this patriotic movement of the Catholic priests unfurled its banners in our country. Many of those who have sought the alliance of men and movements of good will that were working toward our country's prosperity--so as to aid this development with a united effort during the pioneering epoch of a new Hungarian social order--are no longer with us. I recall with esteem the memory of our deceased friends. The unselfish work and struggles of the past three decades--which were waged not against something, but rather for something--have produced results. We can rightfully assert that the Catholic Peace Priests' Movement has fulfilled its historic mission. While influencing the social and public attitudes of most of the priests, it has contributed actively to the strengthening of the desire for peace on the part of people of religious convictions, to the continued development of good relations between the state and the Catholic Church, as well as to many positive results of political cooperation.

"In the course of the past three decades, the movement was always capable of self-renewal. The most significant sign of its worthiness is that it can also fulfill its functions today. It not only has a past, but also a present and a future. The defense of peace, and the struggle to enhance the cause of international relaxation have not come to an end. The danger that threatens all of humanity is still here today, 35 years after the most destructive of all world wars. For this very reason, the cooperation and activities of the Peace Priests' Movement is still most valuable today. It should continue to support our nation's struggle in the defense of peace, and for the advancement of its material and intellectual culture.

"The precondition and foundation of all of this is unity and the consolidation of the achievements of the politics of alliance. These are honorable duties and respectful obligations for all of those priests who have remained faithful to our people and to our country. It is this twofold faithfulness that is primarily responsible for having created and for deepening the respect of the nonreligious masses of our society.

"An anniversary affords a chance to look into the future. A respectable and glorious past, and a steadfast and untiringly demanding present also hold promises for the future.

"It is our conviction that the Peace Priests' Movement will be able to continue to fulfill its obligations in the future. We must continue to work so that the conditions of peace and relaxation within the international environment of the continued building of our society should further improve. We will continue to develop the dialog that produces constructive cooperation not only in words, but also in the reality of deeds. The world is being changed and transformed today partially as a result of our labors. Under new conditions, new goals arise. To reach them, we have to find new approaches, in addition to the proven methods. In order to preserve the content of traditional values, we have come up with solutions that are different, but suitable for the changing circumstances and new situations.

"Continued self-renewal is as essential today as it was earlier. And this is impossible without attracting members of the new generations toward the solution of our problems; generations that will take the place of their predecessors. The future belongs to the young--in words as well as in deeds. This future includes within it all that was created by our predecessors, and all that is being produced now by our contemporaries. It is impossible to do without close cooperation between the various generations that follow one another. Only in this manner can we insure the continuation of the fruits of our successful labors, and only thus can we achieve new results.

"The approaching 30th anniversary of the agreement between the state and the Catholic Church, and the upcoming visit to Hungary of the Vatican's secretary of state, Cardinal Agostino Casaroli, as a guest of the Hungarian Catholic Bishops' Council, are both signs of the recognition and of the promising future of that common path that was marked out by the 1977 meeting between Pope Paul VI and Janos Kadar, the MSZMP's first secretary. We wish to continue to follow this path in the future.

"In conclusion, let me greet every participant of this festive conference on this occasion when the National Peace Council's Catholic Committee has been awarded the Memorial Plaque of the Hungarian Peace Movement. Let me also greet separately the new general secretary of the Catholic Priests' National Peace Committee, Canon Imre Biro, who enjoys the trust not only of the church, and of his fellow priests, but also of our state."

PARIS 'KULTURA' EDITOR INTERVIEWED ON STRIKE CRISIS

Paris LE POINT in French 25 Aug 80 pp 50-51

[Interview with Jerzy Giedroyc, editor in chief of the review KULTURA--date and place unknown, interviewer not identified]

> [Text] Jerzy Giedroyc, a Pole, political exile in France, is editor in chief of the Polish review KULTURA, a monthly publication which has been appearing for 33 years in Paris and is disseminated around the world (secretly in Poland). It is one of the most important Polish opposition publications. At the same time, Jerzy Giedroyc is head of a Polish publishing house in Paris.

[Question] What do you see as unique about the present crisis?

[Answer] Basically two things. Remember first of all that this is not the first test of strength. Before 1980, there was 1956, 1970, 1976. Now how were things resolved in 1956? By the return of Gomulka. Remember that he had formidable popularity going for him. At once the strikes stopped, and Poland experienced a wave of hope of which you have no idea. This phenomenon will not recur. Today, no one incarnates hope. The Poles know they are alone. So, they are going to try to obtain the maximum of assurances for the future.

The other novel thing is the incredible political maturity of the strikers. No shouting, no violence, for the time being, not the least attack against party headquarters such as during the last great demonstrations at Gdansk. At that time [1970], the communist regime was confronted by peasants transformed into angry workers. Today, it is a real working class. It calculates and weighs its effort.

[Question] To your knowledge, does there exist a central leadership for the strikers?

[Answer] No. This movement is both spontaneous and coordinated.

[Question] Coordinated by whom?

[Answer] I think that you call that the "Arab telephone." You must understand that the present events are unfolding in a climate of economic crisis and of dramatic food shortages. But this is not all. Do you have an idea of the number of clandestine publications presently appearing in Poland?

[Question] Not the least.

[Answer] Forty-seven. Here, for example, is a copy of ROBOTNIK ["The Worker"]. Circulation: around 50,000. So the present test of strength is rooted in a conflict that is both economic and political.

[Question] What can Gierek do?

[Answer] His freedom to maneuver is very limited. First, there is much debate within the party. As always, there are people who covet his position. Next, the regime is vulnerable to an unsuspected disorder. When the price increases were decided, they were not announced in all of Poland. It was the counterparts of your prefects, the voivodes, who decided whether or not to announce the increases according to the temperature of the local populations. A situation quite incredible in a communist country.

[Question] All the same he has the army and the militia.

[Answer] He has the militia. But, on the one hand, it is not of sufficient size to put down a true insurrection, and, on the other hand, it is hated by the entire populace. As to the army, that is another story. It has only a few days worth of ammunition and fuel in stock (for the Soviets are mistrustful). It is therefore practically useless against the workers. Besides, it would refuse to fire on them. I will point out to you that Polish communist governments have not utilized the army [in the past]. In my opinion, Gierek will not do it.

[Question] Do you think the Soviets will intervene?

[Answer] It seems to me unlikely, now as I speak to you. For several reasons. First, the Soviets have the Afghan affair on their hands. That is already a lot. Then, they do not desire to aggravate tension with the Western countries. Now fighting in Poland--for there would be a true national uprising--would precipitate a global crisis.

[Question] Why? They certainly did it in Hungary and in Czechoslovakia....

[Answer] I am going to tell you a story. During the Prague Spring, Tito went to see Dubcek. He warned him that the Soviets were probably going to intervene. The other replied that he didn't believe it. Tito pressed: [Begin italics] "What will the Czechs do if the Russians send the tanks? What orders will you give?" [End italics] And the first secretary of the communist party, Dubcek, answered that he would give no order, that his country would not fight. That is all. Tito took to his heels.

[Question] And you think the Poles would fight?

[Answer] Yes.

[Question] Do you believe that the Polish army would set itself against the Soviet army?

[Answer] Yes, without a doubt.

[Question] But it doesn't have the wherewithal!

[Answer] We are accustomed to fighting alone and without the means. The important thing is that the Soviet leaders know very well [the truth of] what I am telling you here.

[Question] What is the Church doing?

[Answer] It restrains the opposition and at the same time defends it. Cardinal Wyszynski is as much afraid of Soviet intervention as Edwar Gierek. Both of them think it unlikely, but not impossible. Thus, the bishops are urging moderation to the limit. But the young priests are another story. Everywhere they are committed to the movement. And they are aware of being supported by several bishops, the most popular in Poland, like Monsignor Gulbinovicz or Monsignor Tokarczuk.

[Question] The Pope?

[Answer] I don't know any more than you about that. But it seems to me that the Church, as a whole, can do nothing but sit and watch. It will not get involved except to promote a compromise, if such should see the light of day.

[Question] What sort of compromise?

[Answer] One has to realize that in the end there is a limit to Soviet willingness to abstain from intervention: that, purely and simply, would be the collapse of the Communist Party. That, Moscow could not tolerate. That is to say that the elimination of censorship, freedom of the press, freedom for radio and television, remain abstract goals. The entire system would snap. On the other hand, as long as Poland continues to belong to the Warsaw Pact, as long as the military system of the East remains intact, it seems to me that accommodations are conceivable.

[Question] On what points?

[Answer] The right to strike, and some freedom of candidacy and voting within the official trade unions.

[Question] But if such a system began to function, would that be the birth of a legal opposition in a communist country?

[Answer] Not completely. There could be a temporary equilibrium. But at the same time it would be necessary for people to be able to find food in the stores.

[Question] Are there links between the worker movements and the intellectuals?

[Answer] Yes, in Gdansk, which is the crucible of this novel and significant alliance. Elsewhere, contacts are still fragile.

[Question] In any case the Polish government of tomorrow--Gierek or his successor--is going to need money, meat, wheat, etc.

[Answer] Of course. But it is not the Soviets who are going to supply them to us, since they don't have them. Thus the financial aid and the food are going to come from the Western countries. France, Germany, etc. Why should not a few deputies from the Strasbourg Assembly propose to the Poles, the Hungarians, the Czechs, to come confer with them on the possibilities--however distant, even theoretical--of their countries associating with the Common Market? Financial Assistance from the Western countries, a sort of Marshall Plan, is desirable. But on condition that you strictly control the use of the money. If not, there would simply be several more villas for high officials of the party. It's hard for you to imagine the level of despair and corruption.

[Question] Do you think the Soviets would accept a plan of economic support controlled by the Western countries?

[Answer] Today, in light of the situation, that is not completely impossible. Once again, two conditions: the survival of the party, and Poland's continued membership in the Warsaw Pact.

[Question] There are people who think that the strikes in Poland--"dialog," as L'HUMANITE joyously calls it--are one of the positive consequences of detente....

[Answer] Detente? I do not know what this word means. What is happening in Poland is the product of the courage of the Polish people.

WORKER PARTICIPATION IN ENTERPRISE MANAGEMENT

Bucharest ERA SOCIALISTA in Romanian No 16, 20 Aug 80 pp 19-21

/Article by Honorina Cazacu, Bucharest Sociology Center: "Development of Workers Democracy"/

/Text/ Public activity has not yet received sufficient attention from researchers in the social sciences. Study of it can not only inform us about one of the essential and original directions of the evolution of socialist democracy in Romania but also enable us to develop new concepts and a more comprehensive theory of the evolution of the social and class structure.

If we are to understand some of the implications of public activity from the standpoint of worker participation in enterprise management, we must first know its extent and the forms it takes at the present time. For this purpose we shall use some data from a sociological study now in progress, referring particularly to three industrial enterprises in Bucharest, one very large enterprise (Clothing and Knitwear Enterprise), one large enterprise (Heavy Machinery Enterprise), and one of average size (Automatica Enterprise). (1)

The figures obtained in the course of the study indicate that over 750 party members at the Clothing and Knitwear Enterprise, almost 600 at the Heavy Machinery Enterprise) and over 160 at the Automatica Enterprise are active as members of the RCP bureaus for primary organizations and the party committees for the enterprise and its sections, or as propagandists in political-ideological education. Over 600 UTC /Union of Communist Youth/ youths at the Clothing and Knitwear Enterprise, about 500 at the Heavy Machinery Enterprise and nearly 200 at the Automatica Enterprise are performing their public activity in the elected organs and on the commissions formed by the UTC organizations. The public activists in the economic units to which we are referring are supplemented by about 4,000 members of the trade-union committees and the various commissions, worker control teams, trial boards etc. Between 20 and 30 percent of the personnel of the said enterprises are performing some political-economic, social-professional or ideological-educational work (2). This is a great potential and one of the dynamic forces in the development of the industrial enterprises and consequently of Romanian society in general. It may

be said that alongside such factors as the technical-material base and its development and the organization and competence of personnel, the force represented by public activity and the daily contribution of the public activists in enterprises constitute a factor of great importance to the qualitative changes being made in the Romanian national economy and to the transformation of people themselves.

Structures, Types and Levels of Participation in Collective Management

In practice public activity in enterprises enters into various fields, economic, political, cultural, legal, educational etc., gives rise to many interdependences among people and among organizations, creates new social roles and changes the old ones.

Two main main forms of participation can be distinguished, namely direct participation, including the representatives of public organizations who by their activity take part in preparation of decisions and organize and control their application (for example the members of the party, trade union and youth committees for the enterprise and its sections, the members of the bureaus of these organizations, the workers council, the executive bureau of the workers council etc.), and indirect participation, in which we include those who are active in an organ, commission or collective that does not prepare decisions but provides the collective decision-making organs with results of analyses, recommends measures, controls implementation of decisions, etc.

Of course this distinction somewhat simplifies the actual situations in practical activity. For example, the decisions made by an enterprise's trade union organs qualify both as a form of direct participation in management in the social-professional field and as indirect participation, since they are the trade union's contribution to the application of broader measures adopted, for example, within the party organization.

According to the level of participation in collective management and the field of application of the decisions, we have distinguished three groups in the sociological study we have undertaken, namely the enterprise level, the production section level, and the basic level (production shops).

The organization with the broadest mass base, the trade union, also provides the most public activists. In this stage the fact is also important that according to the findings of the above-mentioned study the direct type of participation in collective management involves about 3 times more persons than the number involved in the category of "indirect participation." As regards the levels of participation, the number of persons increases from the general level of the enterprise down to the intermediate level of the production sections and the basic level of the shops and work groups. The phenomenon is more striking in the category of "direct participation in management" and brings out the hierarchical nature of management along public lines. Indirect participation does not clearly display this characteristic.

To be sure the structures, types and levels of participation in management along public lines also display some qualitative aspects in their

quantitative representation. But the characteristics of public activity are not confined to these and they cannot be correlated without also considering other criteria that cannot be represented quantitatively. It is a matter of the content of the activity and the way it is organized as well as one of the approach, the kind of management, the nature of the relations inherent in this kind of management, the human traits of those active in the public organizations, etc.

As for the content of the public organizations' activity, it is found that the scope of direct participation in management is being expanded primarily by including in the functions the problems of the key sector in the enterprise (production) as well as the social and cultural problems of the working personnel. Law No 5 of 1978 as well as other provisions and instructions specify the forms of organization through which the party, trade union and youth organizations are entitled to participate jointly with the representatives of the technical-administrative management in adopting the decisions and necessary measures in these fields in order to provide for expanded reproduction, improve the professional qualifications of the personnel and to meet their growing social and cultural needs.

Public activity is organized hierarchically: Decisions of the higher organ (the enterprise committee for example) are binding upon those under it (section committees, shop organizations). In its turn the enterprise committee is subordinate to the organs above it, which ensures unity of action and implementation of the principle of democratic centralism. But the hierarchy of the organizations within the enterprise is not a rigid one of the administrative type but a flexible one with many provisions for flexibility and participation of more persons in preparation of decisions, regardless of their position in the hierarchical administrative structure. For example the secretary of a primary party organization or of a primary UTC one or the head of a trade union group can serve on the committee of a production section or on the enterprise committee (In the technical-administrative hierarchy a foreman in a shop cannot be a technical services chief at the same time). Moreover a mere member of an organization can be a member of the enterprise committee etc. The hierarchical structures in this kind of organization are based upon social-political and professional criteria.

Characteristics of Public Organizations and Activists in Enterprises

The public organizations' activity is managed by setting immediate and long-range objectives. The long-range view in judging present situations is an increasingly urgent requirement today because the future is made of the present to a great extent in a national economy whose goals are determined on a long-term basis as they are in Romania.

The approach and the nature of the relations among the members who belong to the managements of the higher and the primary organs are not like those of a chief to a subordinate. Since the decisions are made by consultation and agreement, their implementation is not the prerogative of the "executives" but of all, whether they belong to a higher administrative organ or to an intermediate or primary one. Since the discipline is freely agreed upon in

accordance with the organization's regulations, it is ordinarily secured by informal means (critical analysis, self-criticism) and only in extreme cases by sanctions which, however, are political and not administrative in nature.

Because of the type of organization, the type of management, the approach and the nature of the relations among the members who make up the public organizations, the latter are flexible, their initiative in decision-making is growing, and more persons are participating in preparation of decisions regardless of their function in the respective organ or hierarchy.

The correlation of state management with the public kind of management, as practiced in the industrial enterprises, makes it possible in the long run to improve both types of management, especially as regards the working methods and approach. For example such qualities as flexibility, innovation, freedom from bureaucracy etc. that are generally characteristic of the public organizations, as well as such qualities as organization, precision, tight control of task fulfillment etc. characteristic of the technical-administrative kind of organization, can be blended in a new synthesis contributing to the greater effectiveness of management operations on both the economic and the political, social and cultural levels. But at some points there can also be a risk of transferring negative characteristics like red tape, irresponsibility, bureaucracy, lack of control, lax implementation of tasks or internal decisions etc.

The roles of the public activists in the industrial enterprises have several main characteristics. Public activity involves a particular kind of role, namely those assigned by society to certain of its members according to their professional-human and political-ideological capabilities. As distinguished from other roles assigned by people themselves (professional role, family role etc.), the roles of the public kind of management are assigned by others, especially the labor collective, by election or appointment to a given public body. Sometimes the two methods are combined, when the appointment is subject to the approval of the community. This stage is characterized by a decreasing proportion of appointments and a growing proportion of elections of persons for a given role in the public organizations. Nevertheless the community sometimes errs in assigning roles because of some disturbing factors (pressure groups, diverging interests, inability to know etc.).

The increased proportion of elections in a community's assignments of public management roles involves a certain type of interdependence among the members of the organization, namely the right of the voters to control the person they have entrusted with a given role and the obligation of the holder of a management role to be primarily responsible to the colleagues who elected him to that role. The intensified mutual interest in fulfillment of the assumed obligations enhances the solidarity of the respective community.

Assignment of this kind of role for a limited time is another characteristic of the operation of the public bodies. In an organized fashion and at given time intervals, starting at the bottom and continuing through the sections in the big enterprises and on up to the enterprise level, the activity of those who have performed public management roles is analyzed and rated by reassignment of the respective role, by promotion to a more responsible role, or by

withdrawing the previously assigned role and entrusting it to another person. This periodicity not only eliminates the opportunity for bureaucratic habits to become entrenched but generally humanizes relations between those with management roles and those without them and makes management roles accessible to more persons.

All the public roles are without pay, except for one or two persons in the big enterprises who are withdrawn from production, namely the secretary of the party committee and sometimes also the chairman of the enterprise trade union committee. Working directly in production, in shops and sections where they have the same tasks (and consequently the same wages) as others with their qualifications, the members of the various public bodies have direct knowledge of the actual problems, situations and states of mind. They can consult directly with those who elected them and make proposals knowledgeably. The decisions they make in the collective management organs to which they belong are equally binding on themselves.

Expansion of public activity in enterprises and the growth of its functions also make structural changes in the roles: One and the same person performs a composite role, that is he performs subroles of different kinds at the same time. A worker who is also the secretary of an RCP primary organization in a factory performs both the role of a producer and that of a political manager. He performs a certain kind of activity and has, essentially, one kind of responsibility in the first position and another kind of activity and responsibility in the second one. The first role is relatively permanent and the second one is for a limited time. An engineer who has the same political role as the worker in the foregoing example also performs a composite role. These structural changes in some traditional roles result, among other things, in some new contradictions and require many changes in the system of interdependences in the industrial enterprises and, on a broader scale, in the social structure.

On the basis of the studies made we can formulate some of the main characteristics of the personality of the public activist in the industrial enterprises (also insufficiently studied in the previous technical literature). It can be said that personalities characterized by a creative spirit and optimism are appointed to and play an active part in these roles, those who are determined and forceful, enthusiastic and demanding, those who can dedicate their time, thought and inventiveness and are capable of personal sacrifices, and those who are resolved to act in disciplined fashion to achieve immediate and long-range general objectives.

As to the structure of these public management roles, as well as the interdependences brought about by their existence (problems still inadequately studied in our technical literature), we can say that they are highly complex and have many implications for the personality of the individual.

Under self-administration and workers self-management there has been a greater interdependence between the general interests and each worker's personal ones. At the same time, the relations between the two kinds of interests are more

direct. In the institutionalized forms of participation in management that are now operative in the industrial enterprises, the right to make decisions and to organize and provide for their implementation ultimately means a greater ability on the part of the persons integrated in these bodies to knowledgeably determine a certain way of life for macrocommunities and microcommunities.

Organization of the most comprehensive system of functional structures of collective management and discovery of new and efficient methods of worker participation in the management and administration of the units (extensive processes to which research in the social sciences is expected to make a greater contribution) conform in their content and social implications to the firm directive handed down by the RCP to intensify and perfect socialist democracy.

CONTINUING NEED FOR ATHEISTIC EDUCATION STRESSED

Bucharest ERA SOCIALISTA in Romanian No 16, 20 Aug 80 pp 29-31

/Article by Dr Vasile Sporici: "Scientific-Materialist Education of the Masses as a Major Aspect of Culture"/

/Text/ Throughout all history there has been a constant effort to free man from the tyranny of superstitions and sacralizing prejudices. His modern culture is a sublimation of the continuous flow of refinement of the humanist values and the relentless struggle with the subjective and objective factors of obscurantism.

As a form of social consciousness, religion is the product of specific conditions of social existence. The idea of supernatural power is not innate but caused like any idea by a series of objective external factors, and religion has not always existed but appears at a certain lower (but not very early) stage of development and will disappear at a higher stage. Comrade Nicolae Ceausescu said, "Of course religion appeared in a certain historical stage of social development, when men could not understand a number of phenomena and raised their eyes to the sky expecting the answer. They received the answer in one way or another, according as the ruling classes of the time thought it should be given. We, the communists, know that the world was not created by any higher divine power and that no one stands anywhere and directs how society is developed and how man's life is organized."

In general the religious consciousness is formed under the influence of living conditions. This Marxist principle has been confirmed by modern studies in genetics, from which we briefly cite some significant findings. For example the theory of the American geneticist Ernst Mayr explains the sacralizing attitudes (not only religious but also lay) by natural selection in the small groups of primeval hominids, exploiting the innate capacity to retain and include in chromosomes (and consequently to make them transmissible by heredity) various standards of conduct, including some moral and religious ones, capable of fixing and perpetuating information advantageous in the struggle for existence. Although it biologizes the social aspect of human evolution, this view nevertheless has the merit of unmasking and eradicating the sacred aura of

religious feeling which, so far from being innate, unique and irreducible as the theologians claim, has proved to be an attitude and a form of behavior acquired under the duress of living conditions, that is in a quite natural way.

With certain inconsistencies, the problem is taken up in similar terms by Jacques Monod, laureate of the Nobel Prize for Medicine, in his well known and much discussed book "Le Hasard et la Necesssite." He finds that through the evolution of the higher nervous system the pressure of selection, which had dominated the first stages of human development, began to decline, so that man could expand his domination of the nonhuman world and gradually free himself of the reign of terror inspired in him by the dangers of everyday existence. No kind of religious feeling developed in the first stages of the hominids' evolution, which are also the longest ones.

Neither the need nor the power of the laws intended to organize the indispensable cohesion of the tribe, which became a factor in selection and survival, made itself felt until later, when human destiny began to be identified with that of the tribe. Monod states, "In view of the immense selective significance assumed by certain social structures over such vast periods of time, it is hard to believe that they did not affect the genetic evolution of the innate categories of the human brain. This evolution must have not only facilitated acceptance of the tribal law but also created the need of the mythical explanation that substantiated it and lent it sovereignty. Unquestionably we inherited from them... the terror... that creates myths and religions." (1)

Unfortunately these scientific suppositions, which place the sacralizing phenomenon in a definitive natural-historical context, are accompanied by speculative considerations with no scientific basis that even contradict previous points of the author's. For example, the French scholar rightly states only a few lines above that the "need" (in fact the specific "social" necessity) of mythical explanations appears at the end of a long human evolution, in the framework of the tribal communities and as a result of a complex determinism as the natural factors merge with the incipiently social ones, yet he paradoxically concludes, "Personally I do not have the slightest doubt that this imperious need is innate, inscribed somewhere in the language of the genetic code, and that spontaneously developed." (2)

The generalizations like Monod's are preceded by the findings, based on investigations, of some American geneticists interested in the relationship between "cultural determinism and natural selection. (3) They proceed from the fact that very little is known about the limitations of genetic flexibility when confronted with environmental changes. But it is known that man compensates for lack of genetic specialization in this area by his skill in learning to change his behavior, so that this trait will itself become a factor in selection through a complex feedback. The authors conclude that two kinds of heredity, genetic and cultural, develop in man's evolution and that their interaction accompanied by man's ability to learn can be regarded as the main cause of his evolution.

This is similar to the theory of the Soviet geneticist N. P. Dubinin (4), who takes up the problem of interaction between the genetic and social factors in

determining human attitudes and ideas and describes it as the interaction between the genetic and social programs. In this way, without overlooking the distinctions between the two kinds of programs, he also includes in the discussion the concepts of new "exact sciences" like cybernetics, the information theory, bioengineering etc. that can attract further attention to the informational and thereby integrating determination of the human consciousness.

The great gains of science constantly confirm the Marxist ideas about the rise of religious belief against the background of men's distorted representations of the surrounding world and their own nature. The evolution of thought and the modern disciplines concerning nature and society created what is called the paradigmatic antidogmatism of modern culture. Hence the old Augustinian adage which, in an attempt to reverse matters, maintains that any knowledge is based upon a belief appears as an unsuccessful witticism from the present point of view.

The need of all-around socialist education is more urgent than ever today, and it is accomplished by forming a personality open to all the factors that make for man's awareness through more and more emphatic assertion of the values of militant socialist culture. It should be said that scientific-materialist education in Romania would be far richer in content and achievements and would prove far more effective if due attention were given to the formative values of art by bringing out its great antireligious resources and its disalienating capacity. Moreover it has been noted in our technical literature that the secular and atheist phenomenon is treated hardly or not at all at times as an aspect of literary-artistic culture and the militant potentials of a more direct approach to human behavior and awareness are underrated.

Of course in working with myths, with misleading emotional halos and with ineffable conditions that reason can take no account of, art and the "miracle" of artistic creation are in the vicinity of feelings open to sacralization. Hence the involuntary tendency of some experimentalist exaggerations to conform to a trend of nonsacralization of human relations and of mystification of life, the daily manifestations of which are excluded from the field of interest of artistic transfiguration.

But are we all that helpless before the crisis phenomena of modern art? The process of restoring humanist legitimacy in artistic creation can and must be expedited where the need is felt by a united initiative of recommending reconsideration of the tools and of refining or rediscovering the creeds. But let us note that in Romania too such fields of analysis and orientation of artistic creation as aesthetics and literary criticism sometimes prove insufficiently interested in the educational function and the civic values of art. They seem too concerned with "initiatic" personalization instead of integration of the artistic act, probably considering "integration" a depersonalization instead of what it actually is, namely commitment to high revolutionary ideals. Such effective means as art and humanist culture in general have of helping to promote our advanced conception of the world are sometimes underrated. And do we not recognize a reflection of this attitude when we explicitly attribute the quality of "scientific" alone to the atheism of today and to atheistic

materialism in general? The educational function is present in all components of our socialist ideology, whether they are of scientific or sultural-artistic origin. The complementary quality of the scientific-technical and humanistic components of the consciousness of the new type of man is essential to formation of sound atheistic convictions, and their effectiveness can make the atheistic propaganda media more flexible. When we add experience to these two aspects of the personality our socialist order is forming (the scientific-cognitive and the value ones), we have the essence of the consciousness that is being purposefully formed and which we can firmly commit to the demystifying effort of self-rediscovery.

The RCP's official stand against religious obscurantism and mysticism is well known. In the first years after its founding the party adopted a principled attitude toward religion, avoiding both conciliatory opportunism and leftist excesses. The RCP's attitude acquired a clear formulation in the Program for Building the Fully Developed Socialist Society and for Romania's Advance Toward Socialism. Avoiding administrative methods as well as ideological passiveness, the party pointed out that materialist education (scientific and cultural alike) cannot deceive itself to the effect that as a remnant of the old religion will automatically disappear, that as a result of scientific-technical progress religious indifference will inevitably follow, or that because of the social, revolutionary commitment of the builder of the fully developed socialist society his consciousness will readily assimilate all principles of the dialectical-materialist conception of the world and life. Journalism often still treats commitment, militancy and human responsibility abstractly, sometimes forgetting that they all involve the specific human individual and the life of the microgroup that includes him and in which not only historical problems but also everyday questions arise, which he must wish or be able to resolve on his own responsibility. In this connection it can be stated that proper functioning of democracy in the life of a commune, enterprise or collective or a real assertion of the workers' capacity as owners, producers and beneficiaries is also an act of scientific-materialist education by virtue of its profound political implications.

It is not only the individual's civic commitment that is important, but also his effective participation in the decisions that directly concern him, which will strengthen his self-awareness and invigorate his personality. Formation of an atheistic-materialist conception of the world involves people's conviction that it is in their power (both as members of a collective and as separate individuals) to solve not only new problems but also those they encounter at every step. Marx mentioned that religious alienation, the "social negative" as such, contains much more complex determinations than the mere membership of the individuals (or nonmembership, we add) in the oppressed class.

Under social changes of such proportions as those going on in Romania (because of the revolutionized socioeconomic and demographic structures and the rapid urbanization of the nation), the "uprooted" attitude appears at points of a man who is no longer what he was and has not yet succeeded in becoming what society demands of him nor what he himself intended. There are still quite a few who prefer to seclude themselves and to transform what is usually only an

ordinary administrative case of everyday experience into an overwhelming tragedy. And it is only a step from here to the obscure belief in an "inherent justice" in the solution of the problem and the sanctioning (miraculous) of the guilty party. To be sure our society ultimately resolves such cases, but it should not be regarded as a force whose powers are to be implored or awaited with resignation.

Education has a decisive role in this regard on many levels. Including the major requirement of forming a revolutionary, scientific-materialist awareness among the aims of socialist cultural development has proved a salutary measure, and crystallization of the civic consciousness in keeping with the requirements of everyday life, in our society so demanding upon every member of it, can only be encouraged. This requires a more consistent effort toward civic education and elimination of the deficiencies in involving people in actions that will integrate them naturally in current existence and cultivate in them a clear, specific and efficient approach to life. The inevitability of some shocks from the impact with truly or falsely complicated circumstances of life because of the bureaucratic or merely incompetent attitudes of some elements can lead to divisions of the consciousness and to sensitizing less stable natures to the temptation to consume the religious "opium," called upon to create the illusion of banishment, as a deus ex machina, of the inherent or artificially created difficulties.

I think we should note that among the cultural-educational and artistic genres taken up at the National Cintarea Romaniei Festival those devoted to the scientific-materialist education of the masses are often unconvincing and still contribute too little to formation of the civic consciousness capable of resisting the above-mentioned temptations. Too rarely do we see on the stages of the cultural clubs artistic propaganda brigades with subjects "borrowed" from the intellectual life of the contemporary village in which the manifestations of so-called respect for the "customs" (as a rule actually meaning practice of the theist cult in various forms and aspects most often at variance with the aims of formation of a socialist consciousness) are satirized or simply rejected as anachronistic.

It is desirable for professional art to take up the subjects with a scientific-materialist purpose on a higher artistic level and with power of conviction. The performances produced on some stages with dramatic works intended to combat mysticism or irrational beliefs are usually considered "service" performances and their exclusive scheduling on the stages of the cultural clubs (generally for tours) sometimes leads to deterioration of the artistic quality, which can only impair the quality of the message and its power of conviction. Artistic exploitation of certain secular myths is an act of desacralization and legitimate restitution of some spiritual goods to those who conceived them at their source, and from this viewpoint the artistic measure can only be encouraged. But it should also be channeled toward demystification of the hypocracy on which some styles (of unquestionable and no less reprehensible snobbery) border, consisting of disregard of the fact that "secretely" or not one form of cult or another is practiced alongside us. The writers have a great role in forming a mass attitude against the various manifestations of

theist irrationalism, helping to cultivate a humanist ideal older than any "custom" or any mystic "tradition," and it depends on them alone to make this a style that is as convincing as possible.

The truth is that the fully developed personality is both an ideal and a process and that man is infinitely perfectible, while the temporary defects should not lead to acceptance of his present weaknesses. There are cases where psychomoral processes that appeared irreversible have undergone distortions that the general principles and abstract truths could hardly explain. The directions of individual development are not always irreversible, and the most hidden moral defects can show surprising relapses. Therefore constructive social action must be accompanied by tireless cultivation of the formative-educational effort, which will strengthen interhuman solidarity and the individual's assurance that the things around him are meant for him, that he dominates them and that he is not dominated by the structures in which they are constituted. All the other spiritual forces that will help to crystallize the new type of human personality, with sound materialist-atheistic convictions, should be rallied in support of the material and political values that activate the inner resources of man and society.

POLISH BOOK ON ROMANIAN ART CRITICIZED BY IASI PAPER

Iasi CRONICA in Romanian 15 Aug 80 p 8

[Article by Veniamin Ciobanu: "Art and Historical Truth"]

[Text] The intensification of international relations, including tourism, calls with ever greater urgency for the appearance of certain works capable of offering a quick and efficient means of providing information about the most important aspects and moments in the history of a people, as seen in their centuries-long correlations. Such a necessity is even clearer when we are speaking of a country and a people whose historical evolution has numerous common traits imprinted with their direct contacts on multiple levels throughout the centuries. This is the case of the Romanian and Polish peoples. In such a situation, the mutual interest in the history of art and culture also bears the imprint of the natural desire to understand the purest reflex of their spirituality. The work to which we will refer was also directed to this end.*

The authors dealt with the theme they had proposed, Romanian art from the 13th century to the beginning of the 20th century, in the framework of five major chapters, with each one being divided into sub-chapters according to chronological and thematic criteria, as follows: The Art of the Romanian Countries; The Art of Moldavia; The Art of Transylvania; The Art of the 19th Century and the Beginning of This Century; Wooden Architecture, Village Structures and Popular Art. The first and last chapters were written by Ryszard Brykowski; the second and fourth by Tadeusz Chranowski; and the third by Marian Kornecki. The work also contains a Forward from the Authors and an Introduction, constituting a short review of the evolution of art beginning with the primitive commune

---

*Ryszard Brykowski, Tadeusz Chranowksi, Marian Kornecki, "Sztuka Rumunii" (The Art of Romania), Wroclaw-Warszawa-Krakow-Gdansk, Publishing House of the "Ossolinski" National Institute, 1979, 207 pages plus illustrations and the map of Romania.

up through the end of the transition period to feudalism, written by Tadeusz Chranowski. The work also has Bibliographic References, a Small Dictionary of Terms that are used in the work, an Index of Personalities, an Index of Locations and Monuments and a List of Illustrations in and outside the text, as well as an impressive number of black-and-white illustrations and a map of Romania.

With the work, first of all, being especially designed to familiarize certain broader circles of Polish readers with the history of Romanian art and the historico-artistic Romanian problem, at the beginning of each major chapter there is a brief look into the history of the province under study during the particular chronological period, accompanied by a succinct geographic description. That such a presentation was absolutely necessary no longer has to be demonstrated since it is a well known fact that the correct understanding of the historical evolution of a people also depends upon the just understanding of its spiritual evolution, given the close interdependence between these two factors. But, precisely some of these short paragraphs contain a series of inadvertent elements that can lead the people for which it was designed to make erroneous conclusions regarding the history of the Romanian people and, implicitly, the significance of its art.

Thus, great bewilderment is stirred up the the authors' statement that "the few archeological discoveries from the era of the migrations of various peoples, which in this territory [Romania] extended until the 12th century and which are not tied together in an evolutionary course, do not succeed in illustrating and, even less, justifying the unusual phenomenon that the Romanians, despite the invasions of different populations and their isolation within the Slavic and Hungarian territories, preserved until our time a language directly derived from Latin" (p 9). The conclusion that springs from this sentence is that the authors did not have appropriate scientific documentation available. Numerous archeological discoveries from the age of migrations, the result of certain broad and systematic reserach undertaken by Romanian archeologists throughout the country that have been validated in numerous monographs, collections of archeological discoveries, studies and articles published in specialized Romanian and foreign periodicals, categorically refute such a statement.

The undifferentiated approach to the particular factors of the historical evolution of the Romanian people and the coinhabitating nationalities led to another unsubstantiated finding, in the sense that "all these monuments that were built on Romanian territory as a result of the activities of non-Romanian social groups, and first of all the monuments in Transylvania, belong to a branch of the Latin culture" (pp 9-10). The fact that not all of the monuments in Transylvania are the creation of certain "non-Romanian social groups," as the quoted sentence wants to suggest, is demonstrated by the presentation of Transylvanian art in this book. Along these lines, we should remember for its significance

the statement made by Marian Kornecki that the art of Transylvania must be regarded in its entirety since it does not exclusively belong to "any one of the principal sources that created it" (p 99). Let us merely add that some, and not some of the lesser important, Transylvanian monuments were also built by the master craftsmen from Wallachia and Moldavia.

Especially serious reservations stem, however, from the historical considerations found in the fourth chapter. Thus, the "basic" territories inhabited by Romanians are not just Wallachia and Moldavia, whose complete unification occurred in the 19th century, but all three Romanian provinces, in other words including Transylvania. Later, in Romanian history, the principal connection of 1821 must be made with 1848, with the connection made by the author with 1828-1829 (the Russian-Turkish War) being of lesser importance. It is true, from the point of view of state membership, that Transylvania had a separate path in relation to the other two Romanian provinces. What is important, however, is the unity of national awareness of the Romanians on both sides of the Carpathians, a fact ignored by the author of this chapter. In Transylvania, there was the revolt led by Horea, Closca and Crisan, one of the most powerful social revolts in Europe and one which also had a clearly national character. Also in Transylvania, the "Transylvanian School" was born and the two "Supplexes Libellus Valachoram" (1791 and 1804) were drawn up. In other words, the basis for the Romanian national ideology were laid there, with the program for the struggle for national emancipation remaining valid until the Unification in 1918 (with some of the principal reasons being the revolutionary year of 1848, the creation of the National Romanian Party in Transylvania, the memorandist movement in 1892-1894 and so forth). Throughout this period, the contacts between Transylvania and Romania (considered as such after the 1859 unification) were permanent and profound since the supreme goal was a common one: the completion of state unification. Also especially grave is the error of considering the unification of Transylvania with Romania merely as an act resulting from the Peace Conference of Versailles. As a result, they avoided the well known fact that the Unification was a product of the free expression of the desire of the Romanian Transylvanians, finalized in a formal act that bears the date 1 December 1918, completed by the equally free expression of the desire of the coinhabitating nationalities. As a result, the Peace Conference of Versailles and the international documents that were concluded in the spirit of its decisions did nothing more than to sanction a completed act, the result of a long historical process.

It is not, therefore, surprising that such an approach to the political history of the Romanian people in the 19th century would also have repercussions upon the manner of interpretation of Romanian art during that period. An insufficient look into the problems that troubled Romanian society during that time prevented the authors from uncovering the profound patriotic significance in many of the works of art (created both by

Romanian and foreign artists, as far as their ethnic origin is concerned, but who fully identified with the desires and aspirations of the people that had adopted them) and sometimes even slighting them. It is in itself understood that such a distorted view only partially serves the principal objective of the book: the understanding of a long and complex historical and esthetic process by the Polish reader.

Naturally, we did not lose sight at any time of the fact that this volume that we have presented is not a work of historical research. We understood very well the authors' purpose. To a large degree, the purpose was fulfilled, since, first of all and a very important fact, the work serves the secular desire that is today of great interest in giving a better, mutual understanding between the Romanian and Polish people. Precisely for us to also make a modest contribution in the service of this goal, we have paused upon certain questions that bring together the historical sphere, being convinced that the alteration of fundamental historical truths is damaging. As a result, our critical observations have no other purpose than to eliminate errors and promote historical truth.

FOREIGN HISTORIANS' VIEWS OF ROMANIA EXAMINED

Iasi CRONICA in Romanian 8 Aug 80 p 10

[Article by L. Boicu: "The Urgent Need for Mutual Understanding"]

[Text] The 14th International Congress of Historical Sciences, which took place in San Francisco between 22 and 29 August 1975 and which selected Bucharest as the host city for the 15th Congress, also has, among other things, the great credit of having eliminated Europe-centrist exaggerations, defining in precise terms the place of history in the contemporary world and the responsibilities of the historian and urging collaboration and mutual respect -- the the only way compatible with the virtues of science and the moral requirements of a world seeking its own security.

Collaboration and mutual respect are two elements capable of being the most prominent characteristics of the relations between the historians and the historiographies of the socialist countries, for reasons dealing with the doctrinal principles that govern their interstate relations. One can add to this, however, an important consideration: the geo-political one, the relations in the zonal-geographic plane. Romania is a neighbor with four socialist countries. Among them, and not just among them, there are ample and vigorous historical differences. Respecting and cultivating the individuality of their own country (in the noblest sense of the word), historians feel the urgent need for a mutual understanding of their profession and the need for collaboration as a condition for success.

The geographic amd historico-political coordinates of the territory inhabited by the Romanians, their ethnic origin and language, the juridico-political international statute of the Principalities and, later, of Romania until the gaining of independence in 1877, the place and role of our country in foreign events in the modern and contemporary eras, its original contribution to the cause of civilization and so forth require the researcher to undertake specific concerns stemming from the particular nature of the historic Romanian phenomenon.

Today, more than any other time, the study of Romania's history abroad has gone beyond the phase of the casual, spontaneous and only personal document. In universities and institutes of higher learning, the history of Romania occupies a distinct place in the history of the Southeast European countries, a region that constitutes a research material of an independent nature. There is an "International Association of Southeastern European Studies" which operates with remarkable results and which regularly organizes congresses and publishes discussions in massive volumes that give rise to the liveliest interest. In the majority of the socialist countries there are specialized institutes for Southeastern European research. They publish magazines such as BALKANSKII SBORNIK (Moscow), ETUDES BALKANIQUES (Sofia), JAHRBUCH FUR GESCHICHTE DER SOZIALISTISCHEN LANDER EUROPAS (Berlin) and so forth, in which the reader finds contributions dedicated to the history of Romania, especially the history of its international relations. In this regard, an important role is played by the "Institute of Southeastern European Studies" (Bucharest), with its periodical REVUE DES ETUDES SUD-EST EUROPEENNES.

In the spirit of fruitful collaboration, volumes were published, with bilateral participation, on the history of Romanian-Russian, Romanian-Bulgarian and Romanian-Hungarian relations. Under the same auspices, there is also a record of the anniversary of the winning of Romania's state independence. Tzenko Ghenov is the author of the work "Po boinia pat na osvoboditelite 1877-1978" (On the Battle Path of the Liberators 1877-1878), Sofia 1976, in which C. Velichi states "more attention is given to the Romanian participation in the war than in other general works that have appeared to date in Bulgaria." The Soviet publishing house "Nauka" published the reports presented at the international conference in Moscow under the title "100 let osvobojdenia balkaniskih narodev ot osmanskago iga" (One Hundred Years Since the Liberation of the Balkan Peoples from Ottoman Domination). In this volume, there are three Romanian reports, and not a few others dealing directly with Romania. Despite the persistence of a certain trend to idealize the foreign factor, the role of the smaller Balkan populations is well presented. Professor C. Velichi and V. Vrajkov completed in 1979 a joint monograph dealing with the Bulgarian emigration to Romania in the 19th century and the role it played in the national rebirth of Bulgaria.

In the period between the 14th and 15th international history congresses, a very useful collaboration was intensified between historians and specialized institutes in the socialist countries: periodic discussions dedicated to the improvement of history books and discussions designed to eliminate inaccuracies and to cultivate mutual understanding and respect. The Romanians have thus engaged in these types of discussions with all the European socialist countries. We are now awaiting the results.

The Polish historian Juliusz Demel published in 1979 in Wroclaw a well-received "Historia Rumunii" and Soviet historians in 1971 published two volumes (for the period 1848-1970) in the projected "History of Romania." A promising start that appears to have been interrupted.

The same fan of Romanian history, Juliusz Demel, published the first monograph by a foreigner about Cuza Voda: "Aleksander Jan Cuza Ksiaze Rumunii" (Alexandru Ioan Cuza Prince of Romania), Ossolineum, Wroclaw - Warszawa - Krakow - Gdansk, 1977, 246 pages. The Polish historian successfully presents one of the most beautiful and accurate portraits of this ruler. It shows in Ilie Corfus' translation: "from the contemporary records that have been preserved, which are not too numerous or extensive, we get the picture of a young man, of middle height, well-built, handsome, with a delightful exterior appearance. A face with steady, manly lines, a prominent nose and mouth, blue-green eyes, shining hair lightly curled. A polite, elegant manner, a casual, friendly behavior. He was characterized by a lively intelligence, an ease of expression, a quick and biting responsiveness, a person not lacking irony, frequently ardent since he did not like to hide his opinions. He had a sincere, brave nature that was foreign to hypocrisy, greed and the desire to succeed at others' expense. In addition to this, he had an active nature, filled with energy, mobility, spontaneity that was hostile to pompous, rigid ceremony." It is fitting to note that in all his works dedicated to the history of Romania and the history of Romanian-Polish relations, Juliusz Demel exhibits an admirable effort for objectivity.

Despite certain errors not lacking an element of partis-pris, the history of Romania is also satisfactorily presented in the dictionaries and encyclopedia in the socialist countries, beginning with "Sovietskaia istoriceskaia enticlopedia," which appeared in 1971.

A role of the greatest significance in the spread of the history of the country and in the development of collaboration between historians is played by the joint commissions on history, such as the Romanian-Bulgarian, Romanian-Yugoslav, Romanian-Hungarian, Romanian-Czechoslovak, Romanian-East German, Romanian-Polish, Romanian-Soviet and so forth. These commissions periodically meet to discuss problems of common interest for the purpose of mutual understanding, and the results merit the full consideration of the historian.

It would be unrealistic, however, and even damaging for us to draw the conclusion that Romanian historiography abroad, especially in the socialist countries, has reached a high and correct level of representation. In this aspect, there is much to be done. Circumstantial obstacles still spring up, and not a few of them have their source in the confused history of this part of the continent. Nowhere was history a series of summertime relations between the people and the rulers. It was not so in Eastern Europe. Some contemporary historians have a difficult time setting aside

false dogmas that have a multi-century tradition, and they have a narrow or incorrect comprehension of the general and particular interests and truths, which explains the regrettable disagreements in the writing of history. Unfortunately, Romanian historiography is also confronted with false problems. For those who wish clarifications, allow us to recommend the critical reactions of Petre Diaconu in the documentary series published in REVISTA DE ISTORIE, beginning with issue No 6, 1976, and Const. C. Giurescu, under the title "Raspus la 'nitel descintec' al unui vraci" (A Wizard's Response to a 'Little Spell'), in the same publication, issue No 8, 1976.

Naturally, the confrontation of opinions in science is defined as an organic implication that becomes well-meaning only if it is constructive. Despite the deviations, which characterize the relations between the historians and the historiographies of the socialist countries there is a desire and effort aiming at collaboration and mutual respect. We have every reason to hope that this will also be the spirit that will preside at the 15th International Congress of Historians, 10 to 17 August 1980 in Bucharest.

LAW ON 1981 CENSUS ADOPTED BY SFRY ASSEMBLY

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 41, 25 Jul 80 pp 1324-1327

[Law adopted by the SFRY Assembly in a session of the Federal Chamber on 17 July 1980: "Law on the 1981 Population, Household and Housing Census"]

[Text] Article 1

A census of the population, households and housing units (hereafter referred to as the "census") shall be taken from 1 to 15 April 1981 in the Socialist Federal Republic of Yugoslavia.

The census shall be done as of 2400 hours on 31 March 1981.

Immediately after the census is taken, a statistical check shall be run on the quality of the data gathered in the census.

Article 2

The census shall embrace the following:

1) citizens of the Socialist Federal Republic of Yugoslavia, foreign nationals and stateless persons who have their domicile in the Socialist Federal Republic of Yugoslavia regardless of whether they are in the Socialist Federal Republic of Yugoslavia or abroad at the time of the census;

2) households of the persons referred to in Subparagraph 1 of this paragraph;

3) dwellings and other space in which people are living.

The census shall also cover citizens of the Socialist Federal Republic of Yugoslavia, foreign nationals and stateless persons who have their domicile abroad and who at the moment of the census happen to be in the Socialist Federal Republic of Yugoslavia.

As an exception to the provisions of Paragraphs 1 and 2 of this article, the census shall not cover diplomatic personnel of foreign diplomatic and consular missions and members of their families and the dwellings which are the property of foreign states.

Article 3

Data on the following shall be gathered on the persons covered by the census: last name and first name, name of the place (settlement) and opstina where they live or are temporarily staying, working or attending school; the reason for absence from the place of permanent residence or for their presence at the place where the census was taken; sex, date of birth, place of birth (settlement and opstina) and marital status; nationality, ethnic minority or ethnic group; native language, literacy, schooling, whether or not attending school; number of children (live births), settlement and opstina of origin and the year of resettlement; occupation; occasional performance of other jobs to earn a living, socioeconomic status, activities and sources of income.

In addition to the data referred to in Paragraph 1 of this article, the following data shall also be gathered in the census:

1) on persons with permanent employment--data on the corporate name or title and registration number of the organization of associated labor and other organization or community as well as of the constituent unit in which they work, the level of their specialized education, how often they travel from the place where they work to the place where they live, and the amount of time they work away from the place where they live;

2) on secondary and postsecondary students attending school outside the settlement where they have their permanent residence--data on how often they return to that settlement;

3) on citizens of the Socialist Federal Republic of Yugoslavia abroad--data on the name of the state where they live and on the time spent working for a foreign employer or in self-employment;

4) on citizens of the Socialist Federal Republic of Yugoslavia abroad who returned before the census from employment with a foreign employer or self-employment abroad--data on time spent in that employment from 1965 up to the time of the census.

Article 4

Data on the following shall be gathered in the census of households: last name and first name of the person in whose name the household is recorded, members of the household and other persons residing in the household or happening to be in it at the moment of the census, and also the name of the settlement and street address where those persons do reside or happen to

be; the relationship of the various members of the household to the person in whose name the household is recorded; the legal basis for use of the dwelling, ownership of a building or dwelling for rest and recreation; existence of a well in the yard; business collaboration of members of the household with an agricultural cooperative or under other forms of association of private farmers or with an organization of associated labor; the area of own land, used land and arable land and principal data on the livestock herd, poultry, beehives, tractors and combines.

Article 5

In the census of housing data shall be gathered on the name of the settlement and street address where the dwelling is located; the floor area of the dwelling and the number of rooms, whether the dwelling has a kitchen, wiring and plumbing and toilet and bathroom, ownership of the dwelling, use of the dwelling (for residence, for rest and recreation, for conduct of a business activity), the story on which the dwelling is located, year of construction, type of building and material of the building's outside walls.

Article 6

An individual included in the census must give accurate and full answers to all the questions contained on the census forms.

Data on absent members of the household shall be furnished by the member of the household who is most familiar with such data, and on children under age 15 by one of the parents or guardians.

A person included in the census need not declare his nationality, ethnic minority or ethnic group, and the census form must contain a notice to that effect.

Article 7

If at the time of the census the censustaker does not find a person included in the census at home, and he is unable to gather the data in the manner envisaged in Article 6, Paragraph 2, of this law, he shall leave a written notice that that person must report to the competent agency by 20 April in order to furnish data related to the census.

Article 8

A basic and other organization of associated labor, an association and community of organizations of associated labor, a contract organization of associated labor, a bank, a community for insurance of property and persons or other financial organization, an agricultural or other cooperative, a self-managed special-interest community, an agency or organization of a sociopolitical community, a sociopolitical organization, any other public

organization, any other self-managed organization or community, or civic association must by 20 March 1981 furnish every worker employed in it data on a census form concerning the title or corporate name, address and registration number of the organization of associated labor or other organization or community and of the constituent unit in which he works and activities under which the organization or community is classified and the same data on a civic association, as well as the following data from labor records--data on schooling, occupation and level of specialized education of personnel.

Article 9

Persons designated as censustakers, instructors, supervisors or assigned to perform other tasks and jobs related to the census must participate as such in the census.

Article 10

The persons referred to in Article 9 of this law are required to keep as an official secret all data gathered from individuals pertaining to their person, family and property.

Article 11

The census shall be organized and conducted by the federal organization competent for statistical affairs, federal administrative agencies and federal organizations designated by this law, and by the competent agencies in the republics and the competent agencies in the autonomous provinces.

Article 12

The federal organization competent for statistical affairs, in collaboration with the competent agencies for statistical affairs of the republics and the competent agencies for statistical affairs of the autonomous provinces: shall work out the methodology of the census with uniform definitions of units and features and uniform classifications and content of processing and publication tables of interest to the entire country; shall work out the methodology and conduct statistical checking of the quality of the data gathered in the census; shall set forth uniform criteria for detection and automatic correction of errors in the census material; shall coordinate work to develop the logical checking program; shall coordinate work to develop tables for the uniform program of interest to the entire country.

The federal organization competent for statistical affairs shall provide the census material for the census of citizens of the Socialist Federal Republic of Yugoslavia abroad and for the census of persons doing military service, shall work out the tables of the census results for the entire territory of the Socialist Federal Republic of Yugoslavia and shall publish

the results of the census under the uniform program, along with data of interest to the entire country.

Article 13

The federal administrative agency competent for national defense affairs shall organize and conduct the census of persons doing military service and of persons who are in military facilities at the time of the census.

Article 14

The federal administrative agency competent for foreign affairs shall organize and conduct the census of citizens of the Socialist Federal Republic of Yugoslavia working in the following: diplomatic and consular missions of the Socialist Federal Republic of Yugoslavia abroad; in wholly or partially Yugoslav-owned enterprises abroad; in wholly or partially Yugoslav-owned banks or financial organizations abroad; in wholly or partially Yugoslav-owned insurance or reinsurance organizations abroad; in permanent business units and temporary business units abroad; in joint economic representative offices abroad; in the United Nations and its organizations, as well as the census of citizens involved on the basis of international technical and other cooperation and members of households residing abroad with such persons.

Article 15

The federal organization competent for statistical affairs, the federal administrative agency competent for foreign affairs, the federal administrative agency competent for affairs of labor, health and social welfare and the federal organization competent for employment security affairs, in collaboration with the competent agencies in the republics and the competent agencies in the autonomous provinces, shall organize and conduct the census of citizens of the Socialist Federal Republic of Yugoslavia working abroad for foreign employers or self-employed and members of households residing with them.

Article 16

The official who heads the federal organization competent for statistical affairs shall prescribe the contents of the necessary forms and shall furnish specialized and methodological instructions for the organization and conduct of the census.

The official who heads the federal organization competent for statistical affairs is required to obtain the following opinions before issuing the instructions referred to in Paragraph 1 of this article:

1) the opinion of the federal secretary for national defense--with respect to the census of military personnel and civilian employees of the Yugoslav People's Army and of persons doing military service,

2) the opinion of the official heading the federal administrative agency competent for foreign affairs--with respect to the census of the individuals referred to in Article 14 of this law,

3) the opinion of the official heading the federal administrative agency competent for foreign affairs, the opinion of the official heading the federal administrative agency competent for affairs of labor, health and social welfare and the opinion of the official who heads the federal organization competent for employment security affairs--with respect to the census of persons referred to in Article 15 of this law.

Article 17

The federal organization competent for statistical affairs shall publish the following:

1) the first results of the census for the Socialist Federal Republic of Yugoslavia, the republics, the autonomous provinces and the opstinas--within 30 days from the date when the taking of the census is completed;

2) the results of the census of interest to the entire country--according to the program adopted for processing the data from 1 December 1981 to 30 June 1983.

Article 18

The federal organization competent for statistical affairs shall submit reports to the Assembly of the Socialist Federal Republic of Yugoslavia on fulfillment of the Program of Tasks and Functions of Federal Agencies and Organizations in the 1981 Population, Household and Housing Census and on expenditure of funds to finance that program--by the end of the month of March of each year for the past year, and by the end of March 1984 it shall submit the final account of the funds spent.

Article 19

A basic or other organization of associated labor, association or community of organizations of associated labor, contract organization of associated labor, bank, community for insurance of property and persons or other financial organization, agricultural or other cooperative, self-managed special-interest community or other self-managed organization or community or civic association shall be fined no less than 5,000 and no more than 50,000 dinars for a misdemeanor if by 20 March 1981 it does not furnish every worker employed in it on the census form data on the name or corporate name, address, registration number of the organization of associated labor or other organization or community, as well as of the constituent unit in which they work and the activities in which it is classified or the activities of the civic association, and from labor records--data on schooling, occupation and the level of specialized training of personnel (Article 8).

The person responsible shall also be fined no less than 1,000 and no more than 5,000 dinars (Article 8) for a misdemeanor for the action referred to in Paragraph 1 of this article.

Article 20

The person responsible in the agency or organization of the sociopolitical community, in the sociopolitical organization or in the public organization which by 20 March 1981 does not furnish on the census form to every worker employed in it data on the name, address and registration number of the agency or organization in which he works and the activities in which it is classified, and from labor records--data on schooling, occupation and level of specialized education of personnel (Article 8)--shall also be fined no less than 1,000 and no more than 10,000 dinars for a misdemeanor.

Article 21

An individual as referred to in Article 9 of this law who in taking the census influences a citizen to declare against his will his nationality, ethnic minority or ethnic group shall be punished by a fine of 5,000 dinars or a prison sentence not to exceed 60 days (Article 9 in conjunction with Article 6, Paragraph 3).

Article 22

An individual as referred to in Article 9 of this law shall be fined no less than 500 and no more than 5,000 dinars for a misdemeanor if without good cause he refuses to participate in performing the tasks and functions referred to in that article.

Article 23

An individual included in the census who refuses to give data to a person as referred to in Article 9 of this law which are required by the census or who gives inaccurate data or prevents the verification of the data given (Articles 3, 4 and 5) shall be fined no less than 500 and no more than 5,000 dinars for a misdemeanor.

Article 24

This law shall take effect on the eighth day after publication in SLUZBENI LIST SFRJ.

FEDERAL CHAMBER ISSUES CONCLUSIONS ON DELEGATE SYSTEM

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 41, 25 Jul 80 pp 1333-1335

[Conclusions issued by the Federal Chamber in Belgrade on 17 July 1980 and signed by Federal Chamber President Stana Tomasevic-Arnesen]

[Text] On the basis of Article 136 of the Operating Procedure of the SFRY Assembly and Article 219 of the Operating Procedure of the Federal Chamber of the SFRY Assembly, the Federal Chamber of the SFRY Assembly, in a session on 17 July 1980, upon examination of the material entitled "Certain Issues in Achieving the Delegate Assembly System and Tasks of Assemblies" and the material entitled "Certain Experiences in the Work of the Federal Chamber of the SFRY Assembly on the Delegate Basis," issued the following

Conclusions

1. In the functioning of the assemblies of sociopolitical communities on the delegate basis so far worthwhile experience has been gained that constitutes a significant basis for further construction and improvement of the delegate assembly system and for more effective performance of the role of various social entities in that system.

The delegate assembly system is being confirmed more and more as a significant factor toward strengthening the self-management position of the workers and of their basic organizations and communities, for expression and self-management reconciliation of their interests and needs and for their ever broader inclusion in the process of policy formulation and decisionmaking in assemblies of sociopolitical communities.

However, experience so far also indicates a number of difficulties and problems in achieving the delegate assembly system. After all, the effective functioning of that system is most firmly related to development of self-management socioeconomic relations in organizations of associated labor and in society at large, to the material base of associated labor, to achievement of the constitutional status of the working class and of all working people in the management of income and the governance of society as a whole, to the effectiveness of the institutions of the political system

and to broader practice of conclusion of social compacts and self-management accords to resolve social issues, and also to strengthening social oversight in the conduct of the established policy. However, the functioning and further development of the delegate assembly system should also be examined in the context of socioeconomic relations as a whole, and specifically in their most direct relation to achievement of the policy of economic stabilization.

2. In connection with the functioning and achievement of the delegate assembly system as a whole there is a need for all working people and citizens in self-managed organizations and communities and in sociopolitical organizations, and also their delegations and delegates, as well as the assemblies of sociopolitical communities--to critically examine experience gained so far in the exercise of their rights and discharge of their obligations and responsibilities and to set forth specific programs of measures and activities to overcome more rapidly the definite dilemmas, shortcomings and difficulties that exist in achievement of that system.

There is accordingly a need for the following:

a) through appropriate measures and activities within organizations of associated labor and other self-managed organizations and communities to create and guarantee conditions for exercise of the rights and discharge of the duties and responsibilities of delegations, for adoption of basic views on the basis of the interests of the working people and citizens expressed through self-management, for linkage of delegations and for adoption of joint positions governing the work of delegates, as well as for these activities to be stimulated through the measures and activities of assemblies of sociopolitical communities;

b) in assemblies of sociopolitical communities for more complete regulation of the basic issues important to the functioning of assemblies on the delegate basis (method of informing and involving delegations in the proceedings and decisionmaking of assemblies, programming the work of assemblies, the rights of delegations in so-called legislative initiative, the role of delegations and delegates in the procedure of adopting legislation, the obligations and tasks of executive and administrative organs related to the functioning of delegations and assemblies on the delegate basis, etc.);

c) for further improvement of cooperation of assemblies of sociopolitical communities in connection with coordinating and synchronizing their work programs, coordinating basic solutions in the procedure of adoption of legislation and other matters important to the coordinated operation of the assembly system and performance of their functions in the procedure for statement of policy and adoption of legislation, in overseeing enforcement of the stated policy and legislation, in the exercise of policy control over the work of executive and administrative organs and in other matters of common interest.

3. With respect to the functioning of the Federal Chamber of the SFRY Assembly on the delegate basis, the chamber, its working bodies and delegates shall strive to carry out the following program of measures and activities:

First--if the delegates in the Federal Chamber and thereby the chamber itself are to have the most direct and firmest ties with their delegate base in self-management, the following are particularly necessary:

i. the fullest possible linkage of delegations of self-managed organizations and communities and sociopolitical organizations in the republic or autonomous province in order to formulate positions governing the work of delegates in the Federal Chamber, this to be done through conferences of delegations and delegates in the chambers of assemblies of opstinas and assemblies of republics and autonomous provinces and other forms of relation of delegations and delegates, with the vigorous participation of sociopolitical organizations;

ii. encouragement of delegations and their self-managed organizations and communities to take the initiative and submit proposals in the procedure for preparation of the work programs and plans of the Federal Chamber and to ensure their vigorous participation in examination of those programs and plans, whereupon, after their adoption, the delegations would bring their own work plans into conformity with the topics and dates in the work program of the Federal Chamber in which they have an interest;

iii. in the procedure for reexamination and amendment of the provisions of the Operating Procedure of the Federal Chamber particular attention should be paid in the current proceedings of the chamber to the questions of procedure for preparation and adoption of legislation, in which more appropriate participation and role should be furnished to delegations and to the forms of their relation to delegates (beginning with initiatives and proposals for adoption all the way to adoption of legislation, ensuring a more vigorous role of the chamber and its working bodies in examination and monitoring of the conduct of policy and enforcement of legislation and establishment of the obligations of the Federal Executive Council and federal administrative agencies), as well as to matters important to synchronizing the work and to cooperation of the Federal Chamber with assemblies of sociopolitical communities, with sociopolitical organizations and with other social entities;

iv. self-managed organizations and communities and sociopolitical organizations in the republic or autonomous province should regularly monitor the work of their delegates in the Federal Chamber, and it is the duty of the delegates to completely and regularly inform them about their individual and joint work in the Federal Chamber and its working bodies;

v. along with work on amendments of the SFRY Constitution, work should also be undertaken on those amendments and supplements to the Operating Procedure of the SFRY Assembly and the Operating Procedure of the Federal

Chamber, which, implementing the initiative toward further improvement of collective work, decisionmaking and responsibility, would ensure consistent implementation of those principles and arrangements in the organization and proceedings of the Federal Chamber and its working bodies.

Second--that forms of cooperation of the Federal Chamber and its working bodies with the assemblies of the republics and autonomous provinces and their working bodies be further developed and improved, and specifically the following:

i. particular topics and tasks in the work programs and plans of the Federal Chamber would be coordinated from the standpoint of time and manner of their realization with the same or similar topics contained in the work programs of republic and provincial assemblies, especially when the latter assemblies have an interest in simultaneous legislative or other activity in the particular area;

ii. that their collaboration be manifested still more in monitoring the conduct of policy and in setting forth policy governing enforcement of laws and other general enactments, again a matter in which they have their common interests;

iii. that the Federal Chamber and its working bodies encourage and take under consideration initiatives, opinions and proposals on matters submitted by various republic and provincial assemblies and their working bodies.

Third--that tasks and obligations and also operating procedures of the Federal Chamber and federal administrative agencies be brought into conformity with the needs of the operation of the Federal Chamber on the delegate basis. The following are necessary in this regard:

i. insistence that the Federal Executive Council and federal administrative agencies, when they are preparing and presenting materials for the needs of the Federal Chamber (summaries, clearer supporting arguments, alternative proposals, indication of the social and material consequences of the solutions proposed, and so on) make it possible for delegations and delegates to enter more easily into the essence of the issues and problems raised in the proposed legislation and material, thereby making it easier for them to take a position on them. Accordingly, material which has not been prepared in conformity with the provisions of the Operating Procedure of the SFRY Assembly and Operating Procedure of the Federal Chamber shall be rejected for consideration more consistently than in the past;

ii. without detracting from the role of proposals and initiatives coming from the Federal Executive Council and federal administrative agencies, legislative and other initiatives and proposals of delegations and delegates and of self-managed organizations and communities shall be manifested to a greater extent in the work of the Federal Chamber and its working bodies, and the working bodies of the chamber shall on the particular topics

in the work program take over certain tasks and thereby the role of proponents of individual laws and other general legislation. In so doing they are to have the full professional and other assistance of federal administrative agencies and the Federal Executive Council;

iii. the Federal Executive Council shall ensure organized and timely discharge of the obligations which it and federal administrative agencies have assumed in carrying out the work program of the Federal Chamber and shall regularly inform the Federal Chamber concerning cases of and reasons for justified postponement and overrunning of the deadlines which have been fixed, which must more and more be exceptions in future work.

Fourth--the Federal Chamber and its working bodies should collaborate on an ongoing basis with sociopolitical organizations and their organs and forms of activity both in the procedure of preparing and adopting the work program and also on matters of common interest as set forth in work programs. Accordingly, the Federal Chamber and its working bodies shall devote full attention to initiatives, proposals and opinions of sociopolitical organizations at the federal level.

4. These conclusions shall be published in SLUZBENI LIST SFRJ.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ORDER REGULATES NAVIGATION IN TERRITORIAL, INNER WATERS

Tirana GAZETA ZYRTARE in Albanian No 3, Jun 80 pp 47-54

[Council of Ministers Order No 2 of 2 May 1980 "On the Regulations on Navigation in the Territorial Waters and the Inner Waters of the People's Socialist Republic of Albania"]

[Text] The Council of Ministers, on the basis of Article 6 of Decree No 4650 of the Presidium of the People's Assembly of 9 March 1970 "On the Border of the People's Republic of Albania," amended by Decree No 6181 of 26 April 1980, issues this order:

I. General Provisions

Article 1

The passage of foreign non-military vessels into the territorial waters of the People's Socialist Republic of Albania is peaceful when it does not damage the social system and security of the People's Socialist Republic of Albania and its economic interests.

Article 2

Foreign non-military vessels which have the right of peaceful transit are allowed to pass through the territorial waters of the People's Socialist Republic of Albania on their way to other countries, traveling parallel with the base line of the inner waters no closer than 3 miles to this line, with the exception of the Strait of Corfu, where passage is in the middle of the canal.

Foreign non-military vessels which are headed for the open ports of the People's Socialist Republic of Albania sail along routes established by the harbor offices.

Article 3

The open ports of the People's Socialist Republic of Albania in which the entry and docking of foreign non-military vessels are permitted are: Durres, Vlore and Sarande and their bays.

The following sea and land regions are forbidden areas: Bishti i Palles, Dukati Bay, Palermo, Sazan Island, Limjoni and Shengjini. The regulations for entry, travel and docking in prohibited zones for ships of the merchant fleet and the fishing fleet of the People's Socialist Republic of Albania, for the means of communication and for Albanian citizens are determined by the Ministry of People's Defense.

Article 4

The Ministry of People's Defense, for training purposes, stipulates that some sea regions be closed temporarily to navigation and game fishing, notifying the office of the captain of the ports 10 days in advance so that the appropriate announcements can be made.

Article 5

Foreign non-military vessels which sail in the territorial waters of the People's Socialist Republic of Albania must keep their state flag raised and when they sail in the inner waters and are headed for open ports they must also fly the state flag of the People's Socialist Republic of Albania. At night they must keep their navigation lights lit in accordance with international regulations.

Article 6

Foreign non-military vessels cannot engage in hydrological and hydrographic studies, in photographing, filming, game fishing and other operations of any type in the territorial waters or the inner waters of the People's Socialist Republic of Albania without the permission of Albanian state organs.

Article 7

Foreign non-military vessels, which enter into the territorial waters and the inner waters without the permission of the Council of Ministers of the People Socialist Republic of Albania, are dealt with in accordance with the orders of the Ministry of People's Defense.

Article 8

Merchant ships, fishing vessels and those belonging to other Albanian organizations, during their movement from a port or from one place on the Albanian coast to another, are obliged to sail along coastal routes established by the harbor offices. Fishing vessels are not allowed to fish in prohibited regions.

Article 9

Regulations on the navigation and entry and exit of vessels of the Navy of the People's Socialist Republic of Albania in the ports and the coastal bays are established by the Ministry of People's Defense.

Article 10

The marine hydrographic service places and maintains the coastal lights and other signals needed for navigation in the coastal areas, in the territorial waters and in the inner waters. The harbor offices, the state organs and enterprises in the coastal area are obliged to help to repair, place and service the lights and other signals in the water and on the coast and to extinguish any other lights similar to these signals and to stop the setting up of objects which obstruct the view.

Military units which have lighthouses in their areas are obliged to put the lights on and extinguish them at the proper time.

II. Regulations on the Permitting of the Navigation and Docking of Foreign Ships and Albanian Ships

Article 11

The crossing of the border of the People's Socialist Republic of Albania to the seaports, through the border crossing control points, takes place in accordance with the instructions of the Ministry of Internal Affairs.

Article 12

The harbor offices of the open ports must give notification in writing to the command of the unit responsible for the protection of the sea border and to the port authority 24 hours before the arrival or departure of foreign ships and Albanian ships engaged in foreign navigation and immediately after their actual arrival and departure. This notification must contain: "the name of the ship, the time of arrival, the state flag, the type and tonnage of the ship and the number of crew members and passengers.

Article 13

The harbor offices, in the case of movement within the territorial waters and the inner waters of merchant and tourist and tourist ships and vessels belonging to other Albanian organizations and the managements of fishing enterprises, in the case of fishing ships, will submit, on a daily basis, to the command of the appropriate sea border protection unit and the port authority, a schedule for the ships' movements for the next day, indicating: the name of the ship and its captain, the time of departure, the destination, the estimated time of arrival and the estimated time that the fishing vessels will remain in the fishing grounds.

For urgent economic reasons and in unforeseen circumstances, the reporting of the above information takes place immediately and the departure of the vessel is not delayed.

The harbor offices and the managements of the fishing enterprises, with the arrival of a vessel in dry dock, will immediately notify the appropriate sea border protection command and the port authority.

Article 14

When fishing vessels must leave the restricted fishing area in order to follow the fish, they must immediately notify, by radio or other means of communication, their enterprises, which must then notify the appropriate border guard command and port authority of their delay in returning to the fishing zone.

Article 15

The Ministry of Communications and the Ministry of Light Industry and the Food Industry provide radio stations for all vessels of the merchant fleet and fishing fleet, with the exception of motor boats.

The General Directorate of Posts and Telecommunications will organize and ensure uninterrupted radio communications at the frequencies stipulated in the nomenclature of the coastal stations, so that foreign ships and vessels of the merchant fleet and the fishing fleet can establish communication whenever they enter for work. Foreign ships and vessels of the merchant and fishing fleet give immediate notification of their exact location, while the coastal radio station notifies the harbor offices where the station is operating, in the case of foreign ships, and notifies the appropriate enterprises, in the case of vessels of the merchant fleet and fishing ships of the People's Socialist Republic of Albania.

The ships are obliged to carry out the requirements of the coastal station. The harbor offices, the fishing enterprises and the Directorate of the Merchant Fleeet organize 24-hour service. They report to the unit responsible for the protection of the sea border and to the port authority organ the information which they receive from the radio stations in regard to the movement of ships of the People's Socialist Republic of Albania.

Until the fishing vessels are supplied with radio stations, the fishing activity is organized on the basis of groups of ships, thus assuring continuing communication with the radio stations of the coastal communications system.

Article 16

The Ministry of People's Defense, in order to assure the recognition of the vessels belonging to Albanian enterprises and organizations and help them in case of need, will establish signals for conversations between Albanian vessels and coastal observation posts.

Article 17

If merchant ships and fishing vessels belonging to Albanian enterprises and organizations notice in the territorial and inner waters mines or other dangerous exploding objects, they must immediately inform the

management of their enterprise, while keeping the object under constant observation until the arrival of the specialists or ships designed for this purpose. The enterprise management must immediately notify the military command charged with guarding the coast and the organ of the port authority so that appropriate measures can be taken.

Article 18

Ships and other sailing means of the People's Socialist Republic of Albania have the right to dock in the [as printed] as well as in other coastal areas established by the Ministry of People's Defense. The docking of ships and sailing means at other areas of the coast, with the exception of prohibited zones, is permitted after the notification of the border unit commands.

Article 19

Small boats belonging to enterprises, agricultural cooperatives, and social organizations must remain docked and guarded during the entire period they are not in use. During the period they are being used they will remain anchored at sea and supervised by those who operate them.

Small boats that are not administered by fishing enterprises can be used only in restricted coastal areas and only by authorized persons. The area and the period of navigation will be established by the local government organs in cooperation with the coastal commands. Small boats administered by fishing enterprises can be used by persons authorized by the directorates of the enterprises.

III. Regulations on the Examination of Albanian and Foreign Ships

Article 20

At the time of the arrival in dry dock and the departure from the port of foreign ships and Albanian vessels engaged in foreign navigation, the harbor offices, the border organs of the port, the health, customs and sea agency organs must carry out an examination of the credentials of the crew, the passengers, the cargo, the documents and of the health situation.

After the examination is completed, action is taken in accordance with provisions in force.

Article 21

The sea border service of the navy will exercise control over the implementation of the provisions regarding the navigation of foreign and Albanian non-military ships sailing in inner and territorial waters. In open ports and their bays the control will be made by the harbor offices and the border port authorities.

Article 22

The sea border service of the navy has the right to investigate the peaceful nature of the navigation of foreign ships and the observance of navigation regulations by them in the territorial and inner waters of the People's Republic of Albania. If the intentions of foreign ships are not peaceful or if they violate navigation regulations, they must be stopped, directed outside the territorial waters, or brought into the nearest open port, where they will be turned over to the harbor offices or investigating authorities.

Article 23

Albanian ships, when applying navigation regulations in inner and territorial waters, have the duty when they see any foreign or Albanian ship violate these rules to immediately inform the management of their enterprise which will inform the appropriate sea border protection command unit.

Article 24

Non-military foreign vessels which violate the navigation regulations are taken by the border protection vessels of the navy, escorted to the nearest open port and handed over to the organs of the harbor offices and the port authority organ. A procesverbal will be drawn up for the illegal activities; it will be read and signed by the representative of the border protection ship and by the captain of the non-military foreign ship and an interpreter will be provided if necessary. One copy of the procesverbal, if requested, will be given to the captain of the foreign ship and a copy will be given to the harbor office and the organ of the port authority.

Article 25

Albanian ships violating navigation regulations will receive a warning. If the violations are serious and repeated, they will be escorted to the nearest port where they will be investigated by the respective authority.

Article 26

When a foreign non-military ship or an Albanian ship, during navigation in territorial or inner waters suffers an accident or is sinking, it will be allowed to dock at the nearest port or other areas on the Albanian coast stipulated for such a purpose.

The places where ships, foreign or domestic, can be docked in the above situation are:

a) The open ports and their bays (by the Ministry of Communication);

b) Other coastal points (by the Ministry of People's Defense).

IV. Final Provisions

Article 27

The violation of this ordinance, if it does not constitute a penal act will be subject to a fine according to the provisions of the Decree on Harbor Offices.

Article 28

Council of Ministers Order No 1 of 26 January 1962, "On the Regulation of Navigation in the Territorial and Inner Waters of the People's Republic of Albania," is abrogated.

Article 29

This ordinance becomes effective 15 days after its publication in GAZETA ZYRTARE.

Chairman of the Council of Ministers
Mehmet Shehu

DEFINITION OF ELEMENTS CONSIDERED AS STATE SECRET

Sofia DURZHAVEN VESTNIK in Bulgarian 19 Aug 80 pp 765-767

[List of Facts, Information, and Objects Considered as State Secret of the Bulgarian People's Republic (approved by Decree No 30 of the Council of Ministers dated 4 June 1980)]

[Text] Information Related to the Defense of the Country

1. Information on the location, movements, names, numbers, organization, and table of organization and listed strength of the personnel, systems for the management and material and financial support of the armed forces of the republic, entirely as well as for the individual arms and branches of troops, formations, large units, units, subunits, ships, offices, establishments, and military sites.

2. Information on the condition, dimensions, capacity, number and location of naval bases, base and control centers, coastal defense, the lighthouse and hydrographic service, military airports and landing sites, navy ships, protection of state borders, antiaircraft defense, and other military sites, institutions, and establishments.

Information on the total handling capacity of sea and river ports, the condition of the ships of individual shipping administrations and the country at large, and the capacity of shipbuilding, ship repair, and aircraft repair enterprises.

3. Information on the battle and mobilization readiness, combat training, moral-political condition and combat capability, combat support, armaments, communications facilities, military transportation and availability of fuels and lubricants by the armed forces of the republic at large and for the individual branches and arms of troops, formations, large units, units, subunits, ships, and military sites, and data on the tactical-technical possibilities and combat utilization of armaments and other combat and support equipment.

4. Information on operative-tactical and tactical-technical assignments and requests for new experimental prototypes of armaments and other combat

and auxiliary equipment, and information on the adoption of such prototypes as armaments.

Information on strategic, operative, and tactical concepts of warfare and combat activities and documents (regulations, instructions, reports, etc.) presenting such concepts. Information on exercises conducted.

5. Information on materials used by the Ministry of National Defense and Ministry of Internal Affairs, on increase or decrease of their stocks, on warehouses for armaments and ammunition, and on financial allocations.

Summarized information on quantities of liquid fuels and lubricants allocated and delivered to meet the requirements of the Ministry of National Defense and Ministry of Internal Affairs, and the other forces.

6. Information on exceptional incidents, accidents, and breakdowns involving armed forces personnel and combat equipment of the armed forces of the republic and the individual branches and arms of forces, units, and military sites.

7. Information or documents on talks, treaties, or agreements with Warsaw Pact members or with other countries, related to the country's defense.

8. Information on the number of young people subject to and fit for military service in the armed forces and the construction and other forces, for the country at large or by military district.

Information on reserve personnel subject to military training and on already trained personnel.

9. Information on the mobilization or operative plans of the armed forces of the country at large and by individual arm and branch of forces, units, and military sites and information, long-term plans, directives, reports, legal documents, and accountability information on their operative, combat, and mobilization readiness.

10. Information on mobilization and operative plans, estimates, projects, and measures related to insuring the defense capability of the country along the lines of state administration, industry, transportation, communications, and other national economic sectors.

Information, plans, and documents on the organization, management, condition of training and combat readiness, evacuation and dispersal, defense equipment and other measures related to insuring the country's civil defense.

11. Information on the amounts, composition, condition, location, and purpose of mobilization reserves of all types (manpower reserves, animals, materials, transport facilities, and others) for the armed forces of the country at large and for the individual arms and branches of the forces, formations, large units, units, subunits, and military sites and data on the evacuation of economic organizations, branches, offices, and others.

12. Topographic maps and charts whatever their scale, their copies, catalogues, lists, and other documents with coordinates of points of the astronomical, triangulation, gravimetric and magnetic grid of the country, values of the force of gravity and its anomalies, vertical level deviations, height of the quasigeoid, and material and data making it possible to draft such charts and maps or compute such coordinates.

All types of special charts and maps and their prints and copies based on topographic charts of all scales.

Aerial films and photographs, their copies, and ground panoramic or perspective photographs of military sites, the sea coastal strip, industrial areas, industrial sites, and other sites of national importance and photographs which could be used for topographic purposes.

Information on data provided by earth satellites from stations related to state systems of coordinates and summarized information on the depth, topography, and nature of sea and river bottoms and elements determining the hydrological system of coastal waters (with the exception of fairways used in international navigation).

13. Information on the precise location of electric power plants, dams, water sources, hydroengineering installations, treatment stations, tracks of principal water mains supplying or planned for the supply of water to big cities, railroad junctions, and major industrial centers.

Data on installations along rivers and convenient areas for river fording by troops.

14. Information on discoveries, inventions, rationalization suggestions, and research and experimental work in science and technology of importance to the country's defense.

Information Related to the Country's Internal Security and Foreign Policy

15. Information on duly classified foreign and domestic policy based on the fact that knowledge of such information by someone else could harm the interests of the country.

Information on the political-economic and military condition of foreign countries, based on unpublished data, and whose dissemination could result in diplomatic complications.

16. Information on the composition, combat readiness, combat training, moral-political condition, combat capability, strength, and deployment of cadres, and on the organization and nature of the tasks, and ways and means of the operative work of the Ministry of Internal Affairs and its units, as well as information on their armaments.

17. State codes, aids, installations, means of operation, and coded data.

Economic Information

18. Information or documents which, by decision of CEMA and other intergovernmental organs have been proclaimed confidential, as well as information and documents on bilateral or multilateral intergovernmental agreements.

19. Location of defense industry enterprises, general plans and technical specifications of enterprises producing military goods; size of their personnel and amount of their wage fund, as well as information on military output and related production capacities; draft plans and plans for the production and delivery of equipment and materials.

20. Summarized information on production capacities, plans, and reports on their implementation in physical terms related to the production of special items by industrial sector.

21. Information on the organizational-technical and programmed defense of control and information systems of departments and higher maangement organs.

22. Information on mastering the production of military items and the development of mobilization capacities for the production of military equipment and ammunition by economic organizations and their branches.

23. Information on construction projects directly related to the defense of the country and the military industry.

24. Information on the availability, stockpiling, and location of stored state material reserves.

25. Information on stockpiles, production capacities, production of rare, radioactive, dispersed, and superpure metals, their export and import in physical and cash terms, and the location of deposits of radioactive and rare earth elements.

26. Information on proven nonferrous and precious metal deposits and on the growth of proven large individual deposits.

Information on production capacities, plans for the production of nonferrous and precious metals, concentrations and products containing such

metals, and reports on the implementation of such plans in physical terms for the country at large and the individual economic organizations and their branches.

27. Information on available and necessary liquid fuels and lubricants for the country at large and summarized information on the locations and capacity of basic facilities for their storage.

Information on production capacities and annual and long-term plans and reports on petroleum refining and production of petroleum products for the country at large.

Summarized information, plans, and charts on the precise location of the tracks and principal installations among main pipelines for the transportation of gas and petroleum products.

Summarized information on equipment insuring control of the country's energy system.

28. Discoveries, inventions, and research and experimental work in the fields of science and technology of major scientific and national economic significance before a permit for their publication has been issued.

Transportation and Communications

29. Information on the handling and hauling capacity of railroad tracks and individual railroad sections, and on the processing capacity of marshalling and section railroad stations and peak train traffic schedules.

Summarized information on automation and telemechanic installations within the transport control system.

30. Information on the quantity, type, capacity, and technical condition of the transportation rolling stock--locomotive engines, railroad cars and trucks, on the Ministry of Transport, the special departments, and the country at large.

Overall situation plans and charts of railroad tracks, railroad junctions, marshalling yards and section railroad stations, airfields, maritime and riverine ports, railroad bridges with spans exceeding 20 meters and bridges over 50 meters long along the highways, and data on their special equipment.

31. Summarized information on the numerical strength and condition of flying and technical facilities, number of all types of airplanes and helicopters, information on the airport network, the quality, type of equipment, and handling capacity of individual airfields and airfields in general, and on the country's civilian air fleet.

32. Information on the capacity, type and number of telegraph-telephone and radio relay lines, television, radio communications and radiobroadcasting stations and other facilities related to the country's defense preparations in terms of communications.

33. Summarized information on mobile and fixed telegraph and telephone equipment and television, radio and radio relay stations of individual okrugs, main lines, directions, and the country at large.

Information on the internal breakdown of radio communications frequencies.

Finances and Trade

34. Information on the gold and foreign exchange stock, the monetary circulation in the country, and the means for protecting the currency from forgeries.

35. Information on the cash and foreign currency plan and the payment and accounts balance of the republic in absolute figures.

Information on the annual and quarterly foreign exchange plans of ministries and departments.

Information on granting foreign exchange loans for imports, including contracts for such loans prior to the conclusion of the deal.

Summarized information on foreign loans used or granted by the country.

Summarized information on losses from economic activities on a national scale and analyses of losses.

36. Information on state budget outlays for planned losses and expenditures directly related to the country's defense.

37. Consolidated balances of financial results from the foreign trade activities of the Ministry of Foreign Trade and their form documents.

38. Information on deadlines for deliveries, approved on the basis of a plan or document of the Council of Ministers for equipment and materials in short supply and licenses to be imported from foreign countries, as well as directives and opinions on conditions for the conclusion of foreign trade deals.

39. The annual and quarterly import and export plans for the country at large and for ministries, other departments and foreign trade organizations for the following indicators: type, on a national scale, foreign exchange value, planned prices and export returns, and accountability data revealing the content of such plan indicators.

Summarized information and studies regarding the condition, long-term plans and forecasts of the development of foreign trade as well as other summarized data on imports and exports, knowledge of which would harm or could harm the country's interests.

RELATIONS BETWEEN BULGARIA, IRAQ IMPROVING

Sofia BULGARIA TODAY in English No 9, 1980 p 9

[Article by Petko Loukanov: "Mutual Interest, Good Possibilities"]

[Text]

The Republic of Iraq is one of the Middle East countries with which the People's Republic of Bulgaria is continually expanding her political, economic and cultural relations, ones based on equality, mutual respect and benefit. Traditional friendly relations between the two peoples have been expanding with every passing year, covering ever new spheres of cooperation.

Bulgarian-Iraqi relations received a powerful impetus in their fruitful development after Comrade Todor Zhivkov's visit to Iraq in 1974 and again in May 1980 and his meetings with the Iraqi leaders. Along the same line the visit paid to Bulgaria in 1975 by Saddam Hussein, Deputy General Secretary of the Regional Leadership of the Arab Socialist BAATH Party and President of the Iraqi Republic, was an important contribution to the expansion of friendly cooperation.

The following documents were signed during Comrade Todor Zhivkov's visit to Iraq last spring:

– A plan for cooperation between the Bulgarian Communist Party and the Arab Socialist BAATH Party for the period 1980-1981.
– An economic and techno-scientific cooperation agreement.
– A long-term programme for the development of trade, industrial, and techno-scientific cooperation.
– The protocol of the Mixed Bulgarian-Iraqi Committee of Economic and Techno-Scientific Cooperation.

Cooperation between the two countries is regulated by a number of intergovernmental agreements, the main features of which are trade, the supply of complete projects, designing, construction, land improvement schemes and geological surveys.

Trade plays the principal part in Bulgarian-Iraqi economic and commercial relations. Trade in 1979 was double what it was in 1978. Thus the Iraqi Republic is in the top three countries of the 75 developing countries which are among Bulgaria's trade partners. There are conditions for a still greater expansion of trade and for diversifying the export lists. Machines and equipment for industrial purposes predominate in Bulgaria's exports to Iraq (about 50 per cent) followed by foodstuffs, products of the light industry and other goods.

Bulgaria was one of the first countries in the world to purchase oil from Iraq after the nationalisation of the Iraqi Petroleum Company in June 1972. We also import sulphur,

dates, sheep skins and other products.

Long-term contracts have now come to the fore in the economic relations between the two countries. The agreements signed on the development of economic, techno-scientific and cultural cooperation give wide scope for cooperation and specialization in industry, for the training of specialists and for the exchange of experience in various spheres of the national economy.

Bulgarian civil engineers and building workers are well known in Iraq. Through the Technoexportstroi Co. a number of projects have been built and brought on stream there. Nearly 30 bridges, the international airport of Baghdad, highways, the sewerage system of Baghdad, 180 km long, and the Dialla irrigation system are real symbols of Bulgarian-Iraqi friendship. New monuments in ancient Mesopotamia are the bridges spanning the Rivers Tigris and Euphrates.

There are big possibilities in agriculture and land improvement. Bulgaria's extensive experience in building up industrialized agriculture can be of use to the developing countries.

The Agrocomplekt State Firm is fulfilling contracts to build the irrigation-drainage fields of Shahemia and Suwera. The Bulgargeomin State Economic Corporation is making seismic and drilling surveys, prospecting for oil and gas. This organization, in cooperation with Technoimport is building the oil pipeline and oil products depots in Russafa al-Jadida. These two projects are the first attempt of several countries of the Council for Mutual Economic Assistance to undertake joint construction work in Iraq. The Soviet Tsvetometpromexport organisation is supplying most of the material necessary for the construction. Without doubt the cooperation between the two countries will continue to expand at accelerated rates in the future. For, as Todor Zhivkov, First Secretary of the CC of the BCP and President of the State Council of the People's Republic of Bulgaria said, Bulgarian-Iraqi friendship 'has sound roots, because it is based not only on mutually beneficial bilateral cooperation, but also on our common struggle against imperialism, colonialism and reaction, for peace, security and understanding in the world.'

PETKO LOUKANOV

Saddam Hussein, Secretary of the Regional Leadership of the Arab Socialist BAATH Party and President of the Iraqi Republic, welcoming Todor Zhivkov, First Secretary of the CC of the BCP and President of the State Council of the People's Republic of Bulgaria, at Baghdad Airport, May 1980

DECREE ALLOWS PRACTICE OF SMALL BUSINESSES, TRADE

Sofia DURZHAVEN VESTNIK in Bulgarian 22 Jul 80 pp 633-635

[Council of Ministers Decree No 37 of 3 July 1980 for Exercising of Artisan and Trade Activity by Citizens]

[Text] The Council of Ministers decreed:

Single Article. (1) Approves an ordinance allowing small trade and artisan businesses by citizens.

(2) The minister of finance:

1. Specifies jointly with the minister of internal trade and services the mandatory documents necessary for the persons in business falling under this ordinance;

2. Specifies the order and manner of imposing taxes and fees on the persons involved according to the preceding item.

Chairman of the Council of Ministers St. Todorov

Chief Secretary of the Council of Ministers Iv. Shpatov

Ordinance on Trade and Artisan Business by Citizens.

Section I

Artisan Activity.

Article 1. (1) Citizens may have artisan business involving services and production of small articles for public consumption, as well as art objects created by art professionals by observing this ordinance as well as other normative acts.

(2) The socialist organizations may assign by contract to licensed artisans the production of deficit goods, semifinished products and spare parts by supplying them with the necessary raw and other materials.

Article 2. (1) Artisan services that may be performed by citizens are determined by the executive committee of the obshtina (district) people's council on the basis of nomenclature and normatives on consumption approved by the Ministry of Internal Trade and Services.

(2) In view of meeting specific needs in some inhabited places as well as in cases of nonexistent government or cooperative organizations for performing specific services, the obshtina (district) people's councils may allow artisan services by citizens not bound by the nomenclature and normatives of the preceding paragraph.

(3) Small articles for public consumption that may be produced by artisans and other citizens are determined by the executive committees of the obshtina (district) people's councils whereas art objects produced by art professionals, by the Ministry of Internal Trade and Services and the Committee on Culture.

Article 3. (1) Artisan work may be done only by persons who are competent and have the appropriate professional qualifications.

(2) Competency or professional qualifications are certified by master of craft certificate, diploma for specialized education, certificate for retirement in the respective field or completed schooling or courses, or by other documents specified by a normative act.

(3) Certificate for competency or professional qualifications is not needed for work not requiring special qualifications such as shoe shining, chimney sweeping, house cleaning and others of the same type.

(4) The chairman of the executive committee of the obshtina (district) people's council may make an exception and allow artisan work by persons who have long experience in the respective field but do not have a certificate for competency or professional qualifications.

Article 4. (1) Permission for artisan work is given to:

1. Disabled soldiers or partisans;

2. Persons trained under the auspices of TELK [Labor Expert Medical Commission];

3. Retirees;

4. Citizens who work by contract on the side, not during worktime;

5. Citizens not included in the preceding items who do not work by labor contract and are suggested by the respective state labor inspectorate.

(2) Permission for artisan work is not granted to persons:

1. Who have not paid their taxes and other state loans;

2. Who have been charged with systematic violations in exercising their artisan work.

Article 5. Permission for production of small articles for public consumption and for items produced by art professionals is granted when the requirements under Article 4 are met, as well as the following conditions:

1. To have an approval protocol by the council on design of the Scientific Center on domestic trade, services and local industry at the Ministry of Internal Trade and Services;

2. The products to meet the existing standards, specific norms or technological requirements.

Article 6. Refusal of permission to run an artisan small business, to produce small articles for public consumption or art items by art professionals may be appealed according to the Law for Administrative Production, and the notices of appeal, through administrative channels, are examined by the chairman of the executive committee of the okrug people's council.

Article 7. Permits for small artisan business activity is issued for 3 years by the chairman of the executive committee of the obshtina (district) people's council or by another official of the executive committee designated by the council. Copy of the permit is sent to the department of "Finances" of the respective obshtina people's council at the person's place of residence.

Article 8. (1) The permit is personal and cannot be transferred to other persons. It applies for the specified type of work and place of work.

(2) Persons with permits for artisan work as well as producers of small articles are not allowed to hire workers under any circumstances. They may be assisted without any labor agreement by their spouses and children over 16 years of age provided they are members of the same household.

(3) Art professionals as an exception are allowed to train two students up to 2 years.

(4) Students' remuneration and method of establishing acquired qualifications are determined by the Ordinance of Labor Remuneration of Students trained in Production, approved by Decree No 120 of 25 July, 1962, issued by the Council of Ministers. The duration of the students' training is considered as labor training. The licensed artisan himself pays the students' deposits in the state social insurance.

(5) The students must be from 16 to 25 years of age, and the edicts of the Labor Code have to be observed.

Article 9. Licensed artists and producers of small articles for public consumption may sell their products to state and public organizations as well as to private citizens at established prices.

Article 10. (1) Licensed artisans and producers of small articles buy from the trade organizations the necessary raw and other materials as well as spare parts at retail prices.

(2) The executive committees of the okrug people's councils plan, following the line of the material-technical supply, those raw and other materials for the needs of the licensed artisans which, due to their specificity, cannot be sold through the trade system.

Section II

Trade Activity

Article 11. Citizens may sell retail some products specified by the Ministry of Internal Trade and Services.

Article 12. (1) Trade permits may be granted to persons who do not work by labor contracts who fall under the following categories:

1. Disabled soldiers or partisans;

2. Persons trained under the auspices of TELK;

3. Retirees.

(2) Citizens falling under the preceding item must meet the following conditions:

1. They must not have been deprived of the right to hold jobs involving financial and materially responsible matters;

2. They must not have any contagious diseases;

3. They must have paid their taxes, fees, and any other state loans;

4. They must not have been charged with systematic violations of the trade rules.

Article 13. (1) A trade permit is issued by the chairman of the executive committee of the obshtina (district) people's council or by another member of the executive committee designated by the chairman.

(2) A trade permit is granted for 3 calendar years and is valid for a specific inhabited place and for some types of goods specified in an itemized list issued by the Ministry of Internal Trade and Services. A copy of the

permit is sent to the department of "Finances" of the respective obshtina people's council at the person's place of residence.

Article 14. Refusal of a trade permit may be appealed following the Law on Administrative Production and the notice of appeal is examined through administrative channels by the chairman of the executive committee of the okrug people's council.

Article 15. (1) The trade permit is personal and only its owner has the right to be engaged in trade.

(2) As an exception, if the person in question needs an assistant due to physical disability, he must present a certificate issued by the respective medical authorities. The official employee, according to Article 13, Par 1, may allow the use of an assistant after evaluating the case, which should be marked in the permit (name, number of passport, and other data).

(3) The assistant may be the spouse, a blood relative or a relative by marriage no more than twice removed. In case of no relatives the authorities may allow according to Article 13, Par 1 the use of another person as an assistant. The assistant must meet the conditions of Article 12, Par 2, Item 1.

Article 16. (1) The persons involved in trade by this ordinance are supplied with products from the socialist organizations only upon presentation of valid documents.

(2) The persons referred to in the preceding paragraph must sell the goods at the established retail prices.

Section III

Administrative and Penal Edicts

Article 17. (1) For systematic unfulfillment of orders and services within the contractual time-table, for poor quality work, for services and sale of goods at higher than the established prices, for violations in trade rules, for systematic failure to pay taxes and respective insurances, for violations in tax accounting and for services or trade done by persons not mentioned in the permit, the party that has issued the permit may invalidate or rescind it for not less than 30 days and up to 2 years.

(2) In case of invalidation, the authorities that have issued the permit determine a suitable liquidation period.

Article 18. (1) Violators of Article 17, Par 1 are punishable by a fine not to exceed 200 leva as per Article 32 of the Law on Administrative Violations and Penalties provided they are not liable for stricter punishment.

(2) The penal decrees are issued by the authorities following Par 2 of the Closing Edicts on the basis of indictments by same authorities.

Closing Edicts

Par. 1. The methodical management and supervision in the field of industrial aesthetics concerning the production of goods for public consumption, art objects by art professionals, as well as the quality of the goods, is done by the Committee on Culture, the Ministry of Internal Trade and Services and the State Committee on Standardization.

Par. 2. The supervision following this ordinance is entrusted respectively to the minister of Internal Trade and Services, the minister of Finance, the chief of the Central Administration on Prices at the State Committee on Planning, the chairmen of the executive committees of the people's councils and the organs authorized by them.

Par. 3. This ordinance is issued on the basis of Pars 3 and 4 of the preceding and closing edicts of the Law on Property by Citizens and abrogates:

1. Decree No 12 of 1974 by the Council of Ministers (D.V. issue No 20 of 1974) and the approved ordinance with it concerning artisan and trade activity by citizens;

2. Item No 15, Par 2 and Item 17 of Decree No 34 of 1971 issued by the Council of Ministers.

(2) This ordinance does not apply to members of the Society of Art Professionals.

EXAMPLE OF BLATANT IRRESPONSIBILITY NOTED

Sofia TRANSPORTEN GLAS in Bulgarian 13 Aug 80 p 5

[Article by Petur Khvurchilkov: "One Spoonful of Kerosene Spoils a Bucket of Milk"]

[Text] In the last issue we printed detailed information on the national conference of the leading cadres of the Bulgarian State Railway SO [Economic Trust] which took place in the capital on 4 August of this year. Discipline emerged as the most urgent task facing the railroad transport in 1980. The question of firm and conscientious labor and technological discipline was raised most acutely in the report of the director general as well as in the speech of Minister Vasil Tsanov. Our country is approaching an important forum, the 12th Congress of the Bulgarian communists. In honor of this historic event in the life of the party-leader, it is the duty of the railroad workers, together will all Bulgarian people, to use their best efforts in staging a meritorious welcoming of the congress. But, in order to fulfill their great and very important share in the all-round economic and cultural progress of the country, the most important thing for the railroad workers is discipline, discipline and again discipline. Discipline in every endeavor and everywhere, in the entire complicated operational process. The most important goal in this respect is to reach the state of absolute infallibility and to observe most strictly the traffic schedule of the trains. These two elements are also the basis of the inspiring call that the participants in the conference addressed to all railroad workers in the country.

And, just when a change was at hand, when tens of thousands of railroad workers were captivated by the inspiring words of the participants in the conference and were ready to turn these words into deeds, the traffic on the four railroad track was interrupted for 12 hours, the schedule of hundreds of express, local and freight trains was fouled up and thousands of railroad workers could not fulfill their plan because of a few negligent, undisciplined workers, persons with low feeling of responsibility. What happened could be described by the proverb: "One spoonful of kerosene spoils a full bucket of milk."

One of the railroad cars of train composition No 40649 derailed between Dryanovo and Vurbanovo stations, damaged partially 6,500 meters of track, ruined the entry signal system at Vurbanovo Station and stopped all traffic for about 12 hours.

The reasons:

On 5 August the personnel of the repair and reconstruction enterprise had finished some basic repair work on the railroad line from Vurbanovo to Dryanovo. When reaching the bridge over the Dryanovska River, they had not removed the ties nor evened up the ballast under them. Between the last 4-5 joints the ballast had been evened up but at the place of the passage it had made a "threshold." The inspector Vasil Venkov of ninth railroad section in Gorna Oryakhovitsa had checked the work and discovered the existence of a "threshold," ordered that it be evened out and had gone to the near-by crossing without checking later on whether the mistake had been corrected. The technical manager of the RVP, Yordan Stanchev, had arranged the instructions of the inspector to be followed. The instructions were followed but not the correct way. The following day Gorcho Vurbanov, the other technical manger of the RVP, had simply passed by the place in question and had confirmed that the ballast was corrected without any flattening of the bed but he on his part did not do anything about it. He simply forgot that on 17 May of this year, under similar circumstances, the personnel of their station had caused the derailment of four cars of train No 40647 in the neighboring stretch between Dryanovo and Sokolovo stations and the traffic had to be interrupted for 13 hours. But, we should open brackets here. Gorcho Vurbanov might in fact have forgotten the accident since up to today, 8 August, the RVP leadership had also forgotten to punish the culprits of the 1 May accident. (You may draw your own conclusion, dear readers, for the discipline from the top to the bottom ranks.)

And so, at about 1700 on 7 August, train No 40649 lost its 13th car when passing the "threshold" in question. The train, pulled by two locomotives 43-106 with machinist Georgi Boldov and assistant Petur Marinov and 42-71 with machinist Ivan Nikolov and assistant Milko Denev, dragged the derailed car on the cross-beams for 6.5 kilometers. In the meantime the 13th car, remember, not the 50th but the 13th, was rattling, breaking cross-beams, throwing stones and making sparks and in the course of 17 minutes (the time of the unfortunate trip) nobody of both locomotive brigades ever turned around to check the condition of the train.

In fact there was someone, a watchful and alert railroad worker: the ticket clerk at Bacho Kiro Station, Rayna Kuncheva or Grandma Rayna as the railroad workers call her. She was sleeping peacefully at the station but, hearing the clamor, she dashed out and, realizing the trouble, immediately called Vurbanovo Station.

"Stop the train immediately! A car has been derailed!"

But the answer of the traffic managers Khristo Velev and Nasko Atanasov was most categorical:

"Impossible! It is on 'go'."

"Break the seals immediately or else we will have an accident," the ticket clerk ordered, but this time too the answer was:

"Impossible! The order is not to stop it."

Grandma Rayna was horrified. The old railroad veteran realized the tragic end due to inactivity, apathy and lack of most elementary foresight and professional alertness on the part of the managers of Vurbanovo Station.

She again ran to the tracks, saw the marks and the broken, supposedly brand new cross-beams of the just reconstructed railroad bed and picked up the telephone again in even greater rage. Kolyo Kolev, chief on duty at Dryanovo Station, heard her and immediately called the district dispatcher Iliya Papasov and relayed the pressing alarm signal.

Instead of immediately ordering the train to be stopped and the electric circuit to be shut off, Papasov ordered:

"Call her again to check whether any car has derailed."

In the meantime, instead of taking the matter into his hands, the Vurbanovo traffic chief also called the dispatcher, asking him:

"What shall I do?"

The dispatcher did not answer. Time was passing fast. The train was moving. The car continued to damage the newly repaired tracks.

At about 1740 Vurbanovo informed the dispatcher:

"Two cars derailed and hit the signals..."

And the dispatcher, quiet until that moment, answered curtly:

"Why didn't you stop it! Didn't I tell you???"

The incident does not need any comments. The inquiry protocol will be full of conclusions, proposals, decisions. It might be proper for the prosecutor's office to express its competent opinion as well. The conclusion, however, will be the same, i.e. that the gross irresponsibility and lack of discipline of a bunch of people, blind to the work and efforts of thousands of their comrades, should not remain unpunished.

CAUSES FOR FREQUENT BREAKDOWNS OF ARMORED VEHICLES EXAMINED

Struggle Against Accidents

Sofia VOENNA TEKHNIKA in Bulgarian No 7, 1980 pp 1-2

[Article by Col Engineer Penyu Kostadinov, candidate of technical sciences]

[Text] The commanders, staffs, and technical services of a number of units properly assess the role and place of ABTT [Armored Vehicles] in resolving the complex set of problems and paying great attention to its proper utilization and maintenance, and tirelessly struggle against accidents. Ever greater attention is being paid to the elimination of the prerequisites which result in accidents and breakdowns of the machines. Active efforts are being made to improve the material and technical base for the servicing, repair, and storing of the equipment.

An efficient organization for allowing the vehicles to run has been introduced in the units where officers Ivanov, Iliev, Apostolov and Khristov serve. Their use, servicing, and storing are fully consistent with the requirements of the Internal Service Regulations and the Instruction on ABTT Support in the Bulgarian People's Army.

The study and analysis of the reasons of accidents in such units is a main aspect in the struggle against them. Such studies make it possible to determine more completely the role of factors such as shortcomings in the training and education of the personnel, violations of the utilization, servicing, repair, and storage of the vehicles, omissions in the organization and implementation of the parking services and insufficient army discipline, as well as to earmark and carry out activities for their elimination. Ever more active work is being done in the units where officers Stanev, Sokolov, Nedelchev, Markov and others serve to improve the training and upbringing of the command and other personnel. Their success is due to the precise implementation of the program and the courses on technical training and driving and the bold introduction of the new element in training: the gaining of maximum practical knowledge and skills.

Precision in the work of the commanders and the engineering-technical personnel in the units where officers Krustev, Kamburov and Dimov serve contributed to the development of a good organization in the servicing, repair, and protection of the vehicles. Diagnostic and control equipment is extensively used. That is why in these units the equipment may be used only if it is in proper shape and ready for combat activities.

The positive results achieved in the struggle against accidents should not reassure commanders and technical services, for the necessary results have still not been achieved in some areas. A great deal of breakdowns are possible which disturb the combat readiness and the training process in the units and result in unjustified material expenditures.

Studies have indicated that the nature of accidents involving armored vehicles may vary as much as the reasons for such accidents. In the units where officers Ivanov and Todorov serve the engines of the vehicles broke down as a result of an oil leak through cracked rubber seals. In the unit where Officer Tomov serves, a motor vehicle overturned and fell in the road ditch as a result of the loosening of the bolts of a wheel which fell off while the vehicle was in motion. These examples indicate that technical servicing (whether daily, periodical, or seasonal) and repairs (current, medium, or capital) have been substandard and vehicles in improper working order were kept in the garage. These units failed to create a good servicing and repair organization in the course of which all operations stipulated in the instructions and manuals for the corresponding models must be carried out in full.

A number of changes take place in the vehicles in the course of their lengthy storage as the result of atmospheric influences and physical and chemical processes affecting metal, rubber, leather, and tarpaulin parts. The cracking of rubber seals in the systems, premature wear of cylinder-piston sets, and others indicate that some officials ignore the rules governing equipment storing, fail to observe the changes closely, and do not promptly correct malfunctions. We know that when a vehicle remains unused for a period of over 15 days its engine should be protected. Investigations have indicated that a number of commanders and technical services do not protect machine units and vehicles or process them strictly in accordance with regulations. All this adversely affects their reliability and, later on, leads to breakdowns and accidents and to performance failures. The periods allocated for the checkup of parked vehicles are not used most efficiently.

The garage duty personnel do not always demand that the crews, teams, and drivers strictly observe internal regulations. Violation of such regulations create prerequisites for accidents in the garages themselves, such as the outbreak of fires in the vehicles, freezing and cracking of engines as a result of undrained water from the cooling system, damages

to the light signaling systems, failure to maintain the necessary temperature of the water in water heaters, and so on. There have been cases in which poor internal order in the parking areas has enabled the drivers to take out vehicles on their own with improper documents. Occasionally such violations also involve the use of alcohol as a result of which the final consequences are most undesirable.

An important feature in the use of ABTT is preparations for use. We know that proper preparations of engines and vehicles prevent premature wear and tear and breakdowns of mechanisms and machine units. The study of accidents shows that a high percentage of breaks are due to violations of the technological procedure in preparing and switching on the engines. Control checks are ignored, the engines are not warmed up to the necessary level, and operational systems are violated. The engineering and technical personnel are well familiar with the fact that the greatest wear of the crank shaft-connecting rod mechanism takes place at the starting of the vehicle. Some commanders who do not demand the use of individual vehicle heaters and the maintenance of the necessary temperature of the water in the water heaters poorly help the combat readiness. The preparation of the vehicles for running should also involve a checkup of their technical condition by subunit commanders and the giving of instructions to the driver and vehicle commander. In checking the condition of the vehicles before starting, the commander of the KTP [Technical Check Point] should act as the final barrier blocking the use of vehicles in improper condition. Here again statistics prove that despite such control organs vehicles are allowed to leave the parking area with improper cooling and lubrication systems and units, loose parts, improper lights, and unchecked brakes. The result is the overheating of engines, improper functioning of bearings, the cracking of crankcases, and others.

Still accounting for a large number of accidents are the insufficient knowledge and practical skills of the personnel handling ABTT. This involves, above all, breakdowns from overheating of engines and breaks of transmission units as a result of overloads in crossing terrains ignoring the possibilities of the vehicles, the hydraulic shocks experienced by the engines in improper crossings of waterways, or the melting of bearings as a result of ignoring the readings of measuring devices. Accidents as a result of poor personnel training indicate that some units are still underestimating the significance of effective technical training and driving involving officers, mechanics, and drivers. The engineering and technical personnel must become more actively involved in organizing and controlling the implementation of measures based on the weekly cycle by the subunits. Here purposeful technical training must play a definite role.

A high percentage of accidents are the result of lack of discipline as well. This proves violations of the regulation on the application of the law on street and road traffic. Speed limits are exceeded, vertical and horizontal signs are ignored, and wrong light and sound signals are

given. Deviations are allowed from road schedules explained and ordered in advance, use of alcohol, improper loading and transportation of personnel, and violation of rules governing the operation of the vehicles. Not only the immediate violators but commanders, staffs, political organs, and technical services must be held liable for such violations, as they have been unable to formulate a strict statutory procedure and have failed to struggle for the elimination of prerequisites leading to the violation of discipline and of regulations, orders, and instructions. Lack of discipline also leads to accidents involving privately owned vehicles by military personnel.

Equally noteworthy in the study of accidents is the seasonal factor in the period when the highest number of breakdowns occurs. Experience has indicated that at peak traffic times the rate of accidents declines instead of increasing. This is the result of improved organizational work and control on the part of commanders at all levels. Hence the conclusion that our struggle against accidents could be more effective when it involves the participation of the entire army and when active work is done to eliminate prerequisites which lead to breakdowns and accidents.

Political organs and party and Komsomol organizations could actively help commanders and technical services in the noble struggle for reducing ABTT accidents. They could help to organize, manage, and keep track of the socialist competition among collectives and promote in the personnel a feeling of love and socialist responsibility for assigned ABTT.

Engine Breakdowns

Sofia VOENNA TEKHNIKA in Bulgarian No 7, 1980 pp 7-9

[Article by Major Engineer Krasimir Milanov]

[Text] In a number of cases determining the real reasons for breakdowns of ABTT engines is a complex procedure which could be performed by highly skilled investigative military personnel.

Experience in armored vehicles support in large units and units has indicated that in the study of ABTT engine breakdowns a scientific approach must be applied, requiring extensive and profound knowledge of specifications and of the foundations of the operation of vehicles by specialized military personnel.

Statistical data show that the investigation of breakdowns are not always successful. Their real reasons are not established. In most cases this is noted in the case of vehicle engines whose maintenance and observance of necessary operational rules require greater experience on the part of the operational personnel.

There are many types of engine breakdowns. Some of them, however, are standard.

The breakdown of cylinders and pistons is the most frequent. It is manifested in the premature wearing out, break or tear of the piston and the deep grooving of the smooth surface of some of the cylinders.

The main reason for the intensive wearing out of the cylinders along their entire length is the penetration of abrasive materials through the section pipe along with the air, oil, and fuel, through the vents in diesel engines, and the forced ventilation system of crankcases in carburetor engines, or through cracks, particularly where the air blower connects with the suction collector. The area of the most intensive wearing of the cylinders depends on the line of penetration of the dust. Should dust enter the engine through the suction pipe, the biggest wear is in the upper part of the cylinders and the piston rings. Should dirty oil be used the biggest wear is in the middle part of the cylinders which results in the fast breakdown of the oil piston rings.

The reasons for the intensive wearout of the cylinders near the top dead center is the highly active nature of the corrosion processes which develop when the temperature of the mixture is below that of the spraying point. When engines work at a temperature of the cooling liquid and oil not exceeding 60°-70°C, the heat on the cylinder walls does not reach 100°C and water vapors condensate on them. Since the combustion products also contain a certain amount of sulfurous gas favorable conditions are created for the formation of sulfuric acid which corrodes the cylinder walls (Fig. 1). Particularly strong corrosion develops on the walls of cylinders with carburetor engines left unprotected for short periods of time, as a result of which they wear out far more intensively.

Past experience in the operation of motor and armored vehicles has indicated that by removing the engine head each 20,000-25,000 kilometers and after numerous short preservation procedures a typical edge caused by the wearing out may be seen in the upper part of the cylinders (8 to 10 mm from the dividing surface), while the radial slackness of the pistons has increased. This, as well as the reduced strength of the material at high temperatures, deforms the piston and results in its break and the grooving of the cylinder.

It is quite frequently believed that a broken piston entails the twisting of the connecting rod and to the melting of the connecting rod bearing. It would be logical to assume the opposite. The melting and tearing up of the connecting rod bearing blocks the free movement of the lower end of the connecting rod, increases the radial pressure on the piston, and deforms both piston and connecting rod.

These deformations lead to the subsequent destruction of the piston. This is exemplified by some cases in which the piston has been broken, the connecting rod twisted, and the connecting rod bearing has been torn.

The main reason for the breaking of the pistons of carburetor engines in the area of the oil piston ring is excessive temperature. Gunning the engine with insufficient cooling raises the temperature of the upper part of the piston head. The slack between it and the cylinder is reduced and a tightening may result when it reaches 0.02 mm. The cyclical tightening results in cracks which frequently wreck the piston even when the engine is operating quite normally.

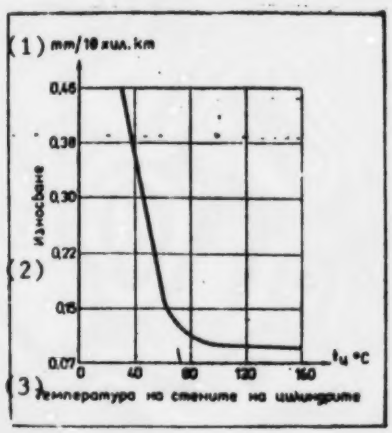

Fig. 1.

Key: (1) Millimeters per 10,000 kilometers
(2) Wearing out
(3) Temperature of cylinder walls

Another frequent breakdown is the piercing of the cylinder block or the crankcase. This is the result of a hard blow dealt by a broken or released connecting rod if the faulty engine is not stopped on time. The upper head of the connecting rod, released when the piston is broken or torn out may pierce the cylinder block.

The break of the connecting rod bolts is a dangerous breakdown in the connecting rod unit. This may be caused by excessively tightened bolts which lead to a deformation of the lower head, excessively loose bolts, or a substantial slack in the connecting rod bearing.

As a rule, the so-called hydraulic shock in tank engines leads to the bending and, subsequently, breaking of the connecting rod and the piercing

of the cylinder block or the crankcase. The water may penetrate the cylinders through the air filter or the release pipes should the tank take water or in the course of its washing, as well as should the tightness between the cylinder block and the head be disturbed.

Another frequent accident involves damages to the bearings of the crankshaft, manifested through the cracking, tearing of, shifting, or melting of the antifriction alloy, the turning of the bushings or the breaking of the lower bearing caps. The main reason for the tearing, dragging, or melting of the antifriction alloy and the grooving of the crankshaft pin on the side of the bearing is the shortage of oil. This results in dry or semidry friction and insufficient heat conduct. In such cases the bearings rapidly overheat and the melting or mechanical destruction of the alloy begins.

Reasons for insufficient lubricant reaching the bearings of the crankshaft may include various defects of the lubrication system and, above all, a violation of driving procedures. Thus, for example, someone may fail to lubricate the bearings, the engine may be started with an insufficient amount of oil in the oil pan or the crankcase, the oil headers may be blocked, an element of the lubrication system may have been destroyed (pump, pipe, rubber seal), or a change in the quality of the oil as a result of the penetration of antifreeze or fuel.

In the period of starting and warming up the engine, the temperature does not match the give of the bearings. The durability of bearings made of tin bronze may be maintained providing that the temperature on their surface does not exceed 140°C. Fig. 2. shows that this is achieved when the released oil ranges from 30 to 110°C according to the regulation heat guage for V-2 engines.

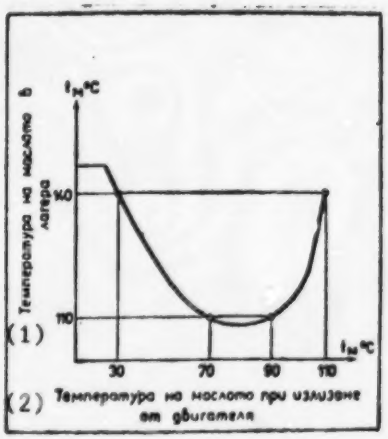

Fig. 2.
Key: (1) Oil temperature in the bearing
(2) Temperature of the oil leaving the engine.

Sometimes the seventh and eighth main bearing of the crankshaft of tank engines may break down. This is the result of the improper alignment of the engine with the gearbox or the reduction gear. Should such nonalignment exceed the admissible level, the additional stress required results in the overloading of such bearings. In the long run, this damages the antifriction alloy of the bearings which melt.

The play between the bearings and the crankshaft pins may increase as a result of the wearing out of the bearings in the course of the running of the engine. An excessive play of up 0.25-0.30 mm causes shock stresses and pushes the oil out of the bearings. Cuts and tears appear along the pins. Such shock stresses occasionally lead to the tearing and the overturning of the bushings, particularly in carburetor engines, as a result of which the oil conduits are blocked and the flow of oil to the bearings is interrupted. The running of an engine with melted or torn bearings immediately and rapidly result in their destruction and the jamming of the crankshaft.

The breaking of the crankshaft is a frequent accident. Essentially, this is due to metal fatigue. Usually, the destruction begins in the areas of stress concentration: the shoulder to the pins, the end of the oil grooves of the pins, or the key groove at the front end of the crankshaft.

The stress on the crankshaft is increased considerably in the running of diesel engines at high RPMs, which may lead to its dropping. The uneven control of the fuel supplied or the beginning of the injection into the cylinders may add as much as 15 percent to the stress of the crankshaft.

In the case of vehicles with two parallel engines GAZ-40P and GAZ-49B, should the connectors not be coordinated for simultaneous starting, a high overload of the crankshafts develops. This is the main reason for the break of the crankshaft at the sixth connecting rod pin and in the area of the transmission from the sixth connecting rod to the fourth main pin. An excessive shaft bending may develop also in the area of transition to other pins in the case of the tightening or sticking of the piston in the cylinder should the engine overheat. The loosening of the bolts of the belt rings in such engines increases the overload of key joint, and leads to fatigue and break of the front end of the crankshaft.

A damaged sealing of the cooling jacket of the cylinder block and cylinder head is a frequent phenomenon. It shows in the deforming and cracking of cylinder heads and blocks, and the loss of elasticity of the packing rubber rings of the cylinder sleeves. Usually, this is the result of overheating or freezing of the coolant in the engines.

Overheating occurs when the vehicle is driven in an unsuitable gear, with closed radiator shutters, a dirty cooling surface of the radiator, spinning of the friction clutch or the fan belt, or blocked circulation of the fluid in the cooling system.

Starting the engine with a partially filled cooling system or loss of some of the coolant as the vehicle is driven, leads to overheating. This may occur in the course of preparations for taking the motor vehicles outside the parking areas should the alarm signal be given. The drivers must carry a 20-liter jerrican filled with water. Because of the loss of some of the water 18 to 19 liters of water are poured into the system whereas the capacity of a ZIL-157 is 22 liters. For this reason the cooling of some areas of a running engine is disturbed.

The local overheating of cylinder walls and, particularly, of the combustion chamber is the result of the blocking of the coolant throughout a highly heated engine. The circulation within the system stops, extensive steam is formed in the water jacket of the block and the head, the pressure in the system rises sharply, and some of the coolant may spill out.

The proper investigation, determination, and study of the reasons for ABTT engine breakdowns would enable the serviceman-specialist to reach proper conclusions. This is an important prerequisite for effective action in the struggle against accidents involving the ABTT of an army unit.

MISSION, COMPOSITION OF PEOPLE'S POLICE ALERT UNITS DESCRIBED

Bonn INFORMATIONEN in German No 13, Aug 80 pp 14-15

[Background report by FRG Ministry for Inner-German Relations: "GDR Newspaper Reports on Composition and Tasks of People's Police Alert Units." The two East German articles discussed below are both published in Neubrandenburg FREIE ERDE in German 15 Jul 80 p 4, as follows: "At the Beginning Is the Drill: A Training Day With the Men of Our Police Alert Units," by Gunther Pickroth; and "An Important and Fine Profession--Three Questions Addressed to Lt Col Horst Schewe, CO, Hans Kahle Alert Unit, People's Police"

> [Text] In mid-July of this year FREIE ERDE, the organ of the Neubrandenburg SED Dezirk Command, printed two reports on the People's Police Alert Units, which comprise over 18,000 soldiers, and have been an official part of the core of the GDR territorial defense forces since 1970. For the first time in the GDR, comprehensive information was supplied on the structure and the duties of these military units, which had so far hardly been mentioned by the press in contrast to the National People's Army [NVA] and the Border Troops.

The first units of this type had been established by the Ministry for State Security as early as 1950. As of 1955 they were termed "Internal Troops," were then renamed People's Police Alert Units 1 year later and came under the command of the GDR Ministry of the Interior (MdI) in 1957. In 1961 they were utilized to build the Berlin wall, and in 1970 they participated in the "Brotherhood-in-Arms" maneuver of the Warsaw Pact nations as part of the territorial defense forces. According to the Conscription Law of 1962, service in the People's Police Alert Units is regarded as alternate military service and is thus considered equal to military service. One of the FREIE ERDE newspaper reports comments as follows:

--"Alternate military service? Nothing is secondary here--this entails military service as in the army; military training and modern military

technology determine daily life, just as in a motorized gunners' unit." In another article, Lt Col Horst Schewe, commander of the Hans-Kahle People's Police Alert Unit, Neustrelitz, comments on the duties of the Alert Units in detail:

--"The Alert Units of the German People's Police are militarily structured, fully motorized units with modern equipment and weapons, accommodated in barracks. They are capable of solving various police tasks and other major tasks. These units are utilized when major disturbances or dangers affecting public order and safety, i.e., large fires, explosions, or disasters due to floods or snow drifts, or cases of average are about to happen or have happened. The ultimate aim is to protect our citizens and our economy against jeopardy."

According to Schewe, the units are also used to "provide security during large events or to help search for dangerous violators of the law." Further, they are "fully integrated into the socialist national defense system and are able to "perform acts for the defense of our home country in case of imperialist aggression."

The training of the Alert Unit policemen is an "allround training," according to Schewe, which he understands as "exercise and drill training, training in marksmenship and protection, tactics, political training, military physical education, and instruction of military regulations." Schewe says, "Their armament can be equated to that of a motorized gunners' unit of the NVA."

One characteristic of the Alert Units is that the troops and noncommissioned officers have the ranks of the German People's Police; the officers, however, have the ranks of the NVA. The three groups (staff sergeants, troops, noncommissioned and commissioned officers) can be broken down as follows:

--Staff sergeants:
Candidate of the People's Police
Under-Staff Sergeant of the People's Police
Staff Sergeant of the People's Police

--NCO ranks:
Senior Staff Sergeant of the People's Police
Chief Staff Sergeant of the People's Police
Master Staff Sergeant of the People's Police
Senior Master Staff Sergeant of the People's Police

--Officers:
Second Lieutenant of the People's Police
Lieutenant of the People's Police
First Lieutenant of the People's Police
Captain of the People's Police
Major of the People's Police
Lieutenant Colonel of the People's Police
Colonel of the People's Police.

According to a FREIE ERDE report, the noncommissioned officers are obligated to a "minimum of 10 years service." Following their basic training they attend a school for noncommissioned officers and are then utilized as assistant platoon leaders.

Career officers must be obligated to a minimum of 25 years in the service. In order to be accepted, graduation from high school and completion of vocational training are required. The officers are trained at the Officers' University of the MdI Alert Units in Dresden. Following a 3-year course of study the students are conferred the equivalent of a master's degree in industrial engineering and the rank of a lieutenant. When returning to the troops, they normally work as platoon leaders and may subsequently "qualify as company commanders, staff officers, or political officers," according to Lt Col Schewe.

The individual alert units are stationed in barracks in or near the 14 district cities; two units each are stationed in the industrial districts. In Basdorf near East Berlin three alert units are available as additional security forces for the government residential area near Bernau.

In one of the SED newspaper reports training of alert unit policemen in a floatable armored personnel carrier is addressed, among other things; one officer comments as follows: "The armored personnel carrier is a true child of Socialist economic integration. The hull and motor come from Hungary, the weapons from Romania, the tires from the CSSR, and the optical and radio equipment come from the Soviet Union."

BIOGRAPHIC SKETCHES OF MINISTRY OF CULTURE OFFICIALS PUBLISHED

Budapest KOZNEVELES in Hungarian 5 Sep 80 pp 4-5

[Text] As our readers know the Presidium of the Hungarian People's Republic enacted a decree of legal force establishing the Ministry of Culture. The combined functions of the former Ministry of Culture and the Ministry of Education will devolve upon the new ministry. It will also be in charge of those aspects of skilled worker training which were formerly under the jurisdiction of the Ministry of Labor.

Biographic sketches of ministry officials follow:

Minister of Culture Imre Pozsgay was born in 1933 in Kony in Gyor-Sopron County. He studied history and Marxism-Leninism at the faculty of education of the Lenin Institute. He is a candidate of philosophy. From 1957-1965 he was the head of the night school of Marxism-Leninism of the party committee of Bacs-Kiskun County. From 1965-1970 he was in charge of the department of agitation and propaganda of the county party committee. In 1970, he became subdepartment head of the department of agitation and propaganda of the Central Committee after which he became deputy editor-in-chief of TARSADALMI SZEMLE. From July 1975 he served as deputy minister in the Ministry of Culture; later as Minister of Culture in 1976 and is now Minister of Culture since the reorganization. He has been a party member since 1950. He was elected member of the Central Committee at the XII Party Congress.

Andras Korcsog, state secretary, was born 1931 in Bekescsaba. He completed secondary school at Szeged and Bekescsaba. He obtained his decree as chemical engineer in the field of oil and coal processing from the Chemical Industry University of Veszprem in 1954. After working briefly for the Petroleum Industry Enterprise, he acted as secretary of the youth organization of the Veszprem University till the fall of 1956 after which he became a teacher at the same institution. Between 1964-1967 he worked in the Department of Science, Education and Culture of the Central Committee of the MSZMP. He returned to Veszprem in 1967 where he was deputy rector of education from 1967-1973. From 1974 until his appointment as State Secretary he worked for the Department of Science, Education and Culture of the Central

Committee of the MSZMP where he dealt with scientific-political matters. He has been party member since 1953. He has held various offices: university party secretary, member of the city executive committee and member of the county party committee. In addition to being general deputy for the ministry he is in charge of higher education.

Jozsef Drecin, deputy minister was born in Arad in 1929. Originally an iron turner, he completed his education at the faculty of theoretical sciences of the University of Economics in Budapest. He worked in the National Planning Office from July 1952 to July 1980. He is member or official of a number of scientific organizations including the Society for Organization and Management of which he is head; vice chairman of the MTSZ [expansion unknown]; member of the committee of the economic society; economic columnist of the periodical, GAZDASAG; also member of the editorial committee of the aforementioned periodical. His publications in the field of economic policy, investment policy and management are known at home and abroad. He taught political economics at the night school of Marxism-Leninism for several years. He has been member of the party since 1946 and associated with the workers' movement since 1945. He is now in charge of the economic affairs of the ministry.

Maria Hanga, deputy minister, was born in 1939 in Koka. She received her teacher's diploma at the teachers' training school in Kecskemet and taught for two years in Pest County. She resumed her studies at the Faculty of Philosophy of the Lorand Eotvos University of Science. She became secondary-school teacher specializing in Hungary and Pedagogics in 1965. Later that year she transferred to the Mihaly Fazekas Practical Grade School and Gymnasium in Budapest. For 4 years she was member of the KISZ Central Committee. In 1972 she began working for the Department of Science, Education and Culture of the Central Committee of the MSZMP. She served as deputy head of said department from 1973-1975. From 1975 up to the present, she has been deputy minister of education. She is now in charge of public education, special education and general cultural affairs.

Ferenc Ratkai, deputy minister, was born to poor peasant parents in 1930. In 1942, he won a scholarship to complete his secondary school studies. He graduated from gymnasium in Dombovar in 1950 after which he studied at the faculty of Philosophy at the Lorand Eotvos University of Sciences from which he received his teaching diploma. From 1953-1960, he worked in the field of book publishing. He then transferred to and became chief of the department of literature in the Ministry of Culture. From 1970 on he was, first, head of a sub-department, then, deputy department head in the Department of Science, Education and Culture of the Central Committee of the MSZMP. He dealt with cultural-artistic matters and international cultural relations. His writings as literary critic, articles dealing with cultural policy and translations have been published. In his present assignment he is responsible for international cultural and educational relations.

Dezso Toth, deputy minister, was born in Budapest in 1925 to a family of civil servants. He completed his secondary education in Budapest. He obtained his teaching diploma from the Faculty of Philosophy of the Lorand Eotvos University of Sciences as teacher of Hungarian-Latin. From 1951-1955 he worked as assistant professor at his university. He then became senior member of the Institute of Literature of the Hungarian Academy of Sciences. From 1961-1964 he was literary chief of the Magveto Publishing House and secretary of the Hungarian Writer's Federation. From 1964-1977 he worked first as member, later as deputy department head of the Department of Science, Education and Culture of the Central Committee of the MSZMP. He became a deputy minister in the Ministry of Culture in 1977. He won the Attila Jozsef Prize in 1964 for his literary critical activity. He became a corresponding member of the Hungarian Academy of Sciences in 1979. As in the past he will be dealing with artistic affairs in the reorganized Ministry of Culture.

COMMENTARY ON 'MORE EFFICIENT' WEAPONS RACE NOTED

[Passages between slant lines appear in bold face type in original]

[Editorial Report] Warsaw SLOWO POWSZECHNE in Polish on 12 September 1980, page 4, in an article by Tadeusz Pioro, entitled, "From the 'Thin Man' to the Neutron Bomb," preceded by a short chronology of bomb production--from the 20-kiloton "Thin Man" bomb in 1945 to the "new, old 'N' bomb"--it is stated that "There is almost not a month that goes by in which information about new 'achievements' in the field of military technology do not reach us. Self-guided missiles, new strategic bombers, gigantic submarines, spy satellites and satellites which destroy other satellites, laser and chemical weapons, increasingly efficient armor and anti-tank weapons, electronic battle systems--/all this transcends the sensible needs of defense./ Technical progress leading to the creation of instruments of annihilation appears to be uncurbed.

"In light of this, all disarmament initiatives, undertaken consistently by the socialist states, take on particular significance. /Also, the declaration which was published on the 25th anniversary of the Warsaw Pact as well as the proposals for the reduction of armed forces in Europe submitted recently in Vienna, and the readiness of the Soviet Union to take up talks on the issue of medium-range nuclear missiles--all this aims at one purpose: curbing the arms race and assuring peace./"

MINISTERS, DELEGATES SPEAK AT PEOPLES COUNCILS CONGRESS

Second Congress Meets

[Editorial Report--The following are the text and excerpts of speeches given at the Second Congress of the Peoples Councils held in Bucharest from 10-12 September 1980. The main speech given by Nicolae Ceausescu, secsecretary general of the Central Committee of the Romanian Communist Party, appeared in the FBIS Daily Report on Eastern Europe of 17 September 1980, Volume II No 182, pages H 10-H 34]

Defense Chief on Cutting Costs

Bucharest SCINTEIA in Romanian 12 Sep 80 p 12

[Speech of Colonel General Vasile Milea, first deputy minister of national defense, chief of the General Staff of the Armed Forces]

[Text] The constant concern of our party and state and of you personally, comrade secretary general Nicolae Ceausescu, for the development of the national economy at a steady pace--the speaker said--is brilliantly demonstrated by the recent decision regarding the increase of funds intended for the implementation of the program for raising the standard of living of the people by reducing military and administrative expenditures and other state expenditures.

We express our firm conviction that this decision serves the highest interests of our nation since the development of the socialist system, the growth of the economic power of the country constitute the bases for strengthening the defense capability of the country and increase the will and determination of the people to defend their revolutionary achievements, their independence and national sovereignty.

For all the members of our armed forces, the decision made recently by the Political Executive Committee of the party represents a mobilizing stimulus for increasing efforts for perfecting the combat training and political training of the troops, providing them with thorough training in the shortest possible time with the lowest possible consumption of fuels, munitions and other materials, the best possible and most efficient maintenance and

use of weapons and combat technology, the avoidance of their premature wear and tear, the elimination of anything resulting in damage or accidents, the strengthening of order and discipline, and the elimination of any possibilities of waste.

We are convinced that, by the more and more effective utilization of the competence and creative capacity of the commands and the staffs, by the growth of the mobilizing force of the party and Union of Communist Youth organs and organizations, the army is ready to increase its combat strength and capacity and to execute, with honor, dignity and high responsibility, its mission of defending, together with all the people, the independence and sovereignty of our country.

On the basis of the concept of our party in regard to the defense of the country and of the military doctrine of socialist Romania, whose brilliant founder is you, comrade supreme commander we will act with all determination for the exact implementation of the orders which you have given to us to extend and deepen cooperation among military units, subunits of patriotic guards and detachments of youth, by joint exercises and instruction activities, by the most effective utilization of the material base for instruction by all forces of our defense system.

Involved in the general effort of the people for the building of socialism --a work which the 12th party congress has given new dimensions--the armed forces are making their contribution to the development of the forces of production and to increasing the national wealth and are participating, shoulder to shoulder with the workers, in constructing 85 industrial projects in the current five-year plan, in the construction of the Danube-Black Sea Canal, the Bucharest metro, and a large number of dwellings, in the construction and modernization of roads and railroads, and in the execution of other projects of national interest.

Inspired by your high esteem, the military men who are participating in the implementation of the broad land amelioration and irrigation program are working with enthusiasm to exceed the provisions of the plan so that by the end of this year, work will be completed on 400,000 hectares, 50,000 more hectares than the initial provision.

Also, participation in the agricultural campaign this fall is considered by the military men to be a mission of high responsibility and they are determined to work with the same self-sacrifice to assure that the harvest will be gathered, transported and stored in the shortest possible time and without losses.

In the coming five-year plan, too, we are determined to honor, with a high sense of duty, the tasks which will be entrusted to us in the national economy, with the firm conviction that by this means the army serves the people and their fundamental interests.

An integral part of our society, the army is an active presence in the social and political life of the country. Cultural and scientific creativity in the armed forces and artistic and military groups are integrated harmoniously--in the manifestations which took place during the "Hymn to Romania" national festival, as well as in the intellectual life of the country and in the cultural and artictic landscape of the localities.

In conclusion, the speaker said: Inspired by the noble ideals of the building of a more just and better world, of a climate of peace, understanding and confidence among peoples, for which the secretary general of the party and the entire nation fight with revolutionary passion, the personnel of the armed forces firmly support the foreign policy of socialist Romania of strengthening collaboration and solidarity with all socialist countries and of expanding relations with the developing states and with all states in the world.

In the spirit of the principles which serve as a basis for Romania's foreign policy, our armed forces develops relations of collaboration with the armies of the countries participating in the Warsaw Pact and of all socialist countries and other friendly countries in the interest of the cause of understanding among peoples, and in the interest of peace and progress.

Fight against 'Parasites, Traffickers'

Bucharest SCINTEIA in Romanian 13 Sep 80 pp 6-7

[Speech of George Homostean, minister of the interior]

[Excerpts] As you have asked of us, comrade supreme commander, we are working consistently so that our entire activity will be carried out under the direct leadership of the party organs, with the broad support of the citizens and with strict observance of socialist legality, by strengthening the education and developing the political discernment of the cadres and increasing their responsibility in their work.

In accordance with the role which they have in the system of our socialist state and with the powers and duties which are given to them by law, the organs of the Ministry of the Interior give top priority to the activity of preventing infractions and other anti-social acts, to preventing unusual events and dangerous conditions in economic units and manifestations of parasitism which are noted in some persons.

As a result of the general development of our society, the improvement of the political awareness, the educational activity carried on by the party and by the state and community organs, and the ever-more powerful affirmation in social life of the principles of socialist ethics and equity, year after year there is a reduction in the number of infractions and various anti-social manifestations.

I would like to stress that the achievements obtained by the organs of the Ministry of the Interior are the result of direct leadership by the Party, of the ever-increasing support which we receive from the workers, of collaboration with the patriotic guards and the detachments training the youth for the defense of the country and of the support which we receive from the leadership of socialist and public organizations. By means of the militia support groups, the order and discipline teams established in those places where infractions might be committed, where there are concentrated different parasitical elements, speculators, gold and currency traffickers, or where disturbances of public order might occur, the Ministry of the Interior organs receive a valuable support in preventing and combating anti-social acts.

In implementing our tasks, we also receive considerable support from the peoples councils which, on the basis of legal provisions, analyze and guide the activity carried on by the local militia organs and firefighters.

Analyzing, in a party spirit, the activity carried on, I report that it has not always been at the level of the demands levied upon us by the leadership of the party and state and by you [Ceausescu] personally. In a number of cases, actions undertaken by criminal elements have not been discovered early enough and, as a result, the most effective measures to nip them in the bud were not taken. Also, the necessary combativeness, firmness and vigilance have not always been demonstrated in regard to these elements which, by their actions, violate the laws of the country and the norms of living together in society, thus causing damage to the national economy, to the personal property of citizens and to public peace and order. There have been situations where we have not made the necessary contributions to the prevention of unusual events in the economy, such as fires and damage, and to the elimination of manifestations of negligence, abuses and lack of responsibility in managing public property and keeping it in the best possible condition. In some cases, we have not acted with sufficient firmness and determination to combat manifestations of parasitism, speculation, illegal traffic in currency and precious metals.

However, we are firmly resolved to eliminate these work deficiencies without delay and to increase the efficiency and quality of our entire activity. We will act constantly for the assimilation and unrelenting implementation of the decisions of the party, of the laws of the land, and of your orders, thus making our contribution to the general successes which our entire people are obtaining. We will place the principal emphasis on the activity of preventing infractions, anti-social acts, and violations of the law, following your directive that the Ministry of Interior organs should consider that they have done their duty only when they have succeeded in preventing infractions and violations of the law. We will watch with determination over the strengthening of socialist legality, demonstrating increased exactingness and taking firm, effective measures against all those who try to cause damage to our socialist construction and to harm public and personal property, against parasitical elements, speculators and all those who, by their deeds, try to taint the civil, healthy climate of our society.

For this purpose we consider that it is necessary that the organs of the public prosecutor's office and the justice organs manifest, in all cases, more effectiveness in the judgement and firm punishment of those who violate the law, thus contributing to the strengthening of a climate of socialist legality and to the prevention of new infractions.

Also in our own activity we will not permit, in any form, the taking of abusive measures, which our party and you, personally, have criticized repeatedly. In our entire activity, we will manifest high party principledness and a spirit of vigilance; we will unceasingly develop criticism and self-criticism in regard to defects; we will constantly promote the most appropriate work methods and forms for each stage; we will work for the perfecting of political and specialized training of cadres, for the strengthening of educational work in the ranks of all personnel.

Under the leadership of the party organs, we will rely continually, in the execution of our mission, on the support of the collectives of workers; we will improve cooperation with the organs of the public prosecutor and the justice organs, with the other state and public organs, together with whom we will make an increased contribution to the education of citizens in the spirit of observance of the laws; we will work for the continued reduction of the number of infractions and for public discussion of those who commit penal acts, thus creating a strong current of public opinion in regard to every violation of the norms of living together in society. We will take firm measures to combat the unjust attitude of some militia cadres who sometimes tolerate the committing of infractions and do not take a stand against those persons who, utilizing the positions which they hold in local organs, try to shirk their responsibilities under the law and commit various abuses.

The organs of the Ministry of the Interior and the militia organs should have a principled and firm attitude in all circumstances; they should not accept intercedings under any form, regardless of their source; they should apply the law without letting themselves be influenced by the position of the person who has violated it, thus executing their duty to use the party and the people.

Under conditions when the role of the peoples councils is increasing greatly, we will intensify our efforts to contribute, to a greater extent and with increased efficiency, to the implementation of the tasks which the party and you have placed before us. We have in mind both a more constant mobilization of Ministry of Interior cadres who are deputies in the peoples councils, to execute, in the best possible conditions, the mandate entrusted to them, and the more active participation of all our organs in the solution of the many problems confronting the peoples councils.

Giving special attention to elevating our entire activity to a qualitatively superior level, we will fight for the implementation of the party policy on strengthening the defense capability of the country, under conditions of the application of the recent decision of the party leadership on the reduction of military expenditures and we will make an increased contribution to the defense of the national sovereignty and independence of the country.

We assure you, beloved and esteemed comrade supreme commander, that we wo will spare no efforts in firmly carrying out your guidelines and directives, which are of overwhelming theoretical and practical significance, in regard to the ways and means by which state security, national wealth, public peace and order, and civil rights and freedoms should be defended in our socialist society.

'Blasphemers' of Classical Writers Condemned

Bucharest ROMANIA LIBERA in Romanian 13 Sep 80 p 7

[Speech by the writer Paul Anghel]

[Excerpts] Some literary historians might say that 15 years represents too short a period to be defined as a literary period, saying that a new period is connected with older periods and that it continues them and develops them. This is true but this is valid for all great periods. The books which appeared in this period [the past 15 years] could not have appeared earlier, neither so many nor so good books, and this says everything about the climate of development of literature art and culture in Romania today. In order to develop, literature--and not only literature--needs a good climate, a warm climate and the warmth which this period has brought us is the warmth of the man who beings it. There he is!

I would like to give an example in regard to the improvement of the climate in literature: the abolition of censorship. No matter how many misfortunes censorship causes, it is known that the first victim of censorship, anywhere, is the written word. But censorship oppressed not only the written word but also the thought. Comrade Nicolae Ceausescu took the initiative in getting rid of this anachronistic institution, imported from other shores and representing an era of frost. We are indebted to him for the fact that our literary works are published today as they are written, as we think them and thus they reach you, our readers more rapidly. There are many reasons why we, the writers, are grateful to the secretary general of the party and our gratitude has some obligations: we respond to a great period with a great literature.

How do we do this? This is being done, this literature exists and is being created before our eyes. It is an involved and militant literature, militating resolutely for our socialist country and for its people, proclaiming the noble humanist ideal of this new and innovative period. Our literature today is an integral part of the great construction site and creation site which is Romania. Here is another characteristic: today's literature has taken over in a felicitous way the great and glorious tradition of the golden ages of Romanian literature. The painful break with the past, a grievous break which lasted for a number of black and cold years, has been eliminated in a determined manner. Today, the great classic writers are our contemporaries; they are no longer foreigners in their own country.

The greatest writers--Eminescu, Sadoveanu, Arghezi, Blaga and Calinescu--will help us by their example to make a new classical period of Romanian literature, which we desire, a period of universal reference. It is not possible, we are convinced for present-day Romanian literature not to reflect the fate of Romania today. At the same time, we have a literature which is receptive to the new and open to the newness of literary techniques and procedures which come from contemporary life, from the language and sensitivity of contemporary man, from the thought and philosophy of the builders of socialism.

This is why we are troubled by some radio stations, not in our country but elsewhere. Some gentlemen somewhere else are teaching us how to write Romanian and how to feel human while they have turned their backs on the language and the feeling of this land. Let us say that they do not like today's writers because they are Communists and because they write a committed literature, but they are also blaspheming our classic writers--Sadoveanu, Arghezi and Calinescu--who have no other vice, they and the others of bearing Romanian literature on their shoulders, as on the shoulders of giants. These professional blasphemers reject, not only the literature of today but also every Romanian value. They do not like it when we write about the freeholders of Stefan the Great, or when we write about the heroes of Plevna, or when we write about the men of today, so that you might ask them: Gentlemen, don't you like the Romanian people at all? According to them, it would have been well if this people had left the country, going, young and old, to some other place and reintegrated themselves with the Martians, if possible, leaving an empty space here.

Our essential task remains that of elevating the country to new stages of progress and of raising to a state of magnificence the culture, science, art and literature of today's Romania. Who will do this if not us, we who are here on this land? As for literature, we still have a lot to do to raise it to a new level. Justifiably, here in the Congress, criticism has been addressed to weak creations, unsatisfactory both ideologically and artistically, and, justifiably the desire has been expressed that works of art and culture should express the truth of our age more resolutely and more vigorously. But, to tell the truth, we expect much more severe criticism. In this regard, it seems to me that we should accentuate the militant content of literature, the involvement of literature in the great themes of the times, in the problems of life and the building of socialism in today's Romania. This is my opinion; there may be other opinions, but I am asserting my option, my literary belief. It seems to me that we should increase the altitude of meditation in our books, the quality of ideological and artistic thought, a thought which comes from a new, scientific and humanistic ideology--the ideology of the party. We must increase our contacts with the life of the builders of socialism. Let us go more frequently and stay longer in the places which we left since life is the only reason for a work of art. How else can we confront the future than by relying strongly on the past and the present?

Role of Trade Unions Discussed

Bucharest ROMANIA LIBERA in Romanian 13 Sep 80 p 6

[Speech by Emil Bobu, chairman of the Central Council of the General Union of Trade Unions of Romania, minister of labor]

[Excerpts] In the system of socialist democracy, the development and perfecting of worker democracy finds profound expression today in worker self-management which has, in the new economic-financial mechanism and in the self-administration of enterprises, a broad and fertile field for action and for the manifestation of the new status of the working man--that of owner, producer and beneficiary of the entire national wealth. In this orginal, profoundly democratic system of worker self-management, the trade unions are not merely involved and do not merely make contributions. They are direct participants, with precise and concrete responsibilities, rights and duties.

I would like, from this high forum of our socialist democracy, to express the satisfaction and gratitude of the trade unions for the conditions which have been created for them to assert themselves as mass organizations of the working class and of workers.

Taking into consideration and the increasing role, importance and attributes of the trade unions, we place at the center of their activity the mobilization and uniting of the efforts of all owrkers for the exemplary implementation of the socio-economic development plans of the country on which the uninterrupted progress of the country and the improvement of the well-being of the workers depend.

Acting together with the masses of workers, in the name of the interests of the working class and of workers, the trade unions never forget for a moment that powerful axiomatic statement of the secretary general of the party that nothing has fallen to us from the skies and that we have received nothing from others and all that has been done in our country is the fruit of the heroic and self-sacrificing work of the working class and of the entire people and that only by determined, disciplined work can we achieve what we aspire to--an ever-more prosperous life, an ever-higher prestige in the ranks of the countries and peoples of the world.

We are aware that the trade unions must do much more so that each worker will understand the significance of the status of the working class as owner, producer and beneficiary of the entire national wealth. We must work so that this is affirmed in work deeds, in the framework of worker self-management and economic self-administration in the enterprises, in the way the work collectives manage the part of the national wealth entrusted to them, as well as the technical assets, material resources and labor force of the enterprises.

We must do more to achieve a wise utilization of the labor force, to increase the professional skills of the workers and to reduce the number of non-productive, auxiliary, bureaucratic personnel. We must act more perseverently to mobilize all workers to assure in all units a strict system of savings and of the most judicious use of raw materials, other materials, energy and fuel, for the collection, recovery and recycling of everything possible in the production process.

In our political and educational work, we must act with more determination to combat any negative manifestations, retrogade mentalities, and attitudes in contradiction with the principles of socialist ethics and equity, with the norms established for living in our society.

We will intensify our control over the implementation of labor safety, for the reduction and elimination of work accidents and occupational illnesses, for the improvement of the quality of health care in the enterprises and the development of the networks of canteens and snack bars.

Assignment of New Workers Cited

Bucharest ROMANIA LIBERA in Romanian 13 Sep 80 p 6

[Speech by Sara Santa, deputy chairman of the Covasna County People's Council]

[Exerpts] I would like to refer to the problem of the assignment and hiring of the labor force, especially those workers with higher training. In my opinion, there should be more firmness in the application of the law regarding the obligation of graduates to go where the interests of society require. It is true that the peoples councils have an important role in creating the material conditions which these young people need to become integrated in their work. But we cannot approve of the system of intercessions, of so-called "negations", with negative results for the cadre situation in each county since specialists from the provinces are able to take the road to the Capital too easily.

Minister Cites Health Problems

Bucharest ROMANIA LIBERA in Romanian 13 Sep 80 p 6

[Speech of minister of health Eugen Proca]

[Excerpts] We cannot overlook the fact that there are still some shortcomings in the activity of workers in the health field. Neglecting the methodological role, the role of technical assistance and support in carrying out far-reaching prophylactic actions and monitoring their application, they have not given adequate attention to chronic diseases. The national program for recovery--a valuable work instrument in this important sphere of present-day medicine--was late in being finalized. Although during recent years there has been a continual increase in the consumption of medicines in Romania and

although their production has been diversified, the regular supplying of the entire range of varieties has experienced fluctuations and deficiencies have been noted in the quality of some medicines. No organized framework has been created for the utilization of medicinal plants, an inexhaustible source of therapeutic elements, a resource of great importance for providing the raw materials which are solicited more and more by the chemical and pharmaceutical industry; the unscientific utilization, without a methodological framework, of the natural curative factors, an inestimable wealth of our country, is another deficiency in this area.

Scientific research, an important field of work of the doctor, has not yet obtained results capable of eliminating out-model methodology, routine and conservativism, despite the fact that it has at its disposal an excellent material base and well-trained cadres, many of them prestigious personalities.

Also, all efforts have not been exerted in support of the allocation, on a priority basis, of apartments from the state supply to families with a number of children and the strict observance of the legislation governing the work of pregnant women has not been monitored closely. I can only be in agreement with some provisions provided by the proposed modifications of laws No. 4 and No. 5 of 1973 in regard to the granting of preference to families with a number of children or with difficult living conditions.

Despite the fact that the Ministry of Health, on the basis of the tasks set by the plenum of the Central Committee of our party, together with other ministries, has organized actions for the improvement of living and working conditions at all levels, no better organized actions have been undertaken which would lead to the elimination of chemical and physical pollutants and which would require the observance of antipollutant legislation. Also, departures from the norms of medical ethics and deontology are still being noted on the part of some health personnel; there are doctors who, ignoring the humanism of the profession, show evidence of superficiality, do not behave in a civilized manner in their relations with patients, perform their medical services on a mercantile basis, and are absent, unjustifiably, from their work place.

The Ministry of Health and the peoples councils are called upon to apply and to support the implementation of complex measures aiming at the protection of pregnant women, the assurance of conditions of complete safety for the birth process, and the active monitoring of the newborn baby, the infant, and the child, on an individual basis. Factors of special importance in preventing and combating illnesses are the assurance of suitable hygiene conditions in all sectors of activity and the perfecting of the medical care which is given in workers' collectives.

A matter which is also important for health is proper nutrition for the people, an area in which the health organs and the peoples councils have well-determined functions.

'Significant Shortfalls' in Agriculture

Bucharest ROMANIA LIBERA in Romanian 12 Sep 80 p 5

[Speech by Angelo Miculescu, deputy prime minister of the government, minister of agriculture and the food industry]

[Excerpts] In agriculture, the tasks of the plan were not achieved year after year, resulting in significant shortfalls in the five-year plan which is concluding. This has had a negative influence on the development of agriculture, the achievement of programs for the economy as a whole, especially export and the balance of payments. Also, we must say openly that our results have not been up to the level of the technical-material base, of the financial means, and, in general, of the assistance given by the state.

The shortfalls in vegetable production, especially in the production of grains and fodder crops, have had a negative influence on the development of animal production which, in turn, has created significant difficulties in satisfying all the needs for raw materials for the food industry and light industry.

These results show that in the activity of the Ministry of Agriculture and the Food Industry, the peoples councils, the agricultural organs, and the leaderships of many production units, significant deficiencies continue to be manifested in the use of land, in the use of means of mechanization and chemicalization, in the execution of land improvement works, in achieving the numbers and yields of animals, in the mobilization and organization of the labor force, which results, in many units, in the failure to execute in time and with proper quality the works determined by technical norms and, as a direct result, poor products, below the level of possibilities and with unfavorable economic and financial consequences, are still being obtained.

In the next five-year plan, we must do our best to obtain a yield of 27-28 million tons of grain and this objective is at the basis of the increase of animal production to 45-46 percent of the total agricultural production. The providing of fodder, the exploitation, with increased yields, of the more than 5 million hectares of pastures and arable land intended for fodder production, constitute, as Comrade Nicolae Ceausescu has said, central tasks for zootechny, and all necessary measures should be taken for their achievememt.

Shortcomings of Trade Network

Bucharest ROMANIA LIBERA in Romanian 12 Sep 80 p 2

[Speech by Ana Muresan, minister of domestic trade]

[Excerpts] Viewing our work self-critically, I must acknowledge that although we have had positive results, shortcomings still persist in trade

activity. The Ministry of Domestic Trade and the local trade organs have not monitored with sufficient attention the appropriate distribution of goods on a territorial basis and this has created certain deficiencies in supplying some localities. We have not acted with the necessary firmness to make some suppliers and producing ministries, which are in arrears month after month, respect their contract obligations, in the framework of the state plan. At the same time, in some trade enterprises, there is no continuing concern for the management of the units and the supply of goods.

The inadequate use of commercial space, the unjustified placing and spacing of some units and markets in some sectors and localities have had negative effects on the level of supplying. Also a climate of order and discipline and of responsibility and respect for the customers has not been created in all the units.

Housing Problems in Foscani

Bucharest ROMANIA LIBERA in Romanian 12 Sep 80 p 3

[Speech by Alexandrina Mocanu, chairman of the Foscani Municipality People's Council]

[Excerpts] Despite the efforts made by the state to resolve the housing situation for the people, there are still some citizens whose housing problem has not been resolved. Of course, this is a result, partially, of shortcomings in construction activity. But, in my opinion, housing legislation should be improved, especially in regard to the distribution of housing space. I would propose that the law provide more equitable criteria for determining the housing space for landlords and that those rooms in excess of the housing needs of the landlord and his family be rented by the landlord and by the people's council. Also, the peoples councils should be obligated by law to check periodically, possibly every quarter, on the situation of excessive housing space.

Shortcomings of Young Workers

Bucharest ROMANIA LIBERA in Romanian 12 Sep 80 p 2

[Speech by Pantelimon Gavanescu, first secretary of the Central Committee of the Union of Communist Youth, minister for youth problems]

[Excerpts] The activity of the Central Committee of the Union of Communist Youth and of our organizations has had some shortcomings. In many economic units, especially in those in which the majority of workers are young, there are young people who do not fulfill the tasks of the plan, who violate production discipline, who turn out poor quality products, and who show a lack of interest in the activity of the respective enterprises. We must act systematically to generalize the progressive characteristics of the new type of man, to increase combativity toward tendencies and manifestations of careerism.

Distress at Departure of German Minority

Bucharest ROMANIA LIBERA in Romanian 12 Sep 80 p 4

[Speech by Iosif Eckenreiter, first deputy chairman of the Sibiu County People's Council]

[Excerpts] In our country, all nationalities, Romanians, Germans, and Hungarians, benefit from complete equality in the right to a constantly better and more prosperous life. Therefore, I am overwhelmed with indignation when some citizens of German nationality, apathetic in regard to the country in which they and their ancestors were born and raised, in regard to the excellent prospects for asserting themselves which it offers, leave their country, blinded by an illusion of achievement abroad.

With all my heart, I express here my disapproval of such actions and my disgust with the lies circulated against our country by the various radio "voices" of the renegades. Let them leave us in peace!

It is the duty of all of us, the deputies, to intensify our work of patriotic education among the masses of citizens and to demonstrate to those who want to leave the country the adventurist path on which they are embarking.

We are aware of the obligations of the peoples councils in regard to the adoption of proper measures for the knowledge and strict application of the party decisions and the laws of the state by all citizens, the strengthening of public order and discipline, the protection of public property, order and the goods of citizens. I consider, in this area, that the local organs of the militia and the other organs which carry on their activity in this area have the duty of giving the peoples councils reports on the way in which they perform their functions assigned by law. In particular, I would like to stress the fact that much more firmness should be shown in regard to the observance of the laws in the construction sites, where materials, energy, and fuel are not used with sufficient thrift.

Benefits for Miners Cited

Bucharest ROMANIA LIBERA in Romanian 12 Sep 80 p 2

[Speech of Petre Barb, chairman of the People's council of Petrosani Municipality, Hunedoara County]

[Excerpts] On the basis of your guidelines and directives, given at the time of your visits to the Jiu Valley, the economy of Petrosani Municipality is experiencing an intense process of development and diversification. We are giving priority attention to the fulfillment of the plan for coal production. However, I must say that we are not satisfied with the activity carried out and the results obtained because some mining enterprises have not fulfilled the tasks of the plan. This is why we are concerned with

raising the spirit of worker combativity in all work collectives and orienting attention more firmly in the direction of the better use of working cadres and equipment, the improvement of the organization of labor and the strengthening of order and discipline, so that we will make the activity of making up for lost time and the achievement of the plan in coal production a concern both for the miners and for all those who work in the Jiu Valley. In this effort, we would like to receive more active assistance from the responsible ministries, especially in regard to the program for the mechanization of the extration process and the ensuring of the work front for 1981, an area in which we are still lagging.

The miners of the Jiu Valley are deeply grateful to you, most esteemed Comrade Nicolae Ceausescu, for the program of the construction of industrial units needed for the employment of the female labor force. The "vis "viscoza" enterprise in Lupeni has been expanded and the silk mill is near completion. The Vulcan clothing factory, the knitwear enterprise in Petrosani and the Petrila furniture factory have begun production. More than 5,000 women will work in all these units, the majority of them, wives and daughters of miners.

To all this we add, with gratitude, the substantial increase in the monetary incomes of the workers--the miners were the first to benefit from the increase in wages--, the increase in the consumption of food, industrial products and products of general use and the improvement of the level of comfort.

However, we must state that we are not succeeding in raising the level of the peoples councils activity up to the level of the great current demands, in all places. The shortcomings which still exist in the activity of some peoples councils oblige us to persevere so that it will be understood that the peoples councils must act in the present period in a new, revolutionary spirit and must ensure, unceasingly, the promotion of the principles of socialism, the building of a new order in the territorial-administrative units in which they operate. On the basis of these demands, I believe that we should analyze whether the name of the peoples councils should be changed, perhaps to "revolutionary peoples councils" or "socialist peoples councils", so that they will better respond, by their name, to their mission as organs of the revolutionary power of the people and of our socialist order.

I read with interest the provisions of the law in regard to the increasing of the responsibility of local organs in the revolutionary, patriotic education of the population, in the formation of the socialist awareness. I must say, self-critically, that we are not succeeding in carrying out a continuing cultural-educational activity everywhere, in combating negative states, in cultivating, in all citizens, love of work, respect for the law and for the principles of socialist ethics and equity. Also, I believe that the central institutions of education, especially, television, the films, and the central press, should give us better support in this work.

One cannot speak of support on the part of some television broadcasts which flood the television screens with all sorts of poor-quality Western films, which, instead of criticizing capitalist realities, present an apology for the bourgeois way of life. I also believe that the Council for Socialist Culture and Education should assist us by sending us many more good films and sending many more theater groups to the Jiu Valley, groups with a militant, educational and revolutionary repertoire.

Harmful Television Programs Scored

Bucharest ROMANIA LIBERA in Romanian 12 Sep 80 p 2

[Speech by Nicolae Gonea, first deputy chairman of the Bucharest Municipality Peoples Council]

[Excerpts] We are aware that our results would have been better if there had not been a number shortcomings in the work of the local organs of state power and administration. For example, we have had delays in the implementation of the program for the construction of housing; lags have occurred in the areas of providing services and utilizing local resources; the services do not respond to the needs of the population, both in regard to their range and their territorial distribution. There are shortcomings in the activity of supplying the population, especially in the judicious distribution of the existing supply of goods, as well as in the manner of serving the consumers. In regard to public transportation, we must say that there are still a number of deficiencies in providing transportation at regular intervals in peak hours, repairing and maintaining the vehicles, and the observance of rules of order and discipline by all the personnel of the Bucharest Transportation Enterprise.

Some shortcomings continue to exist in the work style and methods of the people's councils of Bucharest and its sectors. One often finds manifestations of formalism, conservativism and bureaucracy, and lack of concern, in some cases, for the needs of the population.

The deficiencies existing in the activity of the peoples councils are a result of the fact that, sometimes, their staff must concern itself with the compilation of numerous statistics and situation reports, covering a multitude of data requested by the Committee for People's Councils Problems and other central organs dealing with planning and synthesis, to the detriment of the everyday, concrete work amoung the citizens.

I acknowledge the fact that we are insufficiently concerned with education and with the management of the material base intended for this activity and with the organization of extensive cultural-artistic and sports manifestations and I must say that the peoples councils have registered a number of complaints from citizens in regard to the programs broadcast on radio and television. I agree with the criticism of Comrade Petre Barb in regard to

some television programs. Uninteresting, unconvincing programs, with no connection to actual life, are broadcast and too many Western films, without any educational message and with harmful influence on the youth, are scheduled.

The peoples councils and the militia, the public prosecutor, and the justice organs must increase their attention to any deviation from the laws of the country. We do not understand why some state organs have become meek and tolerant toward those who violate the law. cmmmit anti-social acts and strike at public or personal property. We must act determinedly against all manifestations of hooliganism, of theft, of uncivilized behavior, for the strict observance of the principles of socialist ethics and equity by all citizens.

Dialogue with Citizens

Bucharest ROMANIA LIBERA in Romanian 13 Sep 80 p 7

[Speech by Victor Bordea, chairman of the Tirgoviste Municipality People's Cpuncil]

[Excerpts] First of all, in my capacity as deputy of the Dimbovita County People's Council and as mayor of Tirgoviste Municipality, please allow me to present to the leadership of the party and the state and to you, personally, most esteemed comrade Nicolae Ceausescu, the thanks of the workers of these ancient Romanian regions for the invaluable support given to the rapid development of Dimbovita County and Tirgoviste Municipality.

The procession of the many founders of the city, which was interrupted centuries ago, has been resumed in recent years with the most brilliant and visionary of them all, the most important man in our history, Comrade Nicolae Ceausescu, to whom all workers are grateful and will always be grateful in their thoughts, hearts, and deeds.

In the most glorious period in the history of our country, initiated by the 9th Congress of the Romanian Communist Party, the city of Tirgoviste, like all the localities of the country, is undergoing a powerful socio-economic emancipation. During this period, industrial production has increased from one billion to more than 12 billion lei and the population on the municipality has increased more than 3 times. More than 18,000 apartments have been constructed and are inhabited by 3/4 of the residents of our muncipality. During the last five-year plan alone, the average annual rate of industrial development has exceeded 23 percent, which will permit Tirgoviste to become a large industrial center of the country.

The speaker referred to the activity of the people's council and of the deputies for the good management of the city, for the revolutionary education of all citizens for the best possible organization of the "Hymn to Romania" national festival.

Therefore, in order to assure that such manifestations and political-educational activities, in general, are carried out under the best possible conditions, I believe that the cultural attirbutes of the peoples councils should be better defined in the amendments which are being proposed for the Law on the Organization and Operation of the Peoples Councils, so that their adoption will lead to an increased role for the local organs of state power in the formation of the new man and of his revolutionary awareness.

We are aware that a number of deficiencies persist in our activity. They were known, even more courageously, in the systematic meetings which we have had with citizens in the framework of the forum of civic dialogue called the "Tribune of Democracy", an initiative for which we are indebted to the secretary general of the party and to his undiminishing concern that every person in this country should have his say in regard to the solution of all problems related to movement on the road to multilateral economic and social progress. We are determined to improve our work style, making each action which we undertake a daily concern for all citizens, involving our entire activ, headed by the Communists, in their mobilization. We will concern ourselves more thorougly with assuring an adequate material base for the regular fulfillment of the tasks of the plan by all the enterprises; we will make an effort to improve conditions in regard to public transportation, water supplies, and the creation of acceptable conditions for all. Some needs can be better satisfied, in our opinion and as the dialogue with the citizens revealed, if the responsible organs will carefully analyze the proposals, which I am making it my duty to formulate, in the framework of our forum. In light of the fact that the Doicesti thermoelectric power plant is only 10 km. from Tirgoviste Municipality, we ask the Ministry of Electric Power to accelerate the necessary work so that arrangements can be made for receiving thermal energy from this source; in order to provide the highly-skilled manpower needed for the industrial units in the municipality and in Dimbovita County, I propose that an analysis be made of the possibility of establishing a branch of Bucharest Polytechnical Institute--an evening course--in Tirgoviste, to train subengineers in the branches of metallurgy and machine building.

CSO: 2700

REGULATIONS ON DISCARDING OF MILITARY EQUIPMENT

Bucharest BULETINUL OFICIAL in Romanian Part I No 69, 8 Sep 80 p 1

[Council of State Decree Amending Article 50 of Council of State Decree No 207/1976 on the Material Responsibility of Military Personnel]

[Text] The Council of State of the Socialist Republic of Romania decrees: Sole article -- Article 50 of Council of State Decree No 207/1976 on the material responsibility of military personnel is amended and will have the following content:

"Art. 50 -- (1) The declaring obsolete and discarding of material goods, including military hardware belonging to the armed forces, are executed as follows:

a) with the approval of the Defense Council of the Socialist Republic of Romania for military hardware stipulated in the annex *) to the present decree;

b) with the approval of organs of the Ministry of National Defense and of the Ministry of the Interior, respectively, according to the areas of jurisdiction stipulated by the Defense Council of the Socialist Republic of Romania, for material goods and military hardware other than that provided for in the annex.

(2) Material goods can be discarded only if they have been in service for the length of time stipulated by the law or if they are in an advanced stage of wear and are not able to be used for any other purpose in the national economy and cannot be repaired or modernized.

The material goods which are discarded will be taken apart, ensuring that the units, sub-units, components and materials can be recovered so that they can be recycled into new articles or used as spare parts or for repair work, in the state in which they are obtained or through reconditioning, for the needs of the armed forces or for the national economy.

*) The annex is being transmitted to the institutions concerned.

The other materials obtained by the discarding of material goods can be retained by the units which have discarded them, for the satisfaction of their own needs or to distribute to other military units and to be utilized, according to the law, in the socialist sector.

(3) The minister of national defense and the minister of the interior, respectively, on the basis of the decisions of the management councils, will issue, with the approval of the State Planning Committee and the Ministry of Finance, norms regarding the removal from the records of material goods used up or worn out in the process of combat training or in other activities, regarding the process of declaring obsolete and discarding material goods belonging to them, including military hardware, regarding the subtracting of losses from rejects as well as the subtractions in percent for the losses resulting from their perishability or their transformation."

HEROIC EFFORTS OF FIREFIGHTERS HAILED BY COMMANDER

Bucharest SCINTEIA in Romanian 13 Sep 80 p 8

[Article by Major General Gheorghe Bricaeg, commander of the firefighters; "Firefighters' Day--Carefully Watching Over the Property of All"]

[Excerpts] It has been a tradition of our people to celebrate the "Day of the Firefighters of the Socialist Republic of Romania" each year on 13 September. This is an occasion to remember the heroic struggles carried on by the detachment of Bucharest firefighters in the battle of Dealul Spirii, on 13 September 1948, against the Ottoman invaders, for the defense of the ancestral land and for the cause of the revolution. It is also an opportunity to express appreciation to those who today protect from fire the national wealth, the lives and the property of citizens.

The unprecedented socio-economic development during the years of socialism, the increase in national property from year to year, in the number and importance of industrial and agricultural units, their equipping with high complexity machines and installations, on the level of world technology and the diversification of manufacturing techniques have necessitated and still necessitate special attention to combatting and, especially, to preventing fires.

Thoroughly trained, ready at any moment and under any conditions to resolutely face dangerous situations, the firefighters have taken action, whenever necessary, with a high spirit of patriotic self-sacrifice and professional competence, putting out fires and saving important material assets from destruction. Military members of firefighter units in Turceni, Tirgu Jiu, companies I and II in Ploiesti, in Bacau, Tirgoviste, Orastie and others have demonstrated real courage and bravery and, when necessary, heroism in their actions.

Stressing the activity of prevention, special attention is being given to the technical examinations executed by the representatives of the firefighter units in all economic and socio-cultural installations, especially in those with a high level of vulnerability to fire.

With a view to fire protection, an intense and diverse educational activity has been organized and carried out among the masses. Also, closer collaboration has been achieved with specialists from the economic ministries and the central institutions and with members of the technical commissions in the installations and localities in eliminating the causes of fires. However, in some economic and socio-cultural units, one still finds aspects of negligence or imprudence, the ignoring of technical norms for the utilization or maintenance of aggregates and installations, with the resulting risks.

Members of technical commissions and of civilian firefighters' groups make an important contribution to carrying out a continued and effective activity of preventing or putting out fires. Outstanding among these are the technical commissions in the chemical combine of Craiova, the Teleajean petrochemical combine, the Blaj wood processing plant, the Galati iron and steel mill, the Constanta naval shipyard and others as well as the civilian firefighters' groups in the localities of Buhusi, Saveni, Cruset, Calatele, Masloc, Hida and Cisnadioara--which were rated in first place in the patriotic competition organized in this area.

As a result of the raising of the level of awareness and of the spirit of responsibility of workers, there have been frequent cases in which citizens have intervened directly or have promptly notified the firefighter organs for the purpose of eliminating situations or irregularities which might cause fires. But the most valuable assistance which the firefighters can receive from the population is the observance by all citizens of the norms of fire prevention, thus eliminating the causes which produce fires.

While they are proud of their successes, the military and civilian firefighters are also aware of the shortcomings in their activity and the fact that the quality of their actions has not always been up to the level of the conditions created. They will do their best to continue to improve their readiness.

THEATER SEASON RECEIVES CRITICAL REVIEW

Bucharest CONTEMPORANUL in Romanian 6 Jun 80 p 7

[Article by Valentin Silvestru: "Meditation in a Loud Voice--Which Could Be Wrong"]

[Text] How does the theatrical season look? Can it be portrayed, does it have distinctive features? It is difficult to reply. Any illuminating comment on this subject also has its negative counterpart. The picture is contradictory. We are experiencing the most fertile moment of original dramaturgy, not only in the sense that we have significant works of all kinds and genres, many of which have been printed or staged, but also in the sense that performances of Romanian tragedies and comedies have a noteworthy artistic value and are enjoying the real appreciation of the public, the support of the critics, and the interest of other opinion leaders. Horia Lovinescu's admirable modern parable, 10 years old, has been staged and awarded the imposing Theatrical Criticism Prize. Nearly all of Teodor Mazilu's comedies are appearing on several stages to the great and lasting satisfaction of the public. Marin Sorescu is seeing a play performed that he wrote a decade ago, and he has the pleasure of seeing his historical writings in new settings that are winning awards at festivals. Two interesting plays by Fanus Neagu are being staged. Tudor Popescu, an author who has come to prominence more recently, has been welcomed by many theaters. The novelist Mircea Sandulescu, a highly deserving beginner, is appearing over the footlights with two dramas at almost the same time. Aurel Baranga's incisive comedies are receiving new and successful stagings. A successful social drama by Paul Everac is being replayed by more and more theatrical companies. Andras Suto is on the billboards of several theaters, with the original versions and translations of five of his plays. On the other hand, I do not know why a monumental historical chronicle by Dumitru Radu Popescu, although published, has been awaiting its interpretation for a rather long time. Dumitru Solomon's comedies of ancient paraphrase, which are admirable modern allegories, have not reached the stages of Bucharest for years on end. Ion Baiesu's plays (some not yet performed) have been almost entirely forgotten by the theaters. Paul Cornel Chitic's documentary dramas of original design have figured in repertory plans for years and have

been praised by all (with the sole exception of those who promised long ago that they would stage them because they are good but who now say that they have not staged them for many years because they are not good). And in the meantime minor, dull and faulty works of so-called local authors are being produced, authors who have had two or three failures and whose lack of qualification and talent is apparent to all those who labor with their substandard output. Frivolous dramas and pointless farces, domestic and foreign, are preferred, swelling the wave of mediocrity that is provincializing our theater and divorcing it from problems and culture.

The same author, Tudor Popescu, is offering the theaters a forceful satirical comedy entitled "Occasional Paradise" /Paradis de ocazie/ and has published (in TEATRUL) an excellent, wonderfully well written drama entitled "We Are Not All Born At the Same Age," but he has also published an insipid farce of the boulevardier variety entitled "The Sweet Hypocrisy of the Mature Male," and of course various entrepreneurs with doubtful taste are flocking to it. The Little Theater is rising to the top of the theatrical movement with the most important play of the season and a performance of great scope entitled "The Fortuitous Middle Ages" /Evul mediu intimplator/ by Romulus Guga, and then it produces in its annex, The Very Little Theater, minor writings and a trivial melodrama or rather a series of monologues, produced with inexplicable eccentricities and essentially false, entitled "Kennedy's Children." The same stage manager, Liviu Ciulei, an artist of the highest caliber, creates the memorable performance "The Storm" and then signs the poor adaptation of a deplorable American trifle called "Gin Rummy." The same young actors who so often delighted us at Piatra-Neamt now appear in a vague, unrecognizable way in a stultified and sterile production of "The Stormy Night." The list of vexations could be prolonged.

It could not be said that there is no trend of opinion critical of anomalies (although the anticritical pressure is not insignificant either) or that true achievements are not encouraged. Every month there is an extensive demonstration of theatrical culture (this year at Craiova, Pitesti, Brasov, Sfint Gheorghe, Birlad, Vaslui etc.), as well as festivals and colloquiums favoring fertile, democratic discussions with very lively exchanges of experience and opinions that are continued in the press. There are also constructive discussions of each theater's activity, either in the country or, when there are tours, at the headquarters of the Artists' Association, on the initiative and with the generous support of the Dramatic Criticism Section, as well as symposiums, meetings among collectives, scientific meetings, and conferences, all with a beneficial effect upon consideration and determination of theatrical policy. Then why these uncertainties and contradictions and so many inconsistencies? Again it is difficult to frame replies. Nevertheless: Some plead publicly for a current, political, committed, militant and aggressive repertoire but choose (sometimes the same people) plays which will be "purely entertaining," pointless and "without problems," "spirited dramas" and "comedies without satire" which "will not cause headaches" and "will bring money to the box office no matter how," although it has been seen how Shakespeare, Duerrenmatt, Pirandello, Caragiale, Baranga, Sorescu and Mazilu can bring people to the box office in droves, and not in any fashion but with true, dramatic and inspiring

literature, brimming with ideas and, coming from some of our authors, timely and with a high political and patriotic value.

Then there is also the disastrous practice of throwing performances together without skill, thought or consideration. In some places this is not considered artistic work but a kind of rough carpentry. The stage management and sometimes even the scenography are entrusted to authors who are estimable as such but not as producers. The bookkeeping or planning would not be entrusted to them on any account, or any other prerogative of the theater, but they can perform stage management as mere dilettantes among professionals. The directors, actors and literary secretaries also perform it. A performance with the stage management signed (on placards) by the congenial Constanta comics Jean Constantin and Gelu Manolache is traveling through the country! Another one bears the stage manager's signature of the director of the respective theater and a newspaper man. Performances are very hurriedly arranged in 2 or 3 weeks. Comrade Mihai Berechet, who has been working for several months to put on a performance of Cocteau at the National Theater, set the record of spending only 15 days in Timisoara for Robert Thomas' "Eight Women." The stage manager Radu Sorin Grigorescu of TV roves through the country proposing showings of 3 days and one night, during which time the performance is recorded on film and an "outlet at a station" is promised him (which sometimes even happens). Special performances are held "for villages" and "outside the plan" "which the critics will not see or know of."

Such harmful phenomena, the infiltration of fraudulent, antiliterate translators who buy up foreign trifles quickly and cheaply, the pressure of provincial and Bucharest scribblers upon the theaters, the absence of scientific documentation, the inclination toward easy successes, indifference and sometimes repulsive and authoritarian hostility to criticism (regarded de plano as malicious, interested, erroneous etc.) and the like serve to restrict the sphere of influence of the dramatic theater. Our creative potential is extraordinary in all sectors. It is now only partially in use. Meanwhile the great achievements are not the rule in this season.

BRIEFS

EARTHQUAKE IN GALATI--The Center for Earth Physics and Seismology announces that on 12 September 1980, at 0224 hours, 25 seconds, there was an earthquake with a magnitude of 4.7 on the Richter scale in the vicinity of the city of Galati, at a depty of about 15 km. The intensity of the earthquake at its epicenter was 5 degrees on the Mercalli scale. The earthquake was felt in Galati, Braila, Macin, Tulcea, Focsani, Rimnicu Sarat, Tecuci, Bacau and Birlad, with an intensity of from II to IV degrees. There was no material damage. [Text] [Bucharest SCINTEIA in Romanian 13 Sep 80 p 8]

LIBYAN ANNIVERSARY RECEPTION--On the occasion of the 11th anniversary of the 1 September revolution, Libya's national anniversary, that country's ambassador to Bucharest gave a reception on 4 September at the Intercontinental Hotel. The reception was attended by Virgil Trofin, deputy prime minister and minister of mines, petroleum and geology; Gheorghe Caranfil and Dumitru Popa, ministers; Dumitru Bejan, minister secretary of state at the Ministry of Foreign Trade and International Economic Cooperation; Gheorghe Dolgu, deputy minister of foreign affairs, members of the leadership of other ministries and central institutions, men of culture and art, journalists, and heads of diplomatic missions and members of the diplomatic corps. [AU091344 Bucharest SCINTEIA in Romanian 5 Sep 80 p 5]

ALBA IULIA BISHOP--The President of the Socialist Republic of Romania decrees that Auxiliary Bishop Jakab Antal is recognized in the position of bishop of the Roman Catholic Diocese of Alba Iulia. [Excerpts] [Bucharest BULETINUL OFICIAL in Romanian Part I No 69, 8 Sep 80 p 2]

ORTHODOX CHURCH OFFICIALS--The President of the Socialist Republic of Romania decrees that Bishop-Vicar Simion Florea is recognized in the position of bishop-vicar of the Archdiocese of Sibiu, a position to which he was elected by the Synod of the Romanian Orthodox Church on 16 July 1980 and Archimandrite Dimitrie Coravu is recognized in the position of bishop-vicar of the Archdiocese of Craiova, a position to which he was elected by the Synod of the Romanian Orthodox Church on 16 July 1980. POLICEMEN INDICTED FOR MURDER OF BYSTANDER

[Editorial Report] Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian on 14 September 1980, pages 16-17, sheds light on the murder indictment brought against three police employees--all bearing explicity Serb names--in the beating death of a 22-year-old Moslem auto mechanic in the police station of a provincial Serbian town on 9 July 1980. The killing had not been reported in the national press until 2 weeks after the victim's funeral [see FBIS Eastern Europe Daily Report, Vol II, No 146, 28 July 1980, pp I 4-5]. Belgrade ILUSTROVANA POLITIKA in Serbo-Croatian on 29 July 1980, pages 52-53, contributes additional details. The emerging facts paint an unappealing picture of interpersonal relations in Priboj-on-the-Lim in western Serbia, where a motor vehicle factory has been turning out trucks and buses under license for more than 20 years and where the Serb population is mixed with persons retaining the Moslem identity of their kinsmen in nearby Bosnia. The case is illustrative of the range of arbitrary power in isolated communities in which an authoritarian tradition runs strong.

Given the facts of the case, Zvonko Simic in NEDELJNE INFORMATIVNE NOVINE seems justifiably surprised at an indictment for "plain murder" instead of "brutal murder," the count to be expected under Yugoslav law when the victim dies after being beaten. Two groups of people had been arguing in a cafe that July afternoon in Priboj. Unfortunately, we are not in a position to say what they were arguing about; the indictment is silent on this point. Since a drunken brawl or passing insult would presumably have been described in an indictment covering a case that had aroused much local interest, we may be justified in presuming some cause that the Yugoslav authorities would prefer not to bandy about in public, such as intolerance on ethnic, religious, or other grounds. In any event, when the arguing resumed in another cafe, someone called the police. Alija Toskic, whose names bespeak his Moslem affiliation, was among those taken to the police station, presumably as a witness. According to Desimir Milenovic, in ILUSTROVANA POLITIKA, Toskic has attempted to stop the fighting between two individuals who were ready to slug it out.

By all indications, the beating of Toskic began when he kept his hands behind his back after being told to leave them loose at his sides. Uniformed policeman Ljubisa Vukovic was first to hit him, followed by Radojko Raketic,

no policeman at all--just the station telegrapher from the next room. Uniformed policeman Dragoljub Vranic joined in with his rubber hose. All three seem to have kept hitting, kicking, and stomping Toskic until they finally realized that he was not playing possum on the floor. The indictment cites the clinical details from the autopsy: 13 serious wounds on Toskic's face, arms, legs, and back; a fatal blow to the back of the neck; contusions all over his body. According to Milenovic, Priboj medical center staffers were beside themselves when the bruised corpse was brought to them.

The most extraordinary aspect of the scene at the police station is the presence of no fewer than three civilian eyewitnesses during the beating, if the indictment is to be trusted, plus an unnamed number of uniformed policemen. Under these circumstances, Simic's rhetorical questions would seem the absolute minimum: "Why did the accused policeman Vukovic rush to beat up Toskic at the station? Why did two of his fellow-employees join in? Why did the other policemen fail to intervene to break up the melee? Above all, why did the duty officer--who had the right and obligation to do so--fail to do so?" Perhaps the hangers-on at the Priboj police station had become inured to such spectacles.

The Yugoslav authorities would like the public to believe that this was a strange instance of isolated, inexplicable abuse and that the dossier is closed.

Inexplicable it seems to be: to judge by the press accounts, petty schoolyard posturing led up to the crime. According to Toskic's girl friend in ILUSTROVANA POLITIKA, Raketic had been staring at Toskic and herself a month earlier when they were sitting on a park bench. "Why are you looking at us?" asked Alija. "Because I feel like it," Raketic answered. Five minutes later, Raketic returned with a patrolman. "Now you know who I am," he said, shoving some identity card into Toskic's face. The same Raketic is supposed to have yelled at Toskic in the police station, "So you're the one who wanted to beat me up!"

However, isolated this crime was not: 15 complaints were filed against policemen in Priboj after the tragedy occurred. A subsequent issue of ILUSTROVANA POLITIKA (19 August 1980, pages 18-19) carries a letter from ex-residents of Priboj living in Denmark who describe the head of their household as having died a few months earlier after having his nose broken by policeman Vranic. The public prosecutor, when asked about the case by relatives of the deceased, said, "My work is done. Three physicians signed that this was a heart attack and that he did not die of his injuries...I believe the physicians."

Belgrade MLADOST in Serbo-Croatian on 22 August 1980, page 6, reviews previously reported cases of police brutality, including a detail that may not have been reported heretofore: a crowd wrecked a police station in Novi Pazar, Kosovo province, in late 1979. The article does not directly link the incident with any particular case, but policeman Miljan Perovic is mentioned elsewhere in the article as having been sentenced to 20 years in prison for killing Muhamed Haljilji of Pec while the latter was fishing without a license.

VISITING SPANISH POLITICIAN COMMENTS ON BULGARIAN ANNIVERSARY

Sofia ZEMEDELSKO ZNAME in Bulgarian 4 Sep 80 p 4

[Comments by Prof Antonio Hernandez Gil, expressed to Ivan Glushkov in the offices of the newspaper, on the occasion of his visit to Bulgaria as Chairman of the Spanish National Committee on Bulgaria's 1,300th anniversary celebration]

[Text] This is my second trip to Bulgaria. I came here the first time as chief of a Spanish parliamentary delegation. Then and now I saw a people (and I was highly impressed) that is succeeding in molding together its pursuit of reform and progress with memories of and respect for its history. An appropriate proof of this is also the initiative to celebrate the 1,300th anniversary of the founding of Bulgaria. I consider this event exceptional, endowed with national and international significance, inasmuch as the contribution to its wide imprint by many other countries is concerned. Being familiar with the history of an ancient nation and having the possibility of exchanging spiritual values, is this not one of the most solid ways of consolidating friendship, of reaching the ideal that should unite humanity in its entirety, the ideal for lasting peace on our planet?

During my visit I had the honor and pleasure of meeting and having important conversations with Petur Tanchev, the secretary of the Bulgarian National Agrarian Union and first deputy chairman of the State Council of the People's Republic of Bulgaria, who was also instrumental in inviting me to this celebration. We both agreed that great possibilities exist for mutually advantageous cooperation in different fields between Spain and Bulgaria, whereby both countries will contribute to the creation of a climate of trust and understanding in Europe. Special attention was devoted to the role of the democratic parties and organizations in mobilizing public opinion on our continent to work in the name of peace and progress.

I was also received by Mrs Lyudmila Zhivkova, chairman of the Committee for Culture. We discussed three issues. The first one was the need to unite the efforts of all honest people in creating a world of peace where war will be nonexistent. We also talked about the children and the attention they

get in both our countries. I learned about the undertakings in Bulgaria connected with the International Year of the Child. I was also very highly impressed by the monument "The Banner of Peace" standing in the outskirts of Sofia. It expresses a unique and basic humanitarian idea as a concept and as an artistic creation as well.

No doubt that in the foreground of my conversation with Mrs Zhivkova was the celebration of the 1,300th anniversary of the Bulgarian nation and Spain's contribution to this celebration. I consider it a special honor and I am grateful that the responsibility of presiding on the Spanish committee for the celebration of this notable event was bestowed upon me. The committee consists of people of great authority and prestige in the fields of culture, science, and politics. We have already held several meetings and and members of the committee are eager to assist actively in the fulfillment of this noble goal.

I would like to point out that our activity will contribute to the better understanding, and hence to the creation of favorable conditions for expanding the relationship between Spain and Bulgaria. The more so as there are very clearly defined similarities between the Spanish and Bulgarian people, in character, temperament, and spirit, in spite of geographic distance. In the course of centuries our two countries have experienced critical moments but have always been able to overcome them. And I think that the important thing now is the willpower of Spain and Bulgaria to continue on the road to further progress, cooperation, and peace inspite of the daily problems facing us. It is exactly this basic goal, the celebration of peace, that should unite all people of good will. We should strive for it in spite of differences in our sociopolitical systems and philosophical ideas and probably precisely because of that.

In conclusion, I would like to use the pages of this newspaper to express my warmest feelings toward Bulgaria and the Bulgarian people, to thank you most sincerely for your heart-warming hospitality and for the opportunity to see much interesting things and to familiarize myself on the spot with the past and present of your wonderful country.

EDITORIAL CALLS FOR BETTER TRAINING OF AIR TRAFFIC CONTROLLERS

Sofia NARODNA ARKIYA in Bulgarian 4 Sep 80 p 4

[Text] The successful solution of the tasks concerning military training and further improvement of combat readiness of the aviation units in the light of party requirements and better flight safety depend greatly on the correct organization and skillful vectoring of the flights. The work of the air traffic controllers is intricate and responsible. With their alertness they keep strict order on land and in the air and react fast and correctly in difficult situations.

The air traffic controllers of the Air Force units are highly qualified and capable of achieving excellent results in fulfilling the tasks of the flight units. Officers Sinapov, Vladimirov, Todorov and many others skillfully direct flights by communicating carefully, calmly and professionally with the crew on land and in the air and constantly watching over the safety of the flights.

However, there are still some shortcomings in the training and work of some of the controllers' units where Officers Zlatkov, Slavov and some others are assigned. For example, before the start of a certain flight, Captain Totev had underestimated the difficult meteorological conditions in the area of the flights. And when he had taken his position in the air traffic control tower, due to his own overconfidence, he had not paid the necessary attention to the report of one of the young pilots. And this had caused a tense and dangerous situation during the flight. The navigating and vectoring officer of the air traffic control tower was also at fault for the complicated situation in the field.

This fact proves that in order to vector correctly one needs not only great experience, high qualifications and some special individual qualities, but also systematic and purposeful training of the entire personnel as well as exercising constant operational control. The basic requirements for this purpose are listed in the designated flight manuals. The experience of the leading units shows that only strict observance of the directive marked in these manuals guarantees perfect results in achieving high quality performance and safety in flights.

Receiving and analyzing the incoming infirmation, the controller must consider not only the circumstances at that precise moment and the images on the screen, but also anticipate the subsequent situation. He must be able at any moment to separate the most pertinent information from the main stream of incoming positions and at the same time remember the prior information as well. The rapid change of circumstances, the different messages coming in from different relay channels, the immediate decisions and the great responsibility involved, increase the psychological tension of the traffic controller and the specialists working under him.

Many conditions have to be complied with so that the controllers can sequence the flights according to schedule. One of these conditions is to plan correctly the number of airplanes and helicopters that have to be directed simultaneously by the unit. Experience shows that errors may occur if more planes are in the air than the scheduled optimal number.

It is exceptionally important that during the preliminary training and actual practice at the air traffic control tower, together with the purely professional skills, the specialists and mainly the future controllers also show skill in analyzing and predicting flight conditions, in making quick decisions and handling a great volume of information at the same time.

The staff of the aviation section plays a very important role in the organization and directing of the flights. On the day of the preliminary training the section chief, through the staff officers and department chiefs and following the decision of the commander, personally makes the requests for the flight routes and the necessary means for directing the planes. He organizes the training and watches how the pilots use the equipments and simulators, supervises the studies of the controllers, collects data about the means and capacities of directing the flights and reports to the commander. The deputy commander of the political work plans and organizes the working political schedule together with the air traffic controllers in accordance with the tasks, character and peculiarities of the future flights. In the leading combat units the political workers, the party and Komsomol activists explain in depth the requirements of the light manuals, summarize and publicize systematically the successful experiences of the air traffic controllers, quarantee the vanguard role of the communists and the excellence of the Komsomol members in mastering aviation technology as well as the means for the most effective ways of flight directing in different meteorological conditions. Directing air traffic is one of the most important links in the total system of operations which contributes to the improvement of flight safety.

Therefore the training of air traffic controllers and their mastering of all duties and obligations should always be the most important goal of the commanders, staff, political workers, and party and Komsomol organizations.

FACTORS LIMITING NATO'S USE OF MILITARY POWER ANALYZED

East Berlin IPW-BERICHTE in German Vol 9 No 7, Jul 80 pp 10-17

/Article by Gerhard Basler: "Military Power in the Anti-Detente Concept of Imperialism: Aggressive Forces Increase Reliance on Military Factor--Growing Contradiction Between Imperialist Goals and Limited Possibilities--Increased Rearmament Endangers Peace and Security"/

/Text/ The basic deterioration of general living conditions in present-day imperialism incites its ruling circles to feverishly search for means and methods for halting and even reversing it. Over and over again, and especially at the turn of the 1970/1980's, attention is dangerously focused on the use, the expansion and the deployment of the military power of imperialism.[1] Considerable forces in the West try to return to the methods of the cold war era, when imperialist policy was known for brinkmanship: They have initiated a new round of rearmament and use their armed forces not only as tools for political blackmail but for direct and armed conflict with the forces of progress. To a far greater extent than only a few years ago these forces--which have achieved influential positions in the United States and other imperialist countries--are endeavoring to carry out a "correction," a"change in the trend" of the general direction of the international balance of power, especially by calling on the various types of use of military power.

That is also the nature of the so-called Carter doctrine. According to Z. Brzezinski, National Security Adviser to the American President, it is necessary "to have the appropriate military power to help direct changes in a positive direction," which must be so constituted as to "be in keeping with our values and compatible with our interests."[2] His colleague Harold Brown, U.S.Defense Secretary, underlines this with the emphatic and unmistakeable indication "that the efficacy of our foreign policy often depends on the military power backing it."[3] The aggressive and misanthropic practices of imperialism in the past 30 years have amply proven that these are not mere words.

In accordance with its socioeconomic nature state monopolistic capitalism, an exploiter system, inevitably breeds aggression, including its military

manifestations, and war. However, whether, when and how the military power tool of imperialism is used, depends largely on the international balance of power and the politics of the ruling circles. The politics of strength have always been the basic principle of imperialist policy. Ulrich de Maiziere, former inspector general of the Bundeswehr, for example, considers that armed forces "provide political scope to governments."[4]

The compulsive expansion of the imperialist military potential is thus a central element in the effort of the ruling circles of the monopoly bourgeoisie to once again emerge from the historical defensive and gain the political offensive. This holds true most particularly at the present time, when the change in the international balance of power tilts it more and more obviously against imperialism. "The less imperialism's opportunities for ruling other countries and peoples, the more angrily do its most aggressive and short-sighted representatives react," commented L.I. Brezhnev, general secretary of the CPSU Central Committee, citing the main reason for imperialism's increasing penchant for military solutions.[5]

Consequently, in the early 1980's influential forces in the West, especially the United States, noticeably exacerbated the international situation by setting their sights on rearmament and demonstrations of military might, and against detente, thereby increasing the danger of war. Their actions are dictated by the fear that the further implementation of the principles of peaceful coexistence might further narrow the foreign political scope enjoyed by imperialism for making its power and profit interests prevail. At the same time, and most notably so, they are motivated by the efforts of the military-industrial complex to use rearmament for obtaining long-term and reasonably sure maximum profits. Greater aggressiveness abroad is also designed to deflect attention from the many problems and weaknesses, the internal and external defeats of imperialism. In the first place, though, it is a matter of improving the status of imperialism in the conflict with the forces of the revolutionary world process.

Above all military power is to help imperialism to pressure the socialist countries from a position of strength. At the same time it is intended to raise substantial barriers to the economic and social development of socialism by compelling it increasingly to raise defense expenditure. At the same time military power is to serve as a potential threat not only in the struggle against socialism but also in the conflict with the other main streams of the revolutionary world process. The young national states are to be kept in subjection, revolutionary-democratic changes in the imperialist countries stifled either by armed force or the threat thereof, raw material and energy sources as well as the exploitation of the developing countries secured in all circumstances.

Imperialism uses military force in two main ways: As immediate and direct force, involving the open use of weapons (war, intervention), and as indirect, hidden and potential force threatening the use of weapons (troop displacements, provocative maneuvers, mobilization, "deterrence," violation of

air space, naval concentrations, and so on). Just let us consider the irresponsible manner, totally disregarding the peaceful interests of mankind, by which U.S.imperialism has used such methods in the recent past--from the aggression against Vietnam to the adventurist use of military forces against Iran. There cannot be the least doubt that any reinforcement of the quantitative and qualitative dimensions of the military potential for the aggressive aims of imperialism must precipitate the utmost danger. Nevertheless imperialism is meeting objective limits which restrain the use of its military power and, above all, prevent the eruption of another world war. The peace policy and real power of socialism, especially the USSR and the other countries in the Warsaw Pact organization, provide the main barrier to war and military compulsion. They have the greatest role in changing the international balance of power to the detriment of imperialism. Regarding the use of military power General Maxwell D. Taylor, former chief of the U.S.Defense Staff, regrets that "we no longer have the political scope available to us in the calm days of our postwar preeminence...Times have changed...We are no longer...able to use and maintain military power everywhere we would like."[6]

The decisive obstacle to the use of military force by imperialism is the relative military balance between the USSR and the United States as well as between NATO and the Warsaw Pact. This is the situation which, in view of the risk of self-annihilation in a nuclear inferno, deters the imperialist party from the use of its military arsenal against the Warsaw Pact countries, although bourgeois strategists would make us believe that this hesitation is due to the weapons development consequent upon the scientific-technological revolution in military matters.[7]

Other factors counteracting the use or the threat of the use of military force by imperialism are the noticeably greater weight of the developing countries, their newly achieved status vis-a-vis imperialism and the support given them by world socialism (which, somehow, also acts as a protective shield against imperialist intervention). And not least the peoples struggle for peace in its own sphere of influence (as demonstrated in the successful resistance to the introduction of the neutron bomb) limits the potential of imperialism for endlessly raising and using military power.

In recent years especially some obstacles to the use of military means have come to the fore. They resulted in part from the fact that imperialism is increasingly confronted with economic, political and social problems which cannot be appropriately--if at all--handled by military means, while economic means are definitely suitable. In other words factors other than military strength are gaining greater importance for maintaining the interests of the imperialist countries.

The scope of the imperialist system in this respect is also narrowed by certain disagreements between imperialist countries and regions or among the various groups of the bourgeoisie within a country regarding the suitability, usefulness and dimensions of the use of military force in any specific instance.

Modified Views on the Use of Military Power

The situation of the state monopolistic system is characterized by the objective contradiction between the ambitious targets of imperialism "supported" by a steadily expanded and enormous military potential and the limited possibilities for really using this military might to influence the course of the historical development in the international arena. This contradiction is the expression of as well as an element in the general crisis of imperialist foreign policy. Not that this signifies the renunciation of the use of military power, but it does imply the necessity to operate in a narrower framework and with modified means and methods. Of course the powers of imperialism also acknowledge this discrepancy between potential and possibilities, and they attempt to come to terms with it. The acknowledgment of changes they have been compelled to accept has led them to seek new ways to improve the effectiveness of force as a means of imperialist foreign policy. British political scientist Laurence Martin expressed this endeavor when he wrote that the future does not belong to those "who deny usefulness to military power but to those who manage best to adjust it to the rapid development of politics and technology."[8]

When we more closely scrutinize the most important conclusions drawn by imperialist strategists and politicians from the contradiction between goals, potentials and possibilities of the use of military power, and which enter their foreign political and defense conceptions, we are bound to notice in this sphere also the endeavor to adjust politics and strategy to the changed conditions for the continued existence of the state monopolistic system. The tools of military power are to be made more flexible, appropriate and efficient. On the other hand we see here a clear albeit highly complex process of differentiation within the bourgeoisie regarding the best approaches and methods for using this power in these changed conditions. Here, though, I am able only to outline the main trends of this process.

The first conclusion emphatically impressed on the imperialist party (with merely a few exceptions) since the loss of U.S.nuclear superiority consists in the existential necessity of avoiding a "central" war between the United States and the USSR or between the two alliances. Even imperialist strategists admit that, "in a nuclear age" such a war would "signify the actual total destruction of our own society."[9] In the course of various treaties concluded with the USSR in the 1970's the United States had been compelled to formally acknowledge this fact. A total nuclear missile war is not, so to speak, considered a "rational method," although some particularly aggressive forces do think it justified in "an extreme emergency." Let us recall the words of Z. Brzezinski, National Security Adviser to the U.S.President, who said he would not hesitate in the appropriate instance to push the button to unleash the nuclear inferno. As we all know the material preparations for this contingency are steadily going ahead at full speed.

A second, fundamental and preeminent conclusion by all imperialist forces concerns the attempt to make military power feasible even more than hitherto as a means to exert political pressure, that is in an indirect manner, just because its direct use has quite definite limits. The purpose of the political use of military power is frankly expressed by the representatives of the bourgeoisie: It is said that armed force "may be useful even if not actively employed, that is used violently. Restrained arms availability acts as a threat or a warning...Military power impresses the nations which see it...It impresses and effects adjustment or, to put it in another way, produces voluntary good behavior in the meaning of the demands of the superior power."[10] Such methods are part of the daily arsenal of imperialism. By its own admission the United States used armed power "passively" (!) 215 times for political purposes in the years 1946-1975, 33 times on the brink of the use of nuclear weapons.[11]

Combination With Non-Military Means

Linked to this is a third conclusion. This concerns orientation to an even closer link between military and non-military forms and methods of the international class conflict. When evaluating his system of alliances V.I. Lenin pointed out that imperialist policy always consists of a "change in the forms of peaceful and non-peaceful struggle on one and the same soil of imperialist connections and interrelations between world economics and world politics."[12]

All significant forces of the bourgeoisie and its political and politological representatives assume the need for "combining military force, political efforts and economic programs" as a "counterweight"[13] to the challenges posed to imperialism by historical progress. In the final analysis this is merely the reflection of the general endeavor of the ruling circles of imperialism--aroused by the changes in the international balance of power--to regain the historical offensive by using the totality of means and potentials.

No sections of monopoly capital or its politicians and ideologues dispute the doctrine that, as a matter of principle, military power continues the "foundation stone" of the politics of imperialism.[14] The issue of the specific relation of military and non-military means of foreign political strategy (that is the specific accents) does, though, constitute the most disputed point among the various groups of the bourgeoisie. (We must note, however, that this is reflected mainly in the politological-conceptual sphere, much less in political practice, and that, moreover, the line is neither rigid nor unchangeable but rather fluid.) While a section of the ruling class assigns priority to the military factor in its direct and indirect use, another pleads for a balanced relation, and a third prefers non-military means without, however, eschewing military means altogether.

It all turns on the crucial issue of what will best serve imperialism in the eyes of the ruling circles in any given situation, whether short-term or long-term, so as to influence the international system, a particular country or a situation; what is "feasible " in view of specific realities. In short, involved is the usefulness of the deployment of military power. A second source of differences within the bourgeoisie (and it is one which poses the question of the relation between military and non-military means generally rather than usefulness in this or that instance) arises from a difference in priorities: If only for material-financial reasons, the group considering the economic internal and sociopolitical consolidation of capitalism the most important issue in the dispute between the systems, is less interested in demonstrations of military power. However, this group is currently very much in the minority; well to the fore are the champions of a more or less strongly emphasized policy of military strength.

A few of the bourgeois politologists are quite realistic. In view of the limits of military power they arrive at yet another conclusion. They wish to assign predominance to political means for safeguarding "security,"that is measures of military and political detente, in order--as FRG political scientist E.Forndran hopes--"possibly from a long-term aspect" to shift "the various political elements of a general security concept toward non-military security." [15]

Speculations on the 'Feasibility' of Wars

A fourth deliberation by imperialist strategists led to the concept of a selective approach to the use of military power. Politicians "should not embark on the frequent or hasty use of military power...abroad; such forces should be deployed only in special cases," advise the authors of a paper by the influential American Brookings Institution.[16] Any decision to threaten or use force should reflect regional, factual (the so-called vital interests) and military considerations. Relevant criteria were drawn up in the United States with the aim, for example, of ascertaining where and how to use the still available scope for the use of military power (especially in its direct forms) without calling forth developments and entanglements undesirable for imperialism, let alone new defeats.

Quite cynically they assume that "war per se has not become useless," and that the destructive force of military power could well be used to settle political conflicts.[17] Of course the imperialist strategists are well aware that, in view of the international--especially military--balance of powers, this would be an "exception," but they are all the more intent on exploring the remaining possibilities of such exceptions and tackling the corresponding conceptual and material preparations. To a large extent these deliberations are dominated by new weapons developments, especially those based on advances in electronics (accuracy, regulation of effect, controllability), which either result in new military-strategic conclusions or are specifically planned and introduced from new military-strategic standpoints. Christoph Bertram, director of the London International

Institute for Strategic Studies, well described the nature as well as the purpose of such developments: "The characteristic of the new weapons...is the advantage of their use in the nuclear-strategic as well as the conventional sphere," the new technology, he says, offers advantages mainly for a surprise attack (!).[18]

In the final analysis the many and various military-strategic conceptions drafted while taking into account constantly new individual aspects are always different variants of a war which is regional or "limited" (as far as weaponry is concerned). The range of war variants is thereby to be expanded with the smallest possible risk for those which start it, while they maintain "control" of the possibility of escalation to general nuclear warfare and the variants remain as effective as possible. Let me indicate here only one of the many such variants--the endeavor to convert nuclear warfare also into an effective tool of foreign and military policy by opening up options and stages.

According to a bourgeois expert in the United States, "an increasing acceptance of the concept of nuclear war" is to be found "among American strategists." "Once again strategists are thinking the unthinkable--they debate the circumstances in which they would begin and dare undertake nuclear warfare."[19]

Nor are we faced merely with a theoretical discussion: NATO, according to a Pentagon adviser, has already taken steps toward providing for itself the appropriate capacity.[20]

The "limited strategic war" doctrine is one of the constructs within the "low risk" nuclear war concept. According to American notions it envisions a first and surprise nuclear strike, aimed especially at particularly important military rather than civilian or economic targets. The speculation runs that this would decisively weaken the military power of the opponent (in other words the USSR), while "generously" leaving him some chance for survival. At the same time it is hoped that, in the aftermath of such a first strike, the opponent would not unleash all counteroffensive weapons but aim for only limited targets.

This clearly demonstrates several points: The striving for a "first strike capacity" and, therefore, greater emphasis on the arms race; the adventurism of the illusions harbored by imperialism as regards its--hoped for--superiority on the one hand and the corresponding weakness of the "opponent" on the other; and, lastly, the unscrupulous misanthropy and danger of this concept. A well-known American defense expert could not help but confess that there are critics in the U.S.camp "who argue that more useable nuclear power represents a potential which makes its deployment more likely."[21] At the same time politicians and military men consciously toy with the risk inherent in this increasing probability. U.S.Defense Secretary Brown (under whose direction intensive work is being done to provide the material-technical prerequisites for this strategy) made this quite

plain by cynically admitting: "It is impossible to be certain that the initial use of nuclear weapons against specific targets--however selected --may not result in escalation up to the exchange of unlimited nuclear blows."[22]

Strenuous Expansion of the Imperialist Military Potential

In the early 1980's imperialism represents itself as the system pressing forward with rearmament and the development of the armed forces in unprecedented qualitative and quantitative dimensions, at a significantly greater speed, and in a comprehensive and worldwide manner. This is to provide the prerequisites for even better, more effectively and, above all, more emphatically using military power in its two main forms as an instrument of imperialist strategy.

The most prominent feature of the endeavors to strengthen and improve defense materiel is the effort reflected in matters of policy and defense to regain military superiority over socialism. It is the attempt to reverse the existing approximate military balance between socialism and imperialism in favor of the latter.

U.S.Defense Secretary Brown made this abundantly clear on 19 September 1979 when, addressing the U.S.Senate Foreign Relations Committee, he announced that the NATO conventional rearmament programs already tackled meant "that the alliance...might achieve a definite advantage by about the mid-1980's" and would then dispose of a potential sufficient to "more than balance" the efforts of the Warsaw Pact.[23]

Many rearmament programs serve the striving for military superiority in the strategic as well as the regional sphere. Strategic superiority is envisioned, for example, by the build-up of a "first strike capacity" using the latest discoveries of science and technology and the emplacement of new medium-range nuclear missiles in Western Europe. Regional superiority is to be achieved by, among others, improved conventional weapons, greater mobility and the modernization of the tactical nuclear weapons arsenal.

All this is justified with the lie--deliberately and more and more shamelessly formulated--of a military threat to the West from the socialist community of nations, especially the Soviet Union. The open claim to U.S.military superiority has changed an important element in imperialist strategy. In the early 1970's we were able to note an at least verbal readiness (in the United States also) to realize a compromise between the various wings of the bourgeoisie on the basis of a certain enforced acceptance of the concept of strategic parity and the principle of equal security.[24] The profession of the principle of equal security was indeed the basis of a certain enforced acceptance of any prospect for the success of the efforts for arms limitation. We must therefore take very seriously indeed the remarks by representatives of imperialism, which actually deny these positions.

Four main aspects characterize imperialist rearmament efforts: To be cited first is their quantitatively new dimension and dynamism. NATO wasted some $2.6 quintillions on arms in its 30 years of existence. In 1979 it officially announced a $211.5 billion arms expenditure; through 1985 the United States alone aims to spend $252.3 billion annually on defense (1981 plan: $165 billion). Plans provide for a 3 percent annual average rate of increase in real terms, that is deducting the rate of inflation. The United States and the Federal Republic of Germany serve as the pacemakers in the NATO Alliance and currently are speeding up this rate, aiming at 4-5 percent! As it is the FRG has rearmed immensely; its defense spending is second only to that of the United States (1980 more than DM60 billion). In the words of Defense Minister Apel this rearmament is "to advance full speed ahead in this and the coming year."[25] Japan also raised its defense budget quite spectacularly, from 1.3 trillion Yen in 1975 to more than 2 trillion Yen (roughly $9.5 billion) in 1979.

The second aspect concerns the totally altered qualitative dimension of rearmament. At the present time this is the predominant feature of the endeavors to expand the imperialist defense potential. Using the achievements of the scientific-technological revolution and enormous financial and other resources, more and more weapons are developed or perfected and taken into service.

At the same time the following crucial trends in imperialist arms and armed forces development are emerging; they are embodied especially in NATO's long-range program and U.S.plans:

-- Modernization of the nuclear and conventional arsenal of all sections of the armed forces and weapons types, especially from the aspect of quality (new weapons systems, improved precision, weapons with controllable effect, and so on--to be specific: MX 1, mobile intercontinental missile, Trident submarine system, Cruise missiles, a new generation of multiple warheads (MARV), precision guided conventional weapons, and so on);

-- Measures for the major improvement of combat readiness (qualitative perfection of weapons systems, greater penetration and firepower, improvement of mobility, expansion of air defense, improvement of reserve mobilization capacity, improvement of important national and international guidance systems, and so on);

-- Deepening of the military integration of NATO regional armed forces (the interlinking and cooperation of armed forces consonant with uniform strategic principles, improvements in tactical and operational coordination, standardization of leadership and deployment principles, and so on);

-- The creation of globally deployable and constantly available mobile sea, air and land forces as interventionist units, in particular against countries of the Third World;

-- Expansion of the infrastructure and command structure as well as standardized logistics;

-- Improving the capacities for transporting reinforcements, especially in the context of worldwide distances;

-- The provision of a better and more comprehensive potential for electronic combat;

-- Efforts to achieve uniformity, standardization and compatibility of weapons and equipment;

-- Effective rearmament cooperation.

A third new feature is the fact that, since the late 1970's, strenuous rearmament for the first time involves all three main centers of imperialism, in other words Japan also,[26] though the NATO sphere continues the most important center of imperialist military power and arms escalation.

The fourth aspect to be mentioned is the steadily more obvious tendency to increase the timespan of the strenuous rearmament by the main imperialist powers. That was most evident in the NATO long-range program. Subsequently every real step toward arms limitation and disarmament was immediately postponed to the distant future if not ruled impossible altogether.

The increased expansion and use of the imperialist potential for threats and intervention with regard to the national liberation movements also represents a hazard to world peace. The upsurge and deepening of the national liberation movements and the new stage of the developing countries challenge to imperialism have obviously caused influential circles of monopoly capital to fall back increasingly on the traditional weapon of military force in its various forms in order to "secure their interests" in the so-called Third World.[28]

Strengthening the Imperialist Military Blocs and Alliances

Imperialist strategy for the conduct of the clash between the systems has lately assigned increased importance to military blocs. That is due in particular to the following fact: Military alliances are an immensely important embodiment and significant instrument of the military power of imperialism. Military blocs are considered an indispensable means for promoting the combination of all the potentials of the capitalist systems required in the interest of the maintenance of class rule. They also are to realize the principle of "total force" which, "controlled by way of military blocs," provides for "the coordinated, proportional and planned development of all military useable potentials of the imperialist system."[29]

Moreover, military combinations also represent a specific type of movement between imperialist contradictions and the changing balance of power. In

its capacity as the major military power the United States can claim leadership in the capitalist world particularly well by way of military blocs. Furthermore it is able to use this advantage in other spheres also, such as in economic relations. At the same time and within the framework of the alliances other imperialist centers, regions or certain key countries obtain greater scope--consonant with their enhanced role--for going after their specific targets. Lastly regional defense pacts have again gained general weight and importance in the defense strategic concept of imperialism. On the basis of the approximate military parity at the "central" level (United States-USSR) the imperialists concentrate on making feasible the conduct of regional wars.

NATO--The Main Tool of Imperialist Aggressive Policy

From the standpoint of imperialist politicians and political scientists NATO continues the most important and strongest politico-military alliance and the main instrument of imperialist policy in the struggle against historico-social progress, especially the socialist community of nations. NATO has become the center of gravity, the pillar of the efforts to maintain and expand imperialist power, the most important coordinator of imperialist policy vis-a-vis the forces of the revolutionary world process.

In the further pursuit of their current policies the ruling circles of the NATO countries--headed by the United States and the FRG--have four main targets relating to the development of the North Atlantic Pact:

a) Combination, modernization, the greatest possible uniformity and, above all, the maximum reinforcement of the aggressive military potential of the allies, in order to be able to conduct the conflict with the forces of the revolutionary world process from a position of strength.

b) The guarantee or achievement of the most uniform possible strategy and policy of all member countries vis-a-vis the socialist nations and concerning central issues of international politics. According to the concepts of imperialist strategists NATO is to be made even more of an instrument by which to manage the extent of detente, regulate the speed and dimension of this process for their benefit and exploit detente in the imperialist interest. Here the alliance is to be used mainly for coordination, and it must be noted that NATO in general displays a strong tendency to block any advance in the process of political and military detente.

c) Realization of NATO's claim to worldwide effectiveness. In the view of important representatives of imperialism it will be especially necessary for NATO to take on a larger role in the struggle against the forces of national and social liberation in the developing countries (in particular Africa, the Near and Middle East). The imperialists are therefore intensively aiming and working for various types (direct intervention, support for pro-imperialist forces, the creation of "accession" pacts, expansion of the NATO sphere), the extension of NATO's field of operation in these regions. NATO here has a coordinating and flanking role.

d) Reinsurance for the state monopolistic rule within the member countries. The leading NATO countries are intent on assigning policy coordination, the build-up and use of a menacing and possibly interventionist potential to the Atlantic Alliance in conjunction with the EEC and other institutions. This has the purpose of repelling the upsurge of progressive forces in their own sphere of power, noticeable in particular at NATO's southern flank.

Of course the implementation of these four targets is not without its own problems. International realities and processes, internal problems and contradictions influence events within the Pact. Consequently the opportunities to carry out the strategies and actions developed affect the shape and dimension of their implementation. However, the outlines sketched here are likely essentially to determine the line and image of NATO in the years to come.

Efforts to Establish Pact Systems in Other Regions

While NATO is the most important military alliance of imperialism its expansion is not the only one to reflect the intensification of military blocs at the present time. Japanese-American defense ties, for example, have increased considerably.[30] For a few years past we have also seen the beginning of contacts between NATO and Japan. The heads of the Japanese defense agencies repeatedly visited NATO headquarters as well as the most important West European member countries. Delegations from the arms industries also exchanged their experiences.

Of prime importance in the imperialist defense strategy in Asia is the alliance between the United States and South Korea, one of the most heavily armed countries in that region, which--from the imperialist viewpoint--is charged with immediate tasks in the confrontation with real socialism in the shape of the Korean Democratic People's Republic. Here also ties have been strengthened; Seoul is more and more acting as a "deputy." Within the framework of a long-range program the Americans are building up and modernizing the South Korean armed forces; in November 1978 a joint American-South Korean supreme command was set up. The plans go even further: "Activated in recent years was the...triple alliance Washington-Tokyo-Seoul."[31] In this connection we see firmer links between Japan and South Korea, transcending the former close economic cooperation so as to involve defense also.

Activated at the same time was the ANZUS Pact involving the United States, Australia and New Zealand. Combined maneuvers are more and more frequent, extending well into the Indian Ocean--and this is something quite new. There are plans for the eventual inclusion of Japan and some Oceanic countries. Also to be noted are regular naval maneuvers transcending the pact by involving British and Canadian naval forces. The fact is also significant that the New Zealand and Australian Naval units may, by an adjustment of strategy and tactics, "in the case of war operate as part of a NATO unit."[32]

Furthermore there are deliberations and efforts aimed at building up or strengthening regional imperialist defense alliances outside of Europe and the Pacific region. Let us recall the efforts to set up a South Atlantic Pact (SATO--to include South Africa, Uruguay, Argentina, Chile), to establish an alliance on the Persian Gulf to replace CENTO, the Rio Pact in Latin America (OAS), or the military aspect of the axis Washington -Cairo-Tel Aviv.

In the calculations of imperialist politics the military aspect of the alliance between imperialism and the Beijing leadership is quite preeminent. Both parties consider this dangerous alliance part of the encirclement strategy against the USSR and the other countries of the socialist community. Following a visit to China U.S.Defense Secretary Brown precisely defined the nature of this alliance: "We have parallel interests in various parts of the world. We intend to initiate parallel operations."[33]

He indicated one such "parallel" action--support for the counterrevolutionaries operating against Afghanistan from Pakistan.

All the most important NATO countries maintain some kind of military contact with Beijing, albeit the intensity varies. Reciprocal visits by military delegations and transactions in the arms sector have become "normal" events. Most advanced are the military relations between Beijing and the United States, though we should not overlook certain contradictions between Beijing and Washington, which set limits to the two countries alliance from defense aspects also.

Imperialism tries with all its might to use its military potential in the most varied forms for its foreign political goals. It will need the full strength and power of the socialist community of nations as well as of all peace loving forces to frustrate these dangerous plans and actions. The peace program submitted in May 1980 by the Warsaw Pact countries points the way.

FORMER MERCHANT CAPTAIN DESCRIBES ARMS SHIPMENTS, LIFE AT SEA

Bonn DIE WELT in German 21 Aug 80 p 4

[Article by Ruediger Moniac: "How the SED Keeps Its Sailors in Line; the Captain Who Came From the East"]

> [Text] For almost 20 years Captain Peter Rueffer (44) sailed on GDR ships. Three weeks ago he fled to freedom in Hamburg with his 18-year old son Marian, whom he had hidden on board the MS Freital. He left his wife and a 13-year old son behind. Rueffer is now hoping that the family can be reunited. In a conversation with DIE WELT he recounts his experiences in the East German Navy and later in the merchant marine. He describes how GDR ships take tanks to Africa and what he experienced as a representative of the VEB Deutfracht Shipyard. Rueffer is now staying with friends near Kiel and hopes to obtain a position as officer on a West German ship.

Scarcely a year ago, in October 1979, Peter Rueffer, the captain of a GDR merchant ship, was presented with instructions that he had never had before: to ship tanks to Ethiopia. In a conversation with DIE WELT he remembers: "Of course I knew that the Soviet Union and the GDR were delivering arms to developing countries. But I had never experienced it myself." Captain Rueffer's ship, the Albin Koebis (7,500 gross tons displacement), was lying in Rostock harbor. He was informed by his company, VEB Deutfracht, only: "We are loading 'technical transportation'."

The Albin Koebis was to load the freight at night. Rueffer heard that the entire harbor area had been sealed off. Only "politically reliable" dockworkers were on hand. Under the cover of night, open freight cars rolled into the harbor. Their freight: old T 34 tanks, which the Soviets used to fight Hitler's Wehrmacht. Twenty were loaded by crane onto Rueffer's ship. Ten are destined for the Ethiopian harbor Assab, the other 10 for the Fremolino Freedom Front in Mozambique. This hot cargo was to be unloaded in Maputo. In addition, there was "technical equipment" in green

crates. Rueffer knew what that was: grenades, ammunition and Soviet and Czech built rapid-fire weapons. Some 3,000 tons were hoisted on board the freighter. But Rueffer did not have to deliver this "development aid" in Africa. When he boarded "his" ship the next morning to sail, he was no longer the captain. To his astonishment he learned that the company had transferred command to someone else. Why? Rueffer does not know exactly. But he does remember that he said to friends last summer: "Cargoes like that should be refused on principle." Obviously his remark was reported "to the top," to the local SED authority in Rostock and the State Security Service (Stasi). That was enough to relieve a captain at the crucial moment without any explanation. Rueffer had become a security risk for the system. For 8 months after that October day he was not allowed to board a ship. Until last June. The shortage of qualified personnel forced the company to let him sail as first officer. He told himself that a chance like this would never come again. Now he is in the West with his son.

Rueffer has had many experiences in almost 20 years of professional service with the navy and the merchant marine of the GDR. How does the GDR deal with nationals who have to be abroad in the course of their jobs? In an environment which is almost predestined to invite "desertion?" Rueffer can tell a story based on his own fate.

In 1968, when Rueffer had been captain on a freighter in the Mediterranean for only a short time, the GDR began to expand its maritime trading activities under cover of Soviet marine policy. It opened shipping offices everywhere. Rueffer applied for Athens. To prepare him for the "NATO country" he was assigned to the branch in Alexandria on the Nile by the company, which, in the interim, had come under state control. At the time the Russians were still in Egypt. Rueffer was working, unimperiled as it were, on "socialist soil."

The local GDR consul did not like how he behaved. Rueffer says: "I was only polite and open to meeting everyone. As for calling our money 'a joke'--I didn't mean anything by it." The consul was of a different opinion. Without Rueffer's knowledge he wrote to the company's head office: "Comrade Rueffer tried to gain quick popularity in the collective by his overly familiar behavior, behaving like an experienced man of the world who is at liberty to ignore certain principles of living abroad. In practical terms this came out in derogatory comments about our currency (a joke), in critical discussions of the customs regulations in seeking private contact with West German . . . nationals at the athletic club. We consider any assignment of Comrade Rueffer to a NATO country as extremely risky. Comrade Rueffer has not been told about this letter. Socialistically . . ." (Thanks to a lucky coincidence, Rueffer later succeeded in removing this letter from his "cadre file" in Rostock.)

A similar thing happened to him in 1971 in Cuba, where he took over the office in Havana a few months earlier "following good work in the GDR for

the VEB Deutrfacht Shipyard." He had sailed to Havana with his family. A single man is allowed to stay abroad for a maximum of 3 months, usually much too short a time to prepare an escape.

Rueffer recalls: "I had settled down nicely with my wife and children. I was enjoying my work, mostly because, by making an effort, I was getting good orders for the company." Naturally one condition for obtaining them was again "contacts," not only with offices in Havana but with foreigners as well. The GDR wants to turn a profit on currency transactions. According to Rueffer, that means it has to engage in cross trade.

One day in Havana, a businessman from the FRG telephoned Rueffer and asked whether he could arrange a meal for him and some business associates on a GDR ship. Rueffer refused politely but neglected to report this "contact" to his embassy. Two hours after the call the embassy was on the telephone: "Why didn't you tell us that you invited a West German to a banquet on a GDR ship?"

How did the embassy know about it? Rueffer is still asking himself that question today. Was his telephone tapped, did he have a bug in the room? In any case this "tardy contact report" was enough to send Rueffer back to the GDR as being unreliable. Once there he was told: "No possibility of being a foreign representative until further notice."

The informant system has been perfected not only in foreign countries, but on GDR ships as well. Since 1976, so Rueffer reported, a ministerial decree has existed for the preservation of order and security. It appoints the captain as the "political and specialized instructor of the crew." He has to direct their work "according to the resolutions of the party and the government." Naturally the captain has to be in the SED. No one says it straight out, explained Rueffer, but it holds true. The company has to see to it that as many crew members as possible are also in the party. The captain possesses a vital disciplinary tool in his dealings with the crew: a seaman's certification papers. They are not simply documents stating that the owner is a sailor. For him it is as valuable as a passport. Anyone having them withdrawn cannot continue going to sea. The authority to withdraw them rests with the captain. Before the ship reaches a "capitalist harbor" he has to instruct the crew to avoid any contacts. Shore leave is granted only to groups and for a few hours only. Besides, the sailors have so little money to spend (DM 3.50 per day) that they can scarcely afford to buy anything, and certainly not an escape.

The position of "political officer" on the Soviet model has also existed on GDR ships for more than 3 years. According to Rueffer he is the "party's executive organ on board." With his "help" the informant network is working better than ever.

BRIEFS

POSSIBLE SEMINARIAN EXPULSION--According to reliable reports from Budapest, 15 members of the Central Seminary [Kozponti Papnevelo Intezet] issued a statement of solidarity with one of their fellow seminarians, Gyorgy Kocsi, who maintained contact with catholic groups not officially recognized by the State Office of Church Affairs. Due to his contacts, the ordination of Kocsi became subject to doubt. Laszlo Lekai, archbishop of Esztergom and Istvan Bagi, bishop-rector, termed the statement of the seminarians "open rebellion" and called for strict punishment of the signators. Allegedly, Cserhati, bishop of Pecs assured the protestors of his sympathy. Facing explusion are primarily the four seminarians who personally delivered the statement to Archbishop Lekai and Bishop Bagi: Jozsef Lanko, Gyorgy Szekely, Zoltan Uzsaly and Janos Wildmann. NORWEGIAN PRO-PRC ORGAN REPORTS FROM GDANSK ON STRIKES

Norway Union Supports

Oslo KLASSEKAMPEN in Norwegian 28 Aug 80 p 0

[Interview with Torstein Arnesen by Arne Jorama]

> [Text] "International workers' solidarity means supporting the Polish workers' demands, not pointing a finger at them and urging 'caution.' Obviously there is a limit to how far the Polish workers can go. The Soviet Union is still hovering in the wings. But I am convinced that the Polish workers themselves know that limit best."

That is the comment of Torstien Arnesen, chairman of the Telephone Exchange Installers' Union, on the highly controversial question of international support to the Polish workers. His union adopted a resolution of support that was reported in KLASSEKAMPEN yesterday.

"A free and independent trade union movement is just as important for the Polish workers as for us. They are stressing that demand as the most important. It is a demand that every shop steward and every organized worker in Norway will understand the importance of and should support just as we support workers in Portugal, South Africa, and South America."

[Question] Half a million workers all over the country are now striking for the same demands, and the strike seems to be quite well organized. What do you think is the explanation for the fact that this can happen in Poland? Such a strike movement seems entirely unrealistic, for example, in Norway.

[Answer] First of all, we are dealing here with the most open society that there is in East Europe. The treatment of opposition groups in Poland seems to me to be a good deal milder than in Czechoslovakia and the Soviet Union. In Poland at least they do not land in a mental hospital, but are quickly released as a rule after arrests. It is natural that they react to meat shortages and price increases.

What we in Norway can perhaps learn something from most easily is how fundamental the right to strike is for working people. Union members here in Norway should keep an eye on the forces in this country that want to take the right to strike away from us.

At the same time that there are limits to what the Soviets will stand for, the situation is that they have problems in many other places right now. That does reduce the inclination to intervene.

[Question] The Norwegian LO [Federation of Trade Unions] has its contacts with the state-controlled union movement in Poland. Should those contacts be broken off now?

[Answer] It is hard to say right now. We do not yet know the concrete content of the free trade union movement in Poland. For example, we do not know whether they want a union movement inside or outside of the Polish LO. It may well be that their objective is for the Polish LO to be transformed into a free trade union movement.

[Question] What do you think about the attitude of the LO leadership?

[Answer] I have read that they have decided on a statement of support by the Norwegian LO. But until I know what that statement contains, it seems to me it is difficult to comment on it accurately.

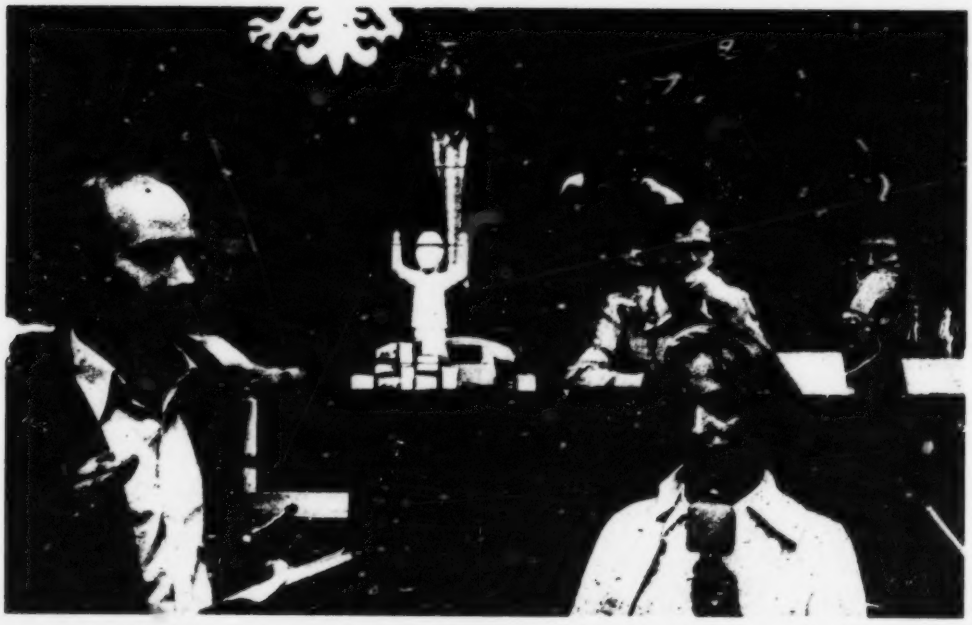
So says Torstien Arnesen, who feels it natural to debate the international parts of the LO's program of action in the light of what is happening now in Poland.

Afghanistan, Czechoslovakia Demands

Oslo KLASSEKAMPEN in Norwegian 27 Aug 80 p 15

> [Text] Well, we have gotten into the world press. Our little performance at the strike meeting in Gdansk was duly--but unfortunately very erroneously--reported in the otherwise well-informed and accurate big French newspaper LE MONDE.

As reported in KLASSEKAMPEN Saturday [23 August], KLASSEKAMPEN's special correspondent was asked to talk on the Lenin dockyard about the demonstrations of 21 August in Norway. We did so; what we were to say was translated and written down in Polish, and the appeal was read out in Norwegian. Lech Walesa, the strike leader, thought the content was a little too political, and asked the interpreter whether he could change it a little. The interpreter immediately put the question to the meeting--which would not permit any changes! And all the resolutions were presented to the meeting --against the occupation of Czechoslovakia and Afghanistan and for the Polish workers' fight. And just behind us sat a calm strike leader, grinning broadly. And what did LE MONDE make out of that? We quote from an article of 23 August:



KLASSEKAMPEN's correspondent, Tuva Gry Øyan, talking at the strike meeting in Gdansk about the demonstrations on 21 August in Norway. In the background, members of the strike committee.

"And then it was the turn of a woman activist from the Marxist-Leninist party in Norway to spout a lot of nonsense and launch into a harangue against the intervention in Afghanistan. It was too much, since the leaders of the MKS [Inter-Factory Strike Committee] had spent the day--as a counteroffensive against the government's propaganda--explaining that it is a trade union movement and not a political movement, that it is not a fig leaf for the opposition, that it is not hostile to the USSR and does not favor changing Poland's alliances."

Well, well, LE MONDE--where were you during that particular meeting?

Local Party Chief Recants

Oslo KLASSEKAMPEN in Norwegian 29 Aug 80 p 16

[Reportage by Tuva Gry Øyan; photos by Leif Gabrielsen]

> [Text] "I swear on the cross that I am with you! I was wrong before, but now I have realized what is right, and have joined the strikers."

The man on the podium is little and short. When he comes forward to swear, we are aware of a small sensation. Our interpreter has just explained

I swear by the cross that I am with you!

that he is a local party boss who has now made common cause with the strikers. He is first secretary in the party in the little town of Pruszcz Gdanski, just outside the strike center of Gdansk. Not one of the real big shots, but snugly placed in the bureaucracy. Now he is on the Lenin dockyard as representative of three striking plants in his town.

While he is talking several workers have gotten up and come forward with shouts that we did not understand a word of. But the applause that follows his speech is surprisingly light.

"I Was a Potop!"

Like the prodigal son in the Bible story of our childhood, he stands there and has to listen while the leaders of the meeting recite before all those present what a "catalog of sins" he has: Delegate from his district to party congress after party congress, a safe position in the party's executive committee in the Gdansk province. "I was a Potop!" he says repentantly. He is likening himself to the principal character in a well-known novel by Henryk Sienkiewicz, the world-renowned Polish writer. In the book "Potop" the author has the Pole Andrzey Kmicic go into the service of the Swedes in the war against Sweden in the 17th century. The aged Andrzey realized that he had been taken in by the Swedes, and found his way back to his own people. For our friend on the Lenin dockyard it was not quite so simple.

Interrogated by the Workers

For as soon as he sat down again among the other delegates, the workers began a regular interrogation: What is your job? What kind of education have you got? Primary school, high school, technical school?

No, he had not gone to any technical school. How did you get the position you have got now? No other worker gets ahead so easy without education. And just what is your job exactly? What do you do when you are working? A colleague of the "accused," in the same delegation, undertook his defense:

"I have worked with him for 10 years, and can guarantee that he is a good fellow."

What job have you got now? How did you get that job? What do you work with? Who are you really? WHAT DO YOU WANT TO ACHIEVE?

"How long have you worked together?"

"Oh, well, 5 years."

"Then no doubt you can say what he works with. Is he in a production line, or does he sit in an office?

"Well, as for just exactly what he works with..."

No, that did not get the interrogation taken care of. The suspicion was sharpened. Was he an *agent provocateur*, sent out by the party to split the workers, or was he just plain dumb? The interpreters cannot entirely agree among themselves; one insists that the fellow is the party's emissary: "The party boss smell clings to him, the way he talks, the words he uses. He apologizes too much. 'I have a wife and children to think about,' he keeps saying. But who hasn't?" Another is less sure: "But most likely spontaneous strikes did break out in the three small plants he says he is representing. And the workers agreed to elect a joint strike committee. The party committee was still on the spot, and it put up opposing candidates and the election took place without anybody's thinking much about it."

Yes, I know, I was wrong, but I had a wife and children to think of!

Three Million Party Members

"But among the three million party members in the country the strike must have some support," we asked.

"Undoubtedly, among the ordinary members. I should think that at least 30 percent of those who are gathered here are party members," is the answer. "But that character is no ordinary member. He is a boss, who has made a very good thing out of his position in the party. That is why it is so hard to believe him when he says he is supporting us all out. For where was he before, when we might have really really needed his support?"

Atheist Swearing on the Cross

And the workers had several touchy questions in store.

"Why are you swearing on the cross? You are an atheist, are you not?"

The answer came straight out and with no attempt at explaining away: "I know that most of the workers are religious, and I counted on their believing me if I swore on the cross. This is the first time I have done it, but I will gladly do it again if you want me to."

"Why should you? Swearing on the cross or the red star is the easiest thing in the world." The formal meeting was over, but around our local "Potop" the waves of controversy still ran high. Should he be allowed to stay there, or be thrown out? Was he a scoundrel, or just dumb? Was he just pretending, or had he broken with the party as he said he had? A harmless opportunist, perhaps, who after serving the party for many years was now changing horses, because that looked like being the safest?

The crowd finally melted away, and he got to stay on the docks. The next day we saw him again among the other strikers, a little red-faced, maybe, but still right there.

POLISH-FRENCH CULTURAL RELATIONS NOTED

Warsaw ZYCIE WARSZAWY in Polish 16 Jul 80 pp 1, 2

[Interview with Jean-Philippe Lecat, French Minister of Culture and the Media, by ZYCIE WARSZAWY permanent correspondent Leszek Kolodziejczyk: "Culture Brings Poland and France Closer Together"]

[Text] Prior to his visit to Poland (16-20 July), French Minister of Culture Jean-Phillipe Lecat was interviewed by a ZYCIE WARSZAWY correspondent on Polish-French cultural relations.

[Question] What is the Minister's opinion on the subject of development of cultural relations between Poland and France?

[Answer] Both our countries are nations with a great past, the history and cultural heritage of which are particularly rich. It is obvious that all areas of the arts and cultural exchange developing between our countries make a profound contribution to the friendship which binds them and which leaves numerous evidences in cultural affairs. One is pleased with the role played in Paris by the Polish Institute and in Warsaw and Krakow by the French Institutes, the goal of which is to create and deepen public awareness in both countries toward their cultures. It is my wish that there could develop even broader exchange, which is already quite fruitful, between the youth of both countries. Last fall the French Culture Days in Poland and the Polish Culture Days in France, in various areas -- film, books, theater, recreation, music, and sculpture -- constituted an intensive area of exchange.

[Question] What areas of Polish creative activity were in the Minister's opinion particularly warmly received by the French public?

[Answer] Poland's creative artistic activity and cultural heritage are perceived by the French to be close enough to our own to evoke a strong response, and sufficiently different for this exchange to be received with constantly fresh interest. Among those areas of artistic creativity which found particular favor with the French public, I should like to mention our enthusiasm for Polish music, cinema and theater, as well as Polish folklore

and graphic art, which is so admirably represented by Polish poster art. I should also mention the success enjoyed in France, at the Culture House in Nanterre, by the play by Witkiewicz in a Andrzej Wajda production, and I might also mention numerous showings of Polish films throughout France. We would also like to see more collaboration between French and Polish cinematography. I hope that Andrzej Wajda's projects in this area reach fruition.

[Question] How does the Minister interpret the certain disproportion between French cultural presence in Poland, which is more extensive and deeper than the Polish cultural presence in France?

[Answer] Noting development of cultural relations for the purpose of deepening Polish-French friendship, we are all concerned with the question of what means to undertake in order to strengthen the presence of Polish culture in France. Together with the French Minister of Foreign Affairs, we attach great importance to increasing all forms of dialogue between our two cultures and to making the French public even more aware of Polish culture. From this standpoint the mass media would seem to be very important. Greater film and TV collaboration and publication of modern works of Polish literature in the French language seem to me to be in this respect basic means leading to an increase in interest in Polish culture by the French public. I would also like to see more frequent holding of Polish culture weeks, both at the local and national level, and I would like to see them representative for the culture of both countries. Incidentally, all these projects are being incorporated into a three-year cultural exchange program to be discussed by a mixed commission.

[Question] Mister Minister, what plans for stepping up mutual cultural exchange will you be taking to Poland?

[Answer] Completely separate from the culture week, we shall be presenting important plays, after the model, for example, of the Renaud-Barrault Theater, which took part in the most recent festival of international theaters in Warsaw. The Rolanda Petit Ballet is preparing for a tour in Poland scheduled for June of 1981. In the area of plastic arts exhibits, we are planning an exchange between the Pompidou Center and the Polish museums in Lodz; there are also plans for a future Charles de Gaulle exhibit, to open in Warsaw next fall, as well as a series of events in November dedicated to Apollinaire. I should also like to mention a very important area, that of exchange of information in the area of preservation of works of art and monuments. A seminar of Polish and French experts in this field will be held in Nancy at the end of 1980. I should also like to express the wish that other persons active in Polish culture follow the example of Andrzej Wajda and come to Paris to collaborate with our artistic centers. And I should like to state that my plans include talking with Minister of Culture and Art Zygmunt Najdowski.

[Question] Mister Minister, what role in your opinion can be played by development of cultural relations in the process of détente between European countries?

[Answer] Culture plays an indispensable role in bringing peoples closer together: it arouses interest, which penetrates people's minds and hearts, in the traditions, way of life, in the cultural heritage and creative affairs of other peoples. Thanks to culture a foreigner becomes "one's own," while peoples and societies can learn to know and understand one another better. From this standpoint cultural exchange between Poland and France is of a most highly exemplary character thanks to the outstanding results which have been achieved. I would like to see similar agreements based on cultural ties which are rooted deeply in both of our nations also extend to other European countries.

POLISH-FRENCH CULTURAL RELATIONS, PRINCIPAL THEMES OUTLINED

Paris LE FIGARO in French 18 Jul 80 p 4

[Article by Bernard Margueritte]

[Text] Mr Jean-Philippe Lecat, minister of Culture and Communications, yesterday began a 4-day visit to Poland, which should provide a new stimulus to the cultural relations between the two countries. These relations, incidentally, have already developed in a very harmonious manner, especially since the signing, during President Giscard-d'Estaing's visit to Warsaw in 1975, of a "declaration" on this matter, in some respects much bolder than the Helsinki accords signed afterwards.

What are the principal themes brought up during Mr Lecat's visit? There are basically four:

1) Cooperation in matters of restoration as much of works of art as of cities. The Poles have in this domain, and with reason, exceptional accomplishments. This is why, in this year of the patrimony, a French-Polish Congress devoted to restoration will take place in December in Nancy.

2) Exchanges from Poland with the Pompidou Center: a Polish exposition will be prepared in Paris while Poland will organize next year a Charles de Gaulle exposition. The exchanges should also extend to posters, photography, painting, to the theatre and to the avant-garde cinema.

3) Problems of the sale of French books in Poland and of Polish books in France: one of the objectives of the French party is to maintain the level reached by the diffusion of French books. However, the Poles hope in this respect that more translations of Polish works will be brought out in our country. But despite some successes (books by Kusniewicz) we remain a long way off in this.

4) Teaching and spread of the languages: French comes in third place in Poland in the high school, after German and English. According to the reform of the Polish system of education, all young Poles between thirteen and seventeen are now going to study a Western language. It is a matter of

seeing that this does not translate into a weakening of our position. Likewise, an effort is being made in France for the teaching of Polish: in three years, the number of high schools where the Polish language is taught has risen from 3 to 12 while Polish courses are given in 17 universities.

Therefore French-Polish cultural relations are going well. Poland is in second place with regard to the university accords concluded by France (60 universities or graduate schools have contacts with this country) and she is our third partner in youth exchanges. Currently, two thousand young people from each country are participating in these each year. The objective is to reach five thousand in 1983.

An accord in this domain will be signed, moreover, during President Giscard-d'Estaing's visit to Poland in September. In the course of the last two months, a thousand Poles have come to France on cultural exchanges. After all, France devotes to its cultural relations with Poland a budget greater than the one it uses with all of the other socialist countries together, except the Soviet Union.

So where are we heading now?

New perspectives are taking shape which Mr Lecat's visit will no doubt contribute to making concrete.

PROTESTANT-CATHOLIC CONTROVERSY OVER TERRITORIAL RIGHTS NOTED

Paris LE FIGARO in French 1 Aug 80 p 7

[Article: "Poland: The War of Religions"]

[Text] A bitter religious controversy has just broken out in Poland which already has enough with which to contend. Polish Catholics living in Warmia and Mazury, in the country's northeast, have, within the last few months, forcibly taken possession of five Protestant churches. Naturally, the Protestant Church has violently protested this action in which it is implicating the Polish Episcopate and even John Paul II himself, and has launched a campaign which some of the West German and Swiss press has taken up.

The inquiry into the facts of the case, however, shows that this campaign is, to say the least, excessive.

Before the war, 800,000 Protestants lived in this territory governed by Germany. Today there are no more than 3,000 or 4,000 and this number each year is dwindling since the Protestants are taking advantage of the move to reunite families to emigrate to the Federal Republic. On the other hand, following liberation, this area was populated by Polish and Catholic families who came from countries east of Poland which the Soviet Union had annexed.

Under these circumstances, the Catholics were left without any church whereas the Protestant churches frequently had no congregation. In 1972, therefore, the Polish Episcopate appealed to the country's authorities to grant acknowledgment that year of the ownership of the property not only to the Catholic Church but also to other religious persuasions. At the same time, the Warmia diocese offered to buy back 10 Protestant churches. It had to wait 5 and 6 years to conclude the agreements in only four cases.

One of these cases was that of the Rozogi church. The sale, however, was not concluded until after the Catholics had taken possession of this church already abandoned and closed and after many refusals to sell or rent it to the Catholics. On the other hand, no agreement was concluded at either Baranow, where the Catholics occupied a ruined church which was being used as a refuge for gangs of ruffians, nor at Spychowo, where the remaining 10

Protestants still refused to grant the 1,000 Catholics there the chance to hold their religious services with them, the church was then finally occupied and the Protestant authorities returned the rent which the Catholics had paid.

According to an official statement from the Warmia See, this lamentable affair also involves a question of pounds, shillings and pence. The Protestant Church has finally proposed the sale of the eight churches for the sum of 25 million zlotys, which is about twice the value which the civil experts estimated. This being so, the Catholic Church has been obliged to negotiate otherwise step by step against considerable odds.

What the Warmia and Mazury Catholics find most exasperating in the case, judging by what has happened in it so far, is that the Protestants apparently prefer to see their churches fall completely into ruins, to be used for potato storage, or if worst comes to worst, to be conveyed to civil authorities rather than to renting them or selling them to the Catholic Church. We can only hope that inspired by the spirit of ecumenism, this distressing problem will eventually be solved. But who, in Poland, in the present instance, is so much as giving thought to this ecumenism?

PRINCIPLE OF NON-INTERFERENCE IN INTERNAL AFFAIRS HAILED

Bucharest CONTEMPORANUL in Romanian 27 Jun 80 p 12

[Article by Victor Duculescu: "Non-Interference in Internal Affairs--A Decade and One-Half of Unceasing Promotion of a New Feature in International Policy"]

[Text] The high principles, dynamism, and innovative spirit impressed on Romanian foreign policy by the 9th Party Congress represented, during the last 15 years, constant attributes of the international activity of our country. Romania and its president distinguish themselves as a vivid, effective presence, as one of the most active factors of contemporaneity in the fight for the cause of peace and progress of mankind. The history of contemporary Romania has never known such a dynamic, constructive period in international activity. Already, at the 9th Congress, Comrade Nicolae Ceausescu stated: "The international policy of our country has as a lasting, steady foundation--the principles of sovereignty and national independence, equal rights, non-interference in internal affairs, mutual advantage. Romania militates for the consistent promotion of these principles in the international arena, considering their observance as essential condition for developing collarboration among states, strengthening trust among peoples, respecting the inalienable right of every people to decide upon its destiny."

Building a new international democratic system based upon respect for the independence and sovereignty of all the peoples, upon the prohibition of the use of force and the threat to use force, requires the strict observance of the principle of non-interference in the internal and external affairs of any country. As a matter of fact, this principle takes on, more and more nowadays, like the other primordial norms of behavior of states, the importance of a fundamental principle of the international law and morality, which has its observance directly linked to the solution of international crises, and the affirmation of a free and independent life for each nation.

Historically, the affirmation of the principle of non-interference in the internal affairs of states and peoples is directly linked to the recognition of the idea of sovereignty of states, to the affirmation of the

independence of nations in the contemporary world. As it is known, the prevention of any foreign interference in the internal affairs of a people, its free election of its social or political system, the affirmation of a domestic and foreign policy in accordance with its national interests necessarily derive from respect for sovereignty. Enunciated for the first time in the works of several well-known theorists of the 17th and 18th centuries, such as Wolff, Puffendorf and Vattel, and entered in the documents of the 1793 French Revolutionary Convention, the principle of non-interference in the internal affairs of peoples was to be quickly forgotten by those who proposed to build up a European system based on disregard for the peoples' interests and on the balance of the relations of force among the then big powers. Proclaimed as a reaction against a possible foreign intervention on the American continent, the "Monroe Doctrine" was to turn also, in a very short time, into a policy of justifying North-American interests on the whole continent.

Although there were numerous reactions against the policy of intervention, the acts of interference in the internal affairs of peoples characterized a whole historical epoch of conflicts and violations of the peoples' rights, the policy of intervention, interweaving, in the course of time, with the manifestations of force and threats to use force and directly serving the attaining of the hegemonistic or aggressive aims of some powers interested in dominating other peoples. The history of acts of intervention is very long and comprehensive. The Romanian people, located at the crossroads of several big empires, had to firmly defend its independence and national being against many attempts at interference in its internal affairs. The counter-revolutionary attempts of interference in the affairs of the young Soviet state, the failed attempts to impede the success of the Chinese revolution, the neo-colonialist policy of "recouping" the young independent states, etc. are well-known.

In our epoch, the forms of intervention have been expanded and diversified--from political and military intervention to ideological or cultural intervention, from openly proclaiming the right to intervene in the affairs of some states or peoples to the most refined justifications which try to legitimate the interventions by "humanitarian reasons," satisfying various "superior interests" or, what is truly paradoxical, "protecting" the interests of the state which had its affairs interfered with.

The politological theories which start from the primacy of power in international relations and try to substantiate various models of organizing relations among nations based on the balance of the economic, political or military force, leave, in fact, an open door for intervention as a current practice in relations among nations. According to several western authors, "power" and "influence" might, in fact, be related concepts, if not identical ones. Even some "theoreticians" of international law who acknowledge that armed intervention would be prohibited by the norms and principles of law presently in force for relations among nations, do not hesitate to state that the simple "interferences" could, however, be permitted and

accepted! If the principle of non-interference in internal affairs, as such, established by the United Nations' Charter and by many international documents, cannot be questioned as a whole, one tries to demonstrate that certain exceptions to the incidence of this principle should, however, be accepted: those actions which states undertake in order to protect, as they pretend, certain superior interests, the values of civilization and human rights, the fate or belongings of their citizens who live in other countries, where they, supposedly, do not have enough "security" etc. The technique of having other principles of international law running counter to the principle of non-intervention, of attempting to classify the principles of international law as "chief"- and "secondary" ones, with those in the first category (collaboration, human rights etc.) coming before the principle of non-intervention, is widely used.

The attempts to justify interventions are taking on nowadays the most diverse forms; an appeal to domestic forces with non-existent or ridiculous political meaning is often made. The practice of intervention also knows a wide variety of interpretations of the international documents, just in order to justify actions of this sort. But there are many circumstances in which the norms and principles of law which are inconvenient for those who undertake acts of intervention are simply violated without resorting to any sort of justifications. As far as the practical methods of committing acts of intervention are concerned, these are varied and affect the most diversified spheres of the exercise of the national sovereignty of the people. The interventions may, first of all, refer to the domestic and foreign policy of states, trying to divert it from its natural aims of guarding the national interests, and may aim at acquiring economic positions in a certain country--to the disadvantage of the respective people and to create favorable positions for other countries concerned. Extremely dangerous are those interventions which aim at sharpening conflicts among certain countries, usually small- or medium-sized ones and developing states interventions which tend to perpetuate conflict and tension situations in certain regions, to involve the peoples in a policy of arms, preventing them from concentrating on their natural aims of raising the living standards, of building an independent life.

Socialist Romania firmly expresses itself against any forms of intervention in the internal and external affairs of states, since it considers that they disregard the sovereign rights of the peoples to decide their fate independently, to establish their own options for development in accordance with the national interests, since they artificially stimulate conflict situations, endangering peaceful collaboration among nations and peoples. In the view of our country, the acts of intervention represent a negation of international legality, of the democracy which should rule over relations among nations, a brutal violation of the relations of dignity and respect which are the only guarantee of peaceful cooperation among nations in our epoch.

The foreign policy doctrine of Romania, President Nicolae Ceausescu's view of the new international economic and political order, consider the

principle of non-interference in the internal affairs of peoples as one of the pillars of the future international democratic system, based on equality and equity, on the full and final prohibition of force and the threat to use force. The deep attachment of Romania to this principle is reflected in the fact that it is consistently, even without exception, established in all international documents signed by Romania, together with other norms of international behavior which must be observed for establishing a climate of international peace and security. The secretary general of our Party, the President of Romania, Comrade Nicolae Ceausescu forcefully stressed that conflict situations which have lead to tension phenomena in the international life, such as those in Africa, the Near East, Afghanistan and South-East Asia must be resolved by respecting the peoples' right to self-determination, putting an end to the interference in their internal affairs, respecting their sovereignty and independence.

In the view of Romania, there is a strong and indissoluble link between non-interference, respect for sovereignty and the right of every people to freely decide upon its destiny. The affirmation of a free and independent life, the protection of revolutionary accomplishments can only be achieved if the great principles of international law and morality which must rule relations among all the nations are strictly observed, if the policy of intervention and interference will definitely be replaced, in relations among states, by a policy of active cooperation, based on respect for equality, dignity and recognition of the sovereign rights of each and every people.

CONCERN EXPRESSED OVER FINANCING OF FEDERAL OPERATIONS

Effectiveness of Expenditures Questioned

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1543, 27 Jul 80 pp 8-10

[Article by Dragos Ivanovic: "How Does the Federation Husband Its Funds?"]

[Text] It is from the Federation that come our constitution, laws, decisions, resolutions, conclusions and an abundance of various sublegal acts. These enactments prescribe, advise or demand--especially in this time of stabilization--that we all behave more reasonably so that the economy as a whole and every individual at his work station conducts a more stewardly business operation.

Yet how does the Federation husband its funds? Whereas the talk and the writing go on at great length about the mistakes in enterprises, self-managed special-interest communities, and even opstinas, very little is known about the operation of federal bodies and agencies. In fact our knowledge about how funds are actually husbanded in society decreases as we climb up toward the "top."

Moment of Confrontation

But there is one moment during the year when the talk is more frank in this area. This is the assembly's examination of the final statement of the federal budget for the past year. Whereas the previous examination of this document was mainly routine and a formality, now examination of the final statement is a studious and critical examination of how federal bodies, agencies and organizations have been spending the money they get from the budget.

The assembly's examination of the final statement arouses interest and instills confidence above all because of the way in which this job is approached. The budget committee set up several working groups of delegates which for months has examined the accounts of several federal bodies, agencies and organizations. To that extent these will certainly have a stronger

response from the public when they are published, because they are authoritative.

Pictures and Works of Art

As is to be seen from these reports, the Federation possesses a considerable number of pieces of movable and immovable property. Though this is not exactly something one does not know, it is not a bad thing to insist on it once again, since the value of federal "property" is growing steadily, every year huge funds are allocated from the budget, as can be seen from the extensive programs for construction and modernization of various services. Merely the value of the fixed capital managed by the service for entertainment exceeds 100 billion old dinars, and this sector is by no means decisive to the economical business operation of the Federation.

Many of these items represent important historical, cultural and artistic value. Our attention is caught by the large "repository of pictures and other works of art," as stated in the report. It is quite natural that institutions at that high level should have works of art, but the trouble, and this also caught the eye of the delegates, is that the records on these items are poor, and they are not kept in exactly the best manner.

Nor is there any code of regulations on who and in what manner can make use of these rare and valuable items, and this gives rise to odd situations, to put it mildly. When certain officials change offices, they demand that the pictures and works of art be moved along with their desk!

Fine, that might even be a bizarre aspect of this serious issue. But what is most essential in all this, the thing that the delegates also emphasize, is that "there is a need in general to study the purpose for keeping this treasury of art in offices and basements, inaccessible to the public and to culture." And what is most important, there is a need in the end to state exactly who can acquire these valuable things and under what conditions.

Vehicles Running Around--Expensive

Or let us take the way in which vehicles are used. The garage of the Federal Executive Council has 74 models of automobiles belonging to 19 different makes, and two-thirds are big cars. In this period of dizzying price rises of gasoline and of expensive spare parts, all of this is becoming extremely uneconomical. That is why a law has been prepared which but for exceptional cases prohibits foreign cars to be imported for federal bodies and agencies, but certainly other economy measures will be needed in addition to this.

There is still no social compact which would regulate the manner of use of vehicles for all bodies, agencies and organizations in the Federation. Vehicles are used at personal discretion and for long trips, though there are trains and airplanes. Some chauffeurs complain that they are frequently

forced to wait for officials a long time at airports or in front of buildings where meetings are being held. Some drivers even work 15 hours a day for this reason.

So long as we are talking about cars, the following detail also attracts our attention. The garage has 19 buses and 5 minibuses which are mostly used to carry 1,200 office workers (which is only 7 percent of those employed). They "bring in" 5 million old dinars, but they cost about 650 million old dinars. They are also used frequently for trade union outings.

We Are All Suffering From the Same Disease

All these cases, though utterly different in domain and forms of use of the funds, have something in common: there are no optimum programs or clear regulations or agreements containing precise criteria as to when various things can be done or purchased. The reader will easily recognize this pattern for an ailment which is common everywhere. Almost all our enterprises and various other organizations also suffer from a lack of such documents, and there is public discussion, often backed up with arguments, to the effect that this is a breach through which tremendous public funds are madly leaking away.

The fact that improvisation is so widespread is certainly no justification for anyone individually.

It seems, nevertheless, that the consequences of the unregulated relations are felt most seriously in connection with the allocation and use of dwellings. Since the use of the dwelling for official use has not been clearly defined, some people hold on to them even when they no longer hold their position, though their family has a dwelling which is public property at their place of residence. "It is a rather widespread phenomenon to get more than one dwelling," it was said in the debate, "and for dwellings to be allocated to meet the needs of the extended family at the expense of the budget, which makes it difficult to resolve personnel issues."

Some Have More Than One Dwelling Unit

A goodly portion of the dwellings are allocated without going through the special-interest community for housing, and dwellings are also adapted without going through the community. The striking discrepancies are also noted in construction. Federal bodies and agencies fulfilled the 5-year program for housing construction at a level of only 17 percent, while the special-interest community of the Yugoslav People's Army fulfilled its program at a level of 104 percent. Both of them federal entities, but such a difference.

It seems equally strange that individuals should have a different status from one community to another. The rights and obligations of tenants are one thing in military housing, something else in a special-interest

community of federal bodies and agencies, and still something else in the housing community of Belgrade. Even in the same building there may be differences in rights and obligations which tenants are to exercise and discharge to the housing community. And how then is it with those who have their housing in the capitals of the republics?

The list of oversights established in the handling of funds might also be considerably longer. The programs for noneconomic investments of federal bodies and agencies was not, however, taken up on this occasion. This was left to later, but one can suspect that there are irregularities here as well from this clearly formulated remark:

"If associated labor knew how certain consumers of the budget are husbanding their funds, they would soon demand that all the laws be amended that hold those responsible for noneconomic investments in a privileged position."

A Welcome Coincidence

It was quite a random coincidence that the rebalancing of the budget for this year happened to be on the agenda the past few days in the bodies of the assembly at the same time as the year-end budget statement for last year. The coincidence, however, turned out to be a welcome one, since it afforded everyone a very worthwhile chance to supplement their knowledge on a topic that is always relevant--how does the Federation actually husband its funds?

Of course, the sponsor of the rebalancing of the budget was the Federal Executive Council, and this entire matter, according to the original explanations, appeared to be so indisputable and simple from the accounting standpoint that abbreviated procedure was even sought for amendment of the budget. It is a question of increasing the federal budget, which for this year amounts to about 130 billion dinars, by 21 billion, the amount by which the federal treasury has been left "lighter," partly because of the recent devaluation, but to a greater extent because of the drop in certain federal revenues.

But the delegates have made a fundamental political issue out of what might have appeared to some a more or less routine step. When a clear commitment has been made against everything lost through devaluation being made up in the economy through higher prices, why should the federal budget be allowed that privilege? So long as enterprises are economizing, let there be equal economizing in the Federation. Certainly they will in some respects feel the shortage of budget funds, but a new budget equilibrium can be established by restricting expenditures on the other side.

The proposal for rebalancing the federal budget was postponed for September, when it shall be taken up under the regular and not the emergency procedure!

This episode is certainly characteristic of the atmosphere at the moment in society, which can be expressed most easily by asking these questions which, to be sure, are constant ones: Are we all prepared to bear equally the burden of the inevitable stabilization?

Analysis, Statistics

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1543, 27 Jul 80 pp 8-9

[Article by Velizar Zecevic: "Budget Under the Magnifying Glass"]

[Text] When there is a particular liveliness in the benches of the assembly, it is the budget on the agenda. The accounts of the government have never been small, and the dilemmas are large. There are many people who are striving to find a more comfortable place in the shade of the government budget, but at the same time everyone wants the budget to be as small as possible and to be spent as optimally as possible.

This is just the third year since the new principles went into effect for shaping the federal budget under the new constitution and the Law on Financing the Federation. The system for financing the Federation is based on the principles of community unity, the needs and interests of all republics and provinces in performance of the functions of the Federation. The republics and provinces have a decisive impact on all budget revenues, as do expenditures determined in advance by specific laws. To be sure, the budget does have its own revenues (customs duties, a portion of the turnover tax), but if they prove to be inadequate, and this has always been the case in the last 3 years, the republics and provinces have to make up the difference through their contributions.

The system for financing the Federation, then, is clear and in conformity with its functions. The budget's revenues are precisely set forth and reliable. Everything is agreed on and established concerning expenditures. Nevertheless, whatever there is is spent, revenues are always greater than expenditures, and the so-called deficit financing of the budget has become a rule that has known no exceptions for some 10 years now.

This kind of situation with the budget is an expression of economic instability and inflation, but the budget itself, with its constant deficit and in view of the tremendous amounts involved (about 13 percent of the gross social product) is also one of the serious causes of instability. For years now the prevailing conviction has been that all budgets, that of the Federation above all, should not be increased, as it is put, faster than the growth of the social product. The endeavor to implement that principle has been set down in law for two sizable items of budgetary expenditures--the financing of the Yugoslav People's Army and supplemental financing of the underdeveloped republics and Kosovo--while other expenditures are limited by the level of total budgetary revenues, which are established every

year. However, the budget is adopted in advance, and not after the fact, so that differences between what has been planned and anticipated and what has actually taken place must be settled subsequently.

For that reason, but not for that reason alone, a budget deficit comes about which usually is a main topic of assembly debates when the budget is up for adoption. The deficit financing of the budget is not a new phenomenon in the world; many governments resorted to this solution several decades ago. Of the two possible ways of overcoming a shortage of budget funds--either from existing social accumulation or from future accumulation, by spending in advance--we, involuntarily to be sure, but almost regularly, have used a third--a portion of the budget, often as much as half, comes from the primary issue of money, that is, from that money which is issued to cover augmented production and the rise of prices.

The deficit, then, remains what it is. It can either be replenished, and that creates new budget expenditures for which one must set aside a larger share of the social product, or one must curtail some of the rights of those who live on the budget.

The order of magnitude is such that payment of what has been postponed or not settled up to now would so augment the budgetary spending of the Federation that more than 13 percent of the social product would be required to cover it all. And this would then signify that the principle that budget spending ought to grow slower than the social product would turn into its opposite: 7 years ago the federal budget took away 11.5 percent of the social product, though certain obligations of the Federation have in the meantime been passed on to the republics and provinces.

"The principal cause of problems in balancing the federal budget and deficit financing should not be sought in the system of financing the Federation, but in its practical application," engineer Petar Kostic said at a recent meeting of the Federal Social Council in Belgrade. At the same time, the federal secretary for finance conveyed to members of the council the position taken by the Federal Executive Council, to the effect that it is "indispensable to examine the division of the social product as a whole and the share of the federal budget in that context."

What can be done in this respect?

Without touching either the principle that the federal budget has its own revenues nor the arrangement embodying the system whereby the republics and provinces supplement the budgetary revenues of the Federation, it is obvious that the first reflections come down to two ideas--how to avoid deficit financing and in general to bring budget expenditure into line with capabilities?

Let us look at the breakdown of budget expenditures:

(in percentage)

	1977	1978	1979	1980
Financing the Yugoslav People's Army	40.3	41.8	42.7	45.6
Supplemental funds to the underdeveloped republics and Kosovo	6.6	6.9	8.1	8.6
Welfare of disabled veterans (military pensions)	14.6	16.1	15.1	14.9
Promotion of foreign trade	23.8	19.4	20.8	20.2
Personal incomes in federal bodies and agencies	3.8	6.1	6.3	6.0
Noneconomic investments	1.7	1.9	1.8	1.4
Obligations from past years	5.0	4.5	4.0	2.3

The very fact that 1 dinar in 10 of the social product created annually goes into the budget represents a serious reason for some serious talk about the federal budget. Otherwise any stabilization program will be incomplete or almost unrealizable.

ISAI STRESSES ROLE OF PARTY IN SOLVING ECONOMIC PROBLEMS

Tirana RRUGA E PARTISE in Albanian No 6, Jun 80 pp 5-16

[Article by Hekuran Isai, Politburo member and member of the Secretariat of the CC of the AWP: "For a Comprehensive Evaluation, Monitoring and Solution of Economic Problems, and Their Full Resolution"*]

[Text] In this session you have presented a number of problems and have discussed the ways to solve them, therefore, there is no need to wait for further incentives to put into practice some of the issues which have been discussed. Of course, problems which must be studied more profoundly and approved by the responsible organs in the districts and at the center were also presented here. Work therefore should start right away, planning and programming these studies and establishing the order of solution. Otherwise, if they are not acted upon in this manner, the result will be endless talks and discussions, problems will not be solved, and the situation will not change according to the party's guidelines and demands. If we permit irregularities in solving the problems, then the result will be manifestations of bureaucracy, liberalism and an academic attitude in scientific and study work, something which would harm the progress of work.

You are all aware that, as has always been the case, in recent years too, the party has devoted special attention to the problems of the economy. Comrade Enver Hoxha has submitted, analyzed and solved a host of problems in this field, and has opened to us new and broader horizons to understand and to solve the questions of our socialist construction and of the development of the economy with our own forces. You have studied these very important materials of the party and are familiar with the struggle and efforts being carried on everywhere to put them into practice.

We all can ascertain and note the great successes of our economy. At a time, when, in the capitalist-revisionist world, there are occurring all those

---

* Speech delivered to the scientific session on problems of the management and organization of the economy, organized by the Institute of Economic Studies attached to the Academy of Sciences of the People's Socialist Republic of Alganitt, and by the Economics Department of the Tirana University, held in Tirana 16-17 May, 1980.

regressive phenomena of the deepening of the general crisis of capitalism, of the profound economic crisis, of unemployment, inflation, of the energy crisis and so forth, our economy is healthy, stabilized and is continually and dynamically developing at high rates. It is successfully confronting the encirclement of the fierce imperialist-revisionist blockade. This is clear proof of the justness of the party line and of the lessons of Comrade Enver Hoxha; it shows the vitality of our socialist economic and social order, and of the clear and certain prospects for our development on the road to the complete construction of the socialist society.

But at the same time, you, along with all the cadres and the workers, are also familiar with the difficulties of growth and those of the fierce imperialist-revisionist blockade, with the important problems which the party has submitted to us, some of which you also have treated here. The aim of the work of the party and of all its levers in the economy, is for us to have the strongest possible economy to increase its effectiveness, to protect it from every negative phenomenon, or anything which could become a cause for the destruction of the necessary relationships which exist, and to further perfect these relationships.

The source of successes or of non-fulfillments, of course, is to be found in the cells of the economy, in economic enterprises and agricultural cooperatives. Therefore, it is there that work must be further strengthened.

No negative phenomenon, or anxiety over the development of the economy can occur if the demands of the economic laws of socialism, as well as the legal laws, the decisions, the decrees and regulations which the government has issued and issues in accordance with the party guildlines and directives and the demands of the objective economic laws of socialism are kept in mind and carried out. Therefore, comrade Enver Hoxha recommends that "The government has justly demanded and must demand with greater force the full implementation of decrees and decisions which it has issued, but they must be put into practice and control must be exercised by the grassroots, the section of the executive committee, the enterprise, the unit, the place of work, the individual, and so forth. Whoever is not familiar with them should study them, and the party and the administration must control their full implementation."

The work of the economist does not consist merely of raising the problem, and then sitting down and watching. When we say that class struggle is waged in the economy too, it means that all must wage this struggle better, including you, the economists, and we must not tolerate violators of laws, of decrees and decisions. Even when some manager declares: "Do as I say, because it is my responsibility, if you want I will give it to you in writing," and so forth, when he is mistaken, do not do what he says, but act according to the rules, laws and decisions of the party and of the government. But the economists, the specialists and the cadres fail to act precisely in this manner. Therefore, the Seventh Plenum of the Party Central Committee reiterated the need to improve the feeling of

personal and collective responsibility in carrying out the tasks, as a very important issue which must be put in the place that it deserves. Comrade Enver Hoxha has pointed out that "when you fail to implement the assigned tasks and rights, and when others adopt them, and, in a careless way, work in an irresponsible and routine manner, then you have caused, in the same way, damage to work and show incompetence in handling the assigned task."

Scientific research institutions, the higher schools, the cadres and the specialists at the grassroots and the central ministries, have carried out useful studies which have helped the party. But the issue is that those economic problems which appear as the most serious must find a greater reflection in scientific-study work, plans in the dissertations of the scientific workers and the theses of students, which are in the hundreds. No one has prevented our institutions from getting more deeply involved with these problems but they shirk, in one way or another, from difficult tasks, sometimes out of laziness, or according to the mistaken concept that "by keeping quiet, our names will also not be mentioned, hence we can avoid headaches," and so forth. All these ideas and attitudes must be severly opposed, and we must all put our minds and efforts in the service of the development of the economy, today and in the future. Among other things, it is imperative to draw the necessary conclusions from the recommendations of Comrade Enver Hoxha that "We must guard ourselves from narrow habitual practices, as well as from an academic attitude in scientific study activities, otherwise, if such manifestations are permitted, then one is dealing with everything, but not with science and study work."

You are working concretely, together with the working collectives, in drawing up the draft Seventh Five-Year Plan, therefore I will not present here all those great objectives which are expected to be achieved and which the party Central Committee and the government have made clear to us. But I will draw attention especially to the seriousness of the great tasks facing us in our intensive economic development in all directions.

First: we must continue the development of our economy by relying totally on our own forces, surely at high rates, much higher than the rates of population growth, and under very complicated international conditions.

Second: we must make a great leap forward, as never before, in the field of accumulation and expanded socialist reproduction, by aiming to secure material, financial and foreign currency resources necessary to realize capital investments of great proportions, about equal to those realized during the four 5-year plans (1951-1970) taken together.

Third: we must create over 185,000 new jobs, at a time when the average value of funds to create a new job position is increasing, and when 50-70 percent of the increase of social product is expected to be insured through the increase of the social productivity of work.

Fourth: we must make considerable steps forward to further increase the effectiveness of production expenses, in particular in industry, agriculture

and construction, by aiming for a more rapid increase in the national income than in the social product, so that the further intensification of the economy will be accompanied by the reduction in cost per each unit of the products, and due to this factor it will be possible to achieve close to 65 percent of the increase of net income of the economic enterprises so that out of the existing production capacities, along with their reconstructions and modernizations, close to 85 percent of the increase of the social product can be ensured, and from the increase of the yields of farm crops and of the productivity of livestock, about 90 percent of the increase of the total farm and livestock production can be assured.

Fifth: we must further develop the technical-scientific revolution during the next 5-year plan period. It will be faced with tasks whose dimensions will be larger than ever. We will have to design ourselves all construction projects; we must broadly launch the machine building industry, we must carry out a true revolution conserving and replacing scarce raw materials and those which are imported, with better and cheaper domestic materials, we must make extensive improvements in technology and in other fields of scientific and technical progress.

We, and our entire people, are rightfully proud that today our country, our socialist economy, our workers, are in a position to start and successfully complete such impressive projects. But we all must be extremely aware that these objectives and great tasks also require the mobilization, creative thinking and revolutionary initiative, of all the workers as well as of the economists, where ever they work and manage. There is, throughout, a need for mobilization and greater responsibility, effective sifting and utilization of the mental and physical forces and energies, the maximal utilization of internal resources.

The party reminds us that the better involvement of the engineering-technical personnel in the economic and financial problems of production, must be correctly understood, as a great question of principle, in the same manner that the economist too must sufficiently know the technical and technological aspects of production. "In our country,"--Comrade Enver Hoxha teaches--"the technical and technological problems are not separated from the economic aspect, in the same way that the latter must never be seen as detached from the political, social, material and technical aspects, otherwise the danger of succumbing to technocratism and economism could be quite real." The economists and the economic sciences should speak up more about the directions of the development of the productive forces and or production in every link and unit of the economy, about the necessity and profitability of the projects which are planned, designed and built, of new lines and sections, about how reasonably and how scientifically based are the tasks of the plan, and so forth.

The party has worked with and will work more closely with the engineering-technical cadres, with the agronomists and with the other specialists of production, construction, transportation, so that they too can understand and solve these problems increasingly better in cooperation with you.

But this scientific session is being attended by economists, therefore I will touch upon some problems which have to do with the work of the economists and on the necessary improvements which must take place in their work.

We justly demand the cooperation of the economists with other specialists and vice versa. But the question arises: how is the cooperation between the economists themselves of various professions, between the economists in planning, finances, accounting, and statistics within the economic enterprise or the agricultural cooperative, at the district level and throughout the country? Of course, such a cooperation exists and there are results, and this is the general characteristic of our entire activity. But the question is how to further improve the work, how to better and more effectively use those great possibilities which have been created.

If we are confronted with cases when the planning branch or sector is considered decisive in drawing up and monitoring the execution of the plan, whereas the other branches and sectors, such as those of finance, work organization, of material-technical supply and others, do not show the same concern for these tasks, if the financial problems are considered to belong only to the finance and accounting branch, if the economists supply copious reports periodically but fail to use them themselves in managing the work of the enterprise and of the cooperatives, if the figures of the plan and those of finance and accounting are at variance, let alone when "maneuvers" are tried to, at all cost, achieve plan fulfillment in global terms, and in three figures, and so forth,--then these all show that we have to do here with breaches in the implementation of the single management of economic problems in the enterprises and cooperatives, we have to do with closed work practices which, instead of helping us, they divide the forces and harm the work. Here, too, we must seek the source of differences which exist in some cases between the economic and financial indicators, in planning and in execution, something which then leads to erroneous data, as happens sometimes, for example, with the fulfillment of the task reduction of cost and of net income, or with some other indicator, when the data issued by the plan branches do not coincide with those issued by the branches of finance and accounting.

Of course, this lack of coordination and cooperation between the various sides of economic management in some enterprises and cooperatives, is not only the result of the inadequate work of the economists. It is also fed by the unhealthy work method of quite a few managers in enterprises, cooperatives, districts, and even in central ministries. If the director of the enterprise, the chairman of the cooperative or any other manager will continue to manage with a chain in hand, or by appeals and aimless running here and there, then he does not feel the need for the levers and organisms of our administration, nor for the information and the data which they glean. Whereas a true manager must thoroughly and daily request from you, the economists and other specialists (and it is your duty, too, to glean data), as to how the plan fulfillment is proceeding, how the distribution of products is proceeding, how the supply activity is proceeding,

how the norms of work and of materials are being realized and so forth. All these must be provided daily to the manager. In addition, according to established rules, every 10 days and at the end of every month, other data must be provided, for example about cost, productivity, income, the effectiveness of expenditures and so forth. In this way, one passes from general to concrete management, with pencil in hand, in level-headed and not aimless management. This will also improve the role of operational, statistical and accounting records, as very important factors for the scientific management of production. And here we are not talking about a stale accounting which is carried out just to be in order with the superior organs and then remains in the desk drawer. Comrade Enver Hoxha reminds us to tackle seriously the perfection of record-keeping, without drowning it with unnecessary things and without placing it in a dead-end street, but to have more complete presentation of a realistic and on schedule of the economic-financial situation of the enterprise, of the cooperative, of every institution and work center.

The party Central Committee and Comrade Enver Hoxha have criticized the basic party organizations for not sufficiently occupying themselves with economic and financial problems, and have asked them to get more deeply involved and to treat these problems better within the framework of the entire work and struggle which is carried out for the fulfillment of the plan tasks. But on which issues should the bureaus and the basic organization be informed and with which problems should they get involved more and better? Of course, it is up to them to concern themselves with and to assess these problems. But it is also the task of the economists of the planning, finance, accounting, and statistics factors to try a little bit harder and to get more involved so that, without burdening the party organs and organizations with unnecessary information and data, they will provide them on schedule with data regarding crucial problems, regarding the most important and most disturbing ones, and so they will know and monitor, better than heretofore, not only how the plan is realized in global terms, but also the quality, how the basic resources and materials are used, how much should be spent and how much has been spent to complete a job or a product, whether the finished product has reached its destination or not, and so forth.

It is a positive fact that many cadres and specialists are familiar with the data on the principal indicators of production. But to know the data in general terms is one thing and to discover what they stand for is another thing. Each figure is related to another, and each one has a reason, has a justification, with its own problems. For example, the cost is reduced but the net income of the society is not realized. Why does this happen? The wage fund is not met as a whole, but the average wage is over-fulfilled and at the same time labor productivity is realized. What are the reasons for this? The investment plan is fulfilled but not its financing. Where did the enterprise find the financial means to meet the expenses? And in order to provide an answer to these questions it is not enough to provide only a few stale data, but some explanation and conclusion is also necessary, and suggestions must be made for a solution, and so forth.

The party leads the life of the entire country. But for the management and development of the economy and culture, the party has its own levers, such as the state and economic organs and other organizations, employing a broad army of managers and economic specialists which it has trained. Therefore, you comrades must get more involved in the role and the great responsibility which you have. You should seek help from the party and the working masses, but you must also be accountable and answerable to them. You are familiar with the objective economic laws of socialism, the directives and the decisions of the party. They are reflected also in the state laws and ordinances, in the daily norms for circulating assets, in the norm of accumulation and productivity, in contractual relations. We maintain, even for simple things, detailed rules. There are, nevertheless, cases of violation of planning and financial discipline, careless and indifferent attitudes in the use and administration of socialist property, acts of negligence, including cases of violations of laws.

Somewhere, the quality of products breaks down and is damaged, and rejects are produced. In these places, however, in addition to the technologist we have also the economist who calculates and controls the work, we have also the accountant who calculates and controls the wage, and in order not to permit the marketing of such products, we also have over 3,000 people who are charged with the control of the quality of goods. But then, why are goods of poor quality produced? Somewhere, goods are produced without destination, which remain in storage, somewhere the goods are shipped to their destination, but are not accepted by the receiver, somewhere the goods are accepted and are used, but the bills are not paid, and so forth. And where such practices occur, we have economists, financial experts and accountants. Then, who acts this way and who permits such behavior? Somewhere, the goods are produced according to plan and in accordance with the standards and technical conditions, but still, someone is supplied with these goods above the plan and others below the plan, and still others, entirely outside the plan. Or investments are carried out and their financing is not on a par with the volume of works actually realized, or expenses above the plan or "expected" level are incurred, there is a lag in the work schedule, farm crops are not provided with fertilizers according to the plan and another farm crop is supplied above the plan, and so forth. How and why do these things happen, who acts in this manner, and why do the economists, the financial experts and the accountants permit them?

We have, in every enterprise, a planning branch, finance branch, supply and distribution branch, production branch and in every district we have planning and finance sections in the executive committee of the people's councils of the district, we have branches of the State Bank and of the Agricultural Bank, we have 17,000 high and middle-level economists. Where is their active role, their controlling role? It is their duty not only to ascertain these manifestations, but also to prevent them as soon as they are manifested and to stop them when they happen. "The planners and the financial experts in the enterprises and agricultural cooperatives,--reminds Comrade Enver Hoxha,--must not act simply as monitors, but they should turn

into unbreakable barricades against all violations of laws and of planned norms, by monitoring their expenses up to their final destination."

Of importance is to understand that none of us, the cadres and the specialists whom the party has trained, can escape part of the responsibility for the shortcomings and weaknesses evident in some economic enterprises or agricultural cooperatives. If the issues are understood this way, then, in the future, we will have four problems on this issue. Consequently, we will expect more from ourselves, we will provide greater help, and a stop will be put to violations and to damage to socialist property. As the people's saying goes, the wrong-doers and dishonest people try to fish in troubled waters, precisely where there is lack of order and control. The establishment of order and of firm control throughout and over the work of everyone, is what we need. We have no need to know the economic laws in terms of slogans, and in schools, too, they should not be taught to the pupils and to the students in a scholastic manner, but they must be closely related to our economic and social life and in the service of its progress.

The improvement of the scientific level of the management of economy makes the proper and daily monitoring of the economic issues a necessity. This alone, however, is not enough. The daily and operational work can never be effective and far-sighted if it is not based on actual and long-term, special and complex studies. "Our perspective,--teaches us Comrade Enver Hoxha,--is the complete construction of socialism and communism," therefore, "we must never proceed thoughtlessly, blindly, without weighing the possibilities and without setting clear objectives for the present and for the future."

Everywhere, in all fields, there are many problems to be studied. But it is also of importance, however, to decide which problem to tackle first, where to concentrate the main energies, with whom to cooperate in completing the study and from which point of view to analyze it and to study it, so as not to take a partial stand, but to view it in its complexity, from the economic, political, ideological, social, technical and organizational aspect.

It is known that the long-range development of our economy is realized on the basis of 5-year and long-term plans. The party Central Committee and the council of ministers, prior to issuing the guidelines to draw up the new draft five-year plan, made a series of studies. However, has the same practice been followed also in the districts, enterprises and agricultural cooperatives? Because it is true that the draft plan is already being drawn up, but we all know that study and preparatory work should have been carried out on time in order for this study work to precede the drafting of the plan on increasingly scientific bases. I stress this because of a lack of this type of work in the past, there have been cases where, as soon as a new enterprise has been set up or a reconstruction has taken place, additions or other changes have been sought, which if they had been properly foreseen, on the basis of a clearer prospective, could have been carried out, and considerable investment funds could have been saved.

On the basis of the guidelines of the party Central Committee and of the government, over four-fifths of the increase of industrial production in the coming 5-year period will be obtained from the existing enterprises, by better exploiting their productive capacities and by carrying out important reconstructions. In the agricultural cooperatives, a labor force of about 25,000 people will be added each year. How will these tasks be realized and how will these problems be solved? Precisely for this reason, every enterprise and agricultural cooperative must make studies for the long-term development, even for longer periods than 5 years. Prognoses and plans with real possibilities for implementation are imperative also for the districts and for various branches and sectors of the economy.

The problems of effectiveness are among the most sensitive problems of the economy, are broad and not easy to solve. Therefore, the studies must play a greater role in this field, and not only economic studies, but also studies in other fields. Greater attention must be paid to the effectiveness of production expenses and capital investments, in the entire study and planning work for the fulfillment of the programs of the deepening of the technical-scientific revolution. The object of special attention must be the enterprises and production activities which operate with losses or are subsidized, so as to lead them out of this situation, but without reducing the attention to the other enterprises and activities, which, although profitable, have and create reserves which must be discovered and utilized in raising their effectiveness. Such internal reserves are hidden behind inflated or outdated costs and budget allocations, behind irregularities observed in some cases in the administration and in the use of material, monetary and manpower assets, behind the fulfillment in global terms of the plan tasks and so forth.

When we speak of the problems of effectiveness, a problem which in this scientific session was correctly treated, it means that it should be seen as closely connected with the tasks for the continuous increase of production, because as the party stipulates, and you surely understand it this way, the effectiveness of the economy is based on the growth of production, on the fulfillment of plans, on the increase of labor productivity and on the reduction of the cost of production and of turnover expenses.

Therefore, we must always treat effectiveness on the basis of the economic policy of the party, by having as a basis the increase of production, the fulfillment of our plans. But, at the same time, we must calculate the amount of expenses to produce this or that commodity. We do not have and should not have obstacles along the paths of increasing production. In order to increase the planned production in agriculture, the labor and the specified materials must be used according to plan. We must not "conserve" them, as some people think and do, by not using them. The problem is to use them fully and on scientific bases, so as to increase the productivity per hectare and to increase production, because, in this manner, effectiveness also increases. This is the duty of all,

therefore yours, too, as economists, so that, where you work or away from your work, you will fight and help with all your strength to find and suggest various ways to increase production. However, when we are talking about effectiveness, we must keep well in mind the fact that in our economy a fixed price policy is practiced, which for some products creates the impression that allegedly they are unprofitable, but, in fact, this is not the case. Take, for example, the price policy of the party regarding children's wear, for some consumer goods, of for the assessment of a part of the means of production, and so forth. Even if production in some hilly and mountain zones may lack great effectiveness, we will and must continue increasing production in these zones too. The effectiveness must also be seen closely related to the necessity of securing a number of products locally and not simply according to their profitability.

We will continue reducing expenses for the production of poultry and pork and for the production of cotton, but this will occur while increasing production, surely, in the first place, while increasing yields. If we obtain 20 quintals per hectare of cotton, as is the case with the Lapardhase agricultural cooperative, or even 16 quintals per hectare, as is the case at the district level in Berat, instead of 11 quintals per hectare which was obtained last year on the national level, or 9 quintals per hectare in Durres District, then the production of this crop would surely be quite profitable. We could say the same thing also for the profitability of the production of pork, that is, if 10 quintals of pork can be obtained from every hog, or more, as is the case with the Roskoveci agricultural enterprise, and not only 2.5-3 quintals, as is the case with some agricultural cooperatives.

Of course, in the better results which we mentioned in the above two examples, the harmonized use of all the factors of the increase of productivity and production have had an influence; these factors are not necessarily the same everywhere, therefore it is also necessary to assess their level in the enterprises, cooperatives and other districts and what and how much can be done to create and mobilize these factors in a harmonized manner. But, if we are confronted with situations like that of the shoe plant in Korce which produces at a much lower cost than the other shoe factories, or the glass factory in Tirana which has fewer rejects and a lower cost than the other two glass factories, or if we are confronted with other examples of this nature mentioned during this session, then there should be no reluctance or delay in disseminating these positive experiences to other enterprises of the same kind. A positive role would be played here by the unified planning of the production and economic-financial indicators on part of the responsible ministries, by using as a basis the indicators of the progressive enterprises. It is necessary to make this one of the daily tasks of the central ministries, so that in the enterprises of the same type of production, when the conditions and the structure of production do not differ, they can find the ways for the most progressive experience to be carried out, of course by the others also, by unifying the production indicators during the planning stage.

When we talk about the conditions of production we have in mind among other things and above all, the technical and technological conditions. In order to increase the effectiveness, it is necessary to pay proper attention to the realization of the improvements in these directions. It is a fact that these, and, in particular technology, are not on the same level everywhere. There are some enterprises which use a more progressive technology than the others. The question is for this technology to be acquired and to be applied as soon as possible by the other enterprises which produce similar goods in the most varied and suitable ways possible. This should be kept in mind now during the drawing up of the draft 5-year plan, in particular for the reconstructions and new constructions which will be planned, by rigorously preventing expansion and reconstructions and new constructions based on a backward technology, as has been the case on certain occasions in the past.

A greater number of studies are necessary for the increase of the effectiveness of production, of investments and of expenses. Also for the quantity and quality of the performed work, for the techniques and technology which are used, for the effective and more complete utilization of the production capacities, for the effectiveness of the material expenses of production, of turnover, and so forth. The question is for us to make good calculations in all these fields, as Comrade Enver Hoxha teaches us, "with pencil in hand, preferably with a sharpened one." These and other problems which are related to the increase of economic effectiveness express basically, among other things, that fundamental demand which Comrade Enver Hoxha makes in his speech about the pre-draft 5-year plan, namely that before we think about where we will assign the various funds, we must think about the securing of the resources of accumulation and of foreign currency, because "Only in this manner will we march and continue to march with confidence, by setting first the head and then the feet."

The Seventh plenum of the Party Central Committee stressed that one of the crucial links for solving current and long-term problems is also the further perfection of the various aspects of the managing and organizational work of all the organs and organizations at the center and the base. Surely, there are a number of questions which the party has clarified, but I wanted to stress some problems which deserve to be viewed and studied with care. Thus, for example, are all the organizational structures of economic enterprises and of agricultural cooperatives in order everywhere, are the problems of concentration, of specialization and cooperation studied and solved properly within and without, and do problems rise in the field of competences? Or, in which directions should planning, study and use of new scientific methods in planning be further perfected, and record-keeping and accounting, of information and of statistics be improved, to simplify, and supplement them and to make them more accurate, making them more comprehensible for the cadres and the masses? Is it proper that, with the setting up of the Agricultural Bank, the sections of finance attached to the executive committees of the people's councils of the districts, should sometimes not occupy themselves with problems of agriculture? Or is it proper that in some districts the sections of finance and of control should

work together, that the planning branch of the agricultural cooperatives and in some economic enterprises also concerns itself with problems of supply and distribution, and that these matters take up 60-70 percent of the time.

The questions of the distribution of the social product and especially of the product itself, constitute a wide field of studies. Today we distribute, on the basis of the principle of compensation according to work, billions of lek. The question is that wages should be paid for work and sweat, not for working 6-7 hours per day, but 8 hours and with high productivity, so that wages are received always for useful products and services, and not to create jobs and to produce the kind of goods simply to justify the wage. The guideline issued for 1985 which calls for work norms to cover 95 percent of the work processes, and in the case of technical norms, no less than 75-80 percent of the work time with norms, make it necessary to better organize the work in this field.

The covering of the buying power of the population with goods and the necessary services, is an essential condition for the ever better satisfaction of its needs and for the speedy turnover of goods and of currency. Studies are made in the districts about the buying power, and a host of data and facts are issued in this connection, but, at times, they are inconsistent, and full and correct conclusions are not always drawn.

Problems to be studied may also be found in regard to the prices which are established for some type of commodity or product. But who can raise these problems before the competent organs better than you? The studies and the concrete proposals in these directions must be based strictly on party policy and on the pursuit of the problems according to the dynamics of life.

We must be aware that the problems of distribution are not resolved easily and by themselves. In order to solve them correctly and well, it is necessary to have scientific studies and planning, and confrontation, too, with foreign manifestations, and to wage a class struggle on the economic front. Therefore, the economists, no matter where they work, should fight with greater determination for the implementation of the party policy, they must become a barricade against all those who try to violate the laws and the rules of the state, who want to receive more than they give to the society, and so forth.

These are but some of the directions where research and study work can and must be directed, only to have an idea about the scope, the depth and the acuteness of the problems which require study and optimal solutions, as well as about the method of the management and study work in the field of the economy. The economy, in the dynamics of its development, entails, continually, a host of problems which have to do with the development of production forces in industry and agriculture, in construction and transportation, with the procurement of the accumulation of resources, with the increase of the export of goods, with the perfection of relations of ownership, of trade and distribution in the city and village, with

the strengthening of the cooperativist economy, with the narrowing of the differences between the village and the city, with the ways to increase the well-being of the people, and so forth.

These and others are problems which must be reflected in the tasks of the Seventh Five-Year Plan and which require a better concentration of attention and concern of all the economists.

The general characteristics of our economy are its successes, development at high rates, stability and clear prospects. It is the duty of all to see that, under the party leadership, with Comrade Enver Hoxha at the head, these characteristics of our economy, which constitute the principal front of socialist construction, are further strengthened and are always led forward, in the interest of the construction and defense of socialism in our country.

CPCZ OFFICIAL GIVES DETAILS ON NOMENKLATURA CADRES EVALUATION

Brno ROVNOST in Czech 19 Aug 80 p 4

[Article by Jaroslav Bunata, director of the Personnel Section of the CPCZ Regional Committee: "Prior to Comprehensive Cadre Evaluation"]

[Text] "In view of the growing tasks of economic development and social evolution," emphasized Comrade Gustav Husak in his speech at the 15th party congress, "we must significantly increase, in the near future, demands on the political and professional maturity and preparedness of managerial personnel, on their moral excellence, and on their ability to lead a collective, to creatively develop, and to consistently carry out party policy in the real world, in the sector entrusted to them. This requires the regular and rigorous evaluation of managers according to the results which they achieve in their work, to pay attention to their growth, and to provide them with aid and support."

As a component of an examination of the fulfillment of the congress conclusions and resolutions of the CPCZ Central Committee, the Presidium of the party Central Committee decided in its discussions in April of this year on the conduct of a comprehensive evaluation of the nomenklatura cadres of party agencies in 1980-81. Its goal is an evaluation of the role of managerial personnel in the fulfillment of the conclusions of party agency discussions and the objectives of the Sixth Five-Year Plan, as well as the further improvement of cadre training, the more effective assignment of people to specific management levels, but especially the guaranteeing of the tasks of the Seventh Five-Year Plan. It was decided to conduct the evaluation in two stages, in the interest of the unified conduct of the comprehensive evaluation of the nomenklatura cadres of party agencies, and increasing its role in the system of work with cadres.

The resolution of the CPCZ Central Committee Presidium providing for implementation of the comprehensive evaluation, and assuring its political organization in the South Moravia Region, where the Presidium of the regional party committee approved it in June of this year, stem from the experiences of party, federal, and economic agencies from its conduct to date. The existing system of a regularly conducted comprehensive evaluation is, as experience shows, one of the means which assist in the development of cadre work, in the improvement of the performance of managerial personnel. In spite of the overall positive contribution of the comprehensive cadre

evaluation, it is possible to say that certain shortcomings have also persisted in its practical conduct. The substance of these has been, above all, that the evaluation has not always been perceived as an inseparable component of efforts directed at an increase in the level of the administrative activities of management personnel, that matters have led to an overestimation of the formal aspects of the evaluation, to the concentration of the evaluation into a relatively small time period, to its extension even to line workers, and especially that the method of critical rigor has not become the generally accepted criterion for the judgment of cadre work.

The starting point for the organization of the comprehensive evaluation this year and next will be the Principles for Implementing Comprehensive Cadre Evaluation in State and Economic Administration, which were approved by the CPCZ Central Committee Presidium in January 1972, and which are still in force. These principles have been revised in past years in detail by relevant state and economic agencies and organizations to conform with their particular conditions, and have been implemented in day to day operations with lesser and greater degrees of success.

In addition to the temporal division of the comprehensive evaluation into two stages, there are two additional new aspects in comparison with previous practice:

--In 1980-81 the comprehensive evaluation will be carried out only on nomenklatura cadres of party agencies, i.e. on those managers whose function is included in the cadre organization of central, regional, district, enterprise, all factory, city, and local party committees and in the directory of functions of the fundamental CPCZ organizations in production, transport, and commercial factories and enterprises;

--In 1980-81 the comprehensive evaluation will be conducted strictly according to functional hierarchy, i.e. from the top down along a direct management axis (in a region, for instance: the general director--enterprise director--factory manager; similarly as well in other sectors of activity).

An unambiguous and permanent requirement for all party agencies and organizations in the region is that a rational approach be applied both to the preparation and the conduct of the comprehensive evaluation, and that all forms of unnecessary administrative activity be reduced. All efforts will be concentrated on the content side of the evaluation, and on private, frank personal conversation with management personnel of specific management levels. At the same time it will always be necessary to judge objectively the implementation primarily of the conclusions of the 14th and 15th sessions of the CPCZ Central Committee, but also those of regional or district party agencies which have been directed to specific sectors of activity in the federal and economic spheres.

The principled cadre policy of our party demands the objective and just evaluation of people. Being able to evaluate people means above all to know their abilities and talents, to place them in those positions and in those functions in which they will be the most useful for society. This year and next the comprehensive evaluation will be an instrument for inspecting the work of specific managerial personnel with the expectation that it must lead as well to the imposition of greater responsibility for given tasks. Practice shows that without systematic supervision certain good managerial personnel begin to be lax in their activities, fall into self-satisfaction and mediocrity, and then, logically, come to tolerate shortcomings even at the workplaces which they manage.

Experiences of party agencies and organizations from all of the previously conducted comprehensive evaluations in past years confirm the need for constantly and comprehensively evaluating the preparedness, commitment to work, political participation, and especially the achieved results of cadre activities. But findings also caution us that there is not always a full understanding of the importance of a comprehensive evaluation as a supervisory instrument given the simultaneous increase of demands on cadres, because a number of people feel, as it is said, offended. But life unambiguously shows that a capable, honest, and responsible manager cannot be offended, because just and objective evaluation of good managerial personnel only reinforces their authority and importance. After all, it is impossible not to see that differing results in the implementation of party policy exist and continue to persist among individual enterprises, factories, cooperatives, research institutes--simply put, in specific sectors of activity.

The difficulty and complexity of the management of political, economic, and social processes in the building of a developed socialist society necessarily raises the demands for the sophistication and quality of cadres in all areas of life. The objectives of the contemporary period can be mastered only by those people who have the necessary knowledge and wisdom, who have a well rounded political and professional preparation, and who are capable of executing party policy in the sectors entrusted to them.

Connected with this, for example, is also the necessity to comprehend fully that the Set of Measures for Improving the Planned Management System of the National Economy After 1980, as a plausible path to the overcoming of the difficulties being faced now by our economy, also means greater demands on cadre sophistication. We must always and everywhere recognize that not even the most perfect instruments for the resolution of social processes can be omnipotent. People are always the decisive factor. For management this means the managerial personnel at specific levels: how they understand the basis of the new requirements, and how consistently they begin to resolve work in the sector entrusted to them. Not only the conceptualization, but the efficient organization and smooth flow of production, order and discipline; the creation of a proper atmosphere for quality completed work and its just evaluation according to the merits of specific collectives and

workers--all this depends above all on the supervisory staffs of general directorates, enterprises, factories, cooperatives and other organizations.

The course and results of the current evaluation have only confirmed the correctness of the practice of establishing concrete goals and requirements for each stage in accordance with the main objectives of party work. Regional and all district party committees in the region have mounted impressive efforts for the timely and thorough preparation of the comprehensive evaluation for this year and next. An example of this is the thrashing out of the sense and goals of the prepared comprehensive evaluation at seminars of the chairmen of fundamental party organizations, meetings and discussion groups with the chairmen of all factory CPCZ committees and the managerial personnel of economic and federal agencies at which a unified approach within the framework of the whole regional party organization was at the same time agreed upon.

The imposition of the conclusions of party agency discussions, the orientation toward the qualitative aspects of social development, depends to a great extent on the sophistication of managerial personnel. It is then only logical that the emphasis of the comprehensive cadre evaluation will be greater demands on work results and the personal responsibility of managerial workers for the meeting of objectives and the imposition of societywide interests in the sector entrusted to them. At the present time it is necessary to support unambiguously such qualities of managerial cadres as the ability to organize the work of people, consistency in the elimination of shortcomings and disorder at workplaces, full application of devotion to the party, and professionalism in the management of their sectors. It is well known to the whole broad group of devoted party members that these are not completely new and unfamiliar requirements. But as the practice and experiences of party organs and organizations indicate, they remain very topical and pressing.

The party values committed, honest, and diligent people. In all its activities it creates the prerequisites so that they may have the possibility to obtain ever greater political and professional knowledge, and supports them with all its authority. With the comprehensive evaluations it stimulates them to additional growth, to political and professional education, to an increase in their role in the implementation of the economic and social program of the party. The fulfillment of the objectives which stand before us today will become a verification of the level of the managerial work of party, federal, and economic agencies. This first of all concerns the meeting of the objectives of the final year of the Sixth Five-Year Plan, the preparation of the plan for 1981 and the whole Seventh Five-Year Plan, and the conduct of the comprehensive evaluation of nomenklatura cadres of party agencies this year and next.

ARMED FORCES POLITICAL ADMINISTRATOR ON WARSAW PACT MANEUVERS

East Berlin HORIZONT in German Vol 13 No 35, 1980 signed to press 25 Aug 80 pp 8-9

[Article by Lt Gen Ernst Hampf, deputy chief, Political Main Administration, National People's Army (NVA): "Supreme Goal of Socialist Comradeship-in-Arms--Determined Defense of Peace; 'Comradeship-in-Arms 80'--Maneuvers in the Service of Peace; Salutary Demonstrations of Unity and Cohesiveness; Military Mission: No Chances for the Aggressor: Solid Front Against Imperialist Course of Confrontation; Comradeship-in-Arms--Decisive Factor of Combat Strength"] -- Passages within slantlines in bold face]

[Text] At the session of the Political Advisory Committee of member states of the Warsaw Pact on 14 and 15 May 1980 in Warsaw, the fraternal nations struck a balance of the 25 years of existence of their defense alliance in the service of peace. Their declaration reads: "Whatever side one may take in the relations between nations, the Warsaw Pact states have always fought in the forefront for peace, detente and international cooperation... .

"But as long as the NATO bloc exists and continues to enlarge its military potential in the effort to gain military superiority, the Warsaw Pact nations will take all measures necessary in order to maintain its defense force at the necessary level."

This is a clear and decisive word, and we accept it. It reflects the intrinsic humanism and the essence of the foreign, security and military policies of the Warsaw Pact states.

Also in the service of peace will be the "Comradeship-in-Arms 80" maneuvers, which will take place during the first half of September of GDR territory.

Participating will be troops of the Bulgarian and Hungarian armies, the GDR's NVA, of the Polish and Romanian strike forces, of the Soviet army and the Czechoslovak army, as well as units of the united Baltic fleets. In these maneuvers, the united strike forces of the Warsaw Pact states will prove their increased military strength and their unity in political and military actions.

NATO Confrontation Strategy Getting the Appropriate Rebuff

Gen Heinz Kessler, deputy minister and chief of the political main administration of the NVA, explained at the 12th Congress of the SED's Central Committee: "Joint maneuvers of the NVA, the Soviet army and other fraternal armies are...of great military importance, because they document on the battlefield that the alliance of our parties, peoples and armies is invincible. They demonstrate the strength and power of the socialist international military organization and give the warmongers in NATO the clear message: We are prepared to defend peace and socialism with dedication and reliability."

"Comradeship-in-Arms 80" will show the world that peace and socialism are reliably protected. This is especially important at a time of increased international tensions. Everyone--be it friend or foe--should know that the policies of the socialist community of states, which strives for peace and social progress, also includes military measures which are necessary in order to rebuff the aggressive confrontation and power politics of imperialist circles. For that reason, the united strike forces of the socialist military coalition guarantee high combat strength and combat preparedness at all times.

Certain influential imperialist circles still have not reacted with positive measures to the great peace initiative of socialism for continued detente, for a stop to the arms race, for disarmament and for a future for mankind without the danger of a nuclear-missile war. They insist on their long-term aggressive strategy. Many facts prove this, among them especially the NATO long-range program, the Brussels missile resolution and the smear campaign against socialism which has been going on since the beginning of this year.

In view of NATO's aggressiveness and the dangerous international developments connected with it, sudden turns in the situation are possible at any time. Socialist nations take this into consideration. They keep their defense strength at the necessary level. Members of the NVA, under the leadership of the SED and at the side of the Soviet army and the other fraternal armies, make every effort to be prepared for defense against aggression on all sides.

With "Comradeship-in-Arms 80," the united forces of the Warsaw Pact will demonstrate that they are capable of successfully spoiling all variations of NATO confrontation strategy. Scare tactics are alien to socialism, socialism threatens no one. But in the 25-year history of the Warsaw Pact, it has always proven to be beneficial to demonstrate to the enemy the strength and cohesiveness of the socialist military coalition at the proper time.

The Peace Policy of Socialism Demands High Defense Capability

Erich Honecker, secretary general of the SED's Central Committee, warned at the 12th plenary session: "When peace is threateneed, it becomes a duty to fight even harder for its guarantee."

This is in accordance with the line decided upon by the Political Advisory Committee of the Warsaw Pact Organization: The countries of the socialist community continue their peace policy with persistence. Nor will they allow any military superiority of the NATO bloc. Leading representatives of the Warsaw Pact nations are appealing to the peoples and the governments of Europe and the world to do everything in order to solidify peace and to strongly oppose those whose dangerous arms-race and confrontation policies bring incalculable dangers to all mankind; the seven-point Warsaw action program clarifies this.

/The fight of the socialist nations to remove the danger of war has only one choice in the present situation of the class struggle between socialism and imperialism: to pursue a dialectical unity with measures which allow socialist defense capability to stay on top of its mission./ "Comradeship-in Arms 80" will be a practical example of the fact that this Marxist-Leninist realization is absolute and is finding its logical expression. The united strike forces are ready and capable of fulfilling their joint military class mission for the protection of peace and socialism. Therefore, the motto of this maneuver is: "Comrades-in-Arms--united for peace and socialism--no chance for the enemy!" This is the goal and the great political significance, not only of the maneuver, but also of any additional efforts of the joint military actions of the socialist armies.

Socialist Defense of Country--A Coalition

The fundamental concern of the military policy of the Warsaw Pact nations is the defense of peace, socialism and communism. Thus they wage a decisive battle for the vital interests of all peace-loving mankind. It is up to the united strike forces to guarantee an always high combat readiness in solid comradeship-in-class and comradeship-in-arms, to meet any and all provocations of the class enemy at all times, and to reliably protect the socialist fatherland. This is their contribution in the international class struggle.

Military service in socialism is a just and deeply revolutionary mission. It can be guaranteed only in close, always strengthening comradeship-in-arms with the Soviet army and the other allied armies. With "Comradeship-in-Arms 80" we emphasize the military protection of socialism and the defense of world peace is possible in the solid community of the fraternal nations. Guarantee for the victoriousness of socialism and communism and of its secure military protection, is the leadership by the fraternally united Marxist-Leninist parties, is the solid alliance with the Soviet Union as the main force behind the socialist community of states.

Socialist defense has become more important than just the concern of one nation. It has a new dimension, it has the character of a coalition and its responsibility has increased tremendously. This is becoming clear as

never before at the beginning of the 1980's, as mankind faces decisions on which the peace of the future depends. Peace is at stake. Also at stake are the protection of the progressive social order which determines the development of the revolutionary world process more and more. Also at stake is the reliable support of the nations fighting for national and social liberation. For that reason the Warsaw Pact presents to the imperialist nations a forceful, consistent front--politically, economically and militarily.

This presents itself as a historical necessity growing out of the socialist revolution, out of the character of the epoche.

/Member nations of the Warsaw Pact have a uniform military strategic target: the collective defense of peace and of the accomplishments of socialism./ They and their communist and worker parties conform in the effort to further consolidate and improve their political and military alliance in accordance with the principles of socialist internationalism. In this they see the guarantee for a successful fulfillment of their magnificent plans and programs. It is one of the permanent merits of our party to have made eternal friendship with the socialist brother nations, especially with the Soviet Union, the guideline of GDR policy. Members of the NVA are trained in this sense.

Comradeship-in-Arms--Emphasis in Ideological Education

The NVA is conscious of this great responsibility at the boundary between the two social systems, between the two military alliances in Europe. It is fulfilling its duty to the alliance, to the collective military protection of socialism loyally, on the basis of the resolutions of the Ninth SED Party Congress. Constant combat readiness and true comradeship-in-arms are for members of the NVA the decisive criteria for the realization of the military class mission decided on by the Ninth SED Party Congress. This is their most important contribution to a worthy preparation for the 10th SED Party Congress.

It is obvious that the missions and activities of the NVA as part of the coalition place high demands on all members of the army in every respect. For that reason, we strive in political training in the NVA for a qualitative increase in socialist patriotism and proletarian internationalism, which are realized in the solid comradeship-in-arms with our fraternal armies.

Superiors, party and FDJ organizations emphasize the following points in order to solidify comradeship-in-arms:

1. They explain to members of the military the meaning, the character of socialist internationalism, make it conscious and create a love for it. In accordance with the demands of the SED party program, with patriotic and internationalistic education, they are shown both in theory and in practice that the relations of the fraternal socialist nations are based on unshakable foundations: sharing the great cause of socialism and communism, the

common ideas of Marxism-Leninism, the political unity of the parties, the involvement of their economies, the closely coordinated foreign policy, the cultural ties, the vital relations between the workers of our nations.

2. The realization that the Soviet Union is doing enormous pioneer work for social progress is deepened in members of the armed forces. Erich Honecker stated at the 12th plenary session: "Thirty-five years ago, the Soviet Union brought liberation to the people through its victory over Hitler fascism, and introduced the longest period of peace in Europe in this century. Today it also shows itself as the most powerful and the most influential champion of a peaceful world. It is the center of our alliance in the Warsaw Pact."

The GDR, our socialist fatherland, would be unthinkable without the Soviet Union! For that reason, as Gen Heinz Hoffmann emphasized in MILITAERWESEN, "the patriot and internationalist is measured according to his attitude to the Soviet Union and to its armed forces. We want to, and shall in future also, be among those who do so precisely." True to the legacy of Ernst Thaelmann, we will in future also consider our attitude to Lenin's country and to the comradeship-in-arms with the Soviet army, which has already become dear to us, as the political foundation of communist thinking and acting, of the entire spiritual life in our army, and always act accordingly.

3. Comradeship-in-arms influences all military life deciseively. For the sake of unity between word and deed, optimal conditions are created everywhere so that comradeship-in-arms can prove itself and be solidified on the battlefield and in combat training. With the Soviet army's creative transposition of training principles and standards in the most important branches of training, possibilities to organize joint training measures, especially with those Soviet units stationed in the GDR, to have an immediate exchange of experience, to utilize training bases more effectively and to make direct comparisons of the accomplishments, are given.

4. Commanders, leaders, party and mass organizations have close contacts with the "next regiment." The great and glorious experience of the Soviet army in class education, in the political and moral, physical and psychological preparation for combat, the Soviet military know-how in preparation for carrying out combat training or in developing new principles of leadership are an invaluable help to us in political and military education and training.

5. The expansion and strengthening of military technical cooperation plays an important part in strengthening relations to the comrades-in-arms. The NVA, like all Warsaw Pact armies, is equipped with modern combat technology, especially of Soviet construction. This uniformity in arms and equipment is an important factor of socialist military strength. In order to make it fully effective, in order to take the greatest advantage of modern technology, the comrades of all the individual armed forces, of all branches of service, of special troops and special services exchange experience with their parents.

6. Knowledge of Soviet military science is used intensively in the further strengthening of the comradeship-in-arms. Soviet military science discovers new military developments. An abundance of materials is available: military regulations, scientific books and articles. The memoirs and publications of renowned Soviet military leaders, soldiers and military historians have stirred up interest in members of our armed forces. They make an essential contribution to the development of socialist soldier personalities. The memoirs of L. I. Brezhnev receive special recognition. They are not in the traditional sense of the word, but rather contain the experiences of his entire life for the communist education of Soviet citizens, especially of youth. For example, the words from "The Small Land" have become an entire program for the political work in the NVA: "A real political worker in the army gathers people around himself, knows their moods, needs, hopes and dreams, leads them to self-sacrifice, to the heroic deed. And if one considers the fact that the fighting spirit of the troops is always called the most important factor of their steadfastness, then the political worker was in charge of the most important weapon during the years of the war. He steeled the spirit and heart of the warriors. Without that, neither tanks nor cannons nor planes would have brought us victory." The NVA always lets itself be guided by this high appreciation for the party workers and the political work in the armed forces.

Guarding the Peace with Discipline, with Initiative, without Compromise

Under these and other aspects, the political-ideological education in our army aims at absolute preparedness to fulfill the military class mission of the NVA, shoulder to shoulder with the Soviet comrades-in-arms and those of the other armies of the united strike forces. /Through the development of the socialist comradeship-in-arms, the enemy will again and again meet with the sobering truth: Socialism has strong, uniformly acting units./ The socialist armies have the best possible equipment for a possible military encounter which might be forced on them. They are trained thoroughly, hard and according to common principles. The soldiers of socialism together guard peace and socialism with discipline, initiative and without making compromises. They shall be victorious!

The "Comradeship-in-Arms 80" maneuver will testify to this. It emphasizes that the great socialist peace initiative of May of this year rests on a good military foundation, that it will ultimately meet with success. The "Comradeship-in-Arms 80" maneuvers are a real trial for the NVA. Through them the NVA will prove that it is fulfilling the military class mission given to it by the Ninth SED Party Congress, and becomes a part of our people's mass initiative kindled by the 12th plenary session of the Central Committee, under the watchword: "The best for the 10th SED Party Congress! Everything for the welfare of the people!"

IMPROVEMENTS NOTED IN SOLDIERS' LIVING CONDITIONS

East Berlin VOLKSARMEE in German No 21, 1980 signed to press 19 May 80 pp 4-5

[Article by Lt Gen Joachim Goldbach, deputy minister for national defense and chief, Rear Services: "Working and Living Conditions--Factors of Combat Readiness"]

[Text] The planned improvement of working and living conditions for members of the armed forces is an expression and permanent part of the successful realization of the course decided on by our party at the eighth and ninth party congresses.

Comrade Erich Honecker, secretary general of the SED Central Committee proved convincingly at the 11th session of the Central Committee as well as in his speech before the kreis first secretaries that the GDR's economic strength has grown since that time and that the working conditions and living conditions of our people have been improved considerably. This also applies to the NVA; the working and living conditions of members of the NVA is not only talked about and written about, but is treated and carried out as a high priority question.

And rightly so--because it is important to create, i.e., continue to improve the kind of conditions which enable our soldiers to at all times honorably fulfill the military class mission which they have received from the party of the worker class.

Socialism Does Not Exclude the Barracks

The motto typical for socialist politics--to do everything for the benefit and happiness of the working people--has dual significance for us in the armed forces. For one, as members of the armed forces of our socialist state we create significant prerequisites for the realization of our economic and social policy by carrying out our military class mission. As the National People's Army, we safeguard the peace with the indestructable comradeship-in-arms with the Soviet army and the other fraternal armies of the socialist community. With this we take part in guaranteeing the most important living conditions there are, because any additional successful development of our socialist fatherland depends primarily on the guarantee of peace and security.

Secondly, our policy's basic aim takes shape more and more from year to year, outside of the military. Our comrades feel ever more clearly that the often cited words: "Socialism does not exclude the barracks" are not spoken in vain. They are backed by solid social political measures and initiatives, from which each one can see our party's and our government's constant concern for the army.

The realization of the military class mission often means sacrifices and hardships for members of our army and its civilian employees. According to General Hoffmann, member of the Politburo of the Central Committee of the SED and minister of national defense of the GDR, this will also "remain this way in the future, as long as there are strong imperialist armies and fleets under arms--even if we succeed forever in securing a reliable peace."

The demand for preparedness every day, at every hour, to meet the class enemy in hard confrontation, is without a doubt very high. But it is for that reason that our party's mission to struggle persistently for improved working and living conditions for our soldiers is a personal obligation for every one of us. And we do not overlook the fact that improvements in working and living conditions alone do not bring about a socialist way of thinking or acting. Factors such as consciousness, creativity and initiative are developed and stabilized only if based on the totality of all the effects of our political-ideological, spiritual-cultural, military and material achievements.

The Military Class Mission Determines Our Thoughts and Actions

Whoever thinks of working and living conditions primarily in terms of leisure time activities, or whoever considers improvements as such only if more time or better food is available, will be dissatisfied and will feel misunderstood, because one must truly understand the character of our army and of its mission in order to effectively deal with the problems of improving working and living conditions. Our thoughts and actions are constantly determined by the military class mission, and everything serves its realization.

For that reason, it is the prime objective to pay attention to those factors of the entire complex of working and living conditions which are most important for the fulfillment of our mission.

We fulfill our responsibility by creating for our soldiers and the civilian employees of the military the kind of conditions which enable them to fulfill their tasks more efficiently. If one looks at the socialist soldier's everyday life--the environment in which our younger, but also the older soldiers live, are shaped and educated, then we can note that the needs of our comrades do not grow unilaterally, e.g., not only materially. When our soldiers carry out their military mission with great personal sacrifice, they have a right to see that their knowledge and ability, their deeds and their skills are utilized intelligently, and that their intellectual and physical strength is regenerated and increased in the socialist fashion.

New arms and complicated combat technology categorically require better combat training. But this can only be achieved through greater effectiveness, not through increased material expenditures. Successful experiences are created for our comrades only through more effective combat training, which both requires and leads to achievements. This also furthers a readiness for the fulfillment of daily duties to our socialist fatherland and the joy of serving which, combined with the significant factor of conscious military discipline and order forms a basic prerequisite for the continued development of living and working conditions. This even affects leisure time; it is not the purpose of leisure time to continue with an already difficult training day. Here, our comrades must have the opportunity to regenerate their strength and to relax with a meaningful activity.

Finding Pleasure in Work is also a Form of Combat Strength

Although the relationship between the two is recognized more and more, there are still elements influencing efforts to do away with unnecessary stress and unnecessarily high demands. For that reason, it is more important than ever to secure to a greater extent the complex interaction between high level combat training, a highly organized military life, socialist relations and improving working and living conditions. It is important that our soldiers fulfill their certainly not easy tasks happily, with initiative, and conscious of the fact that they are doing their best for a good cause. They should be able to work and live and fulfill their duties in a cultured environment and thus be able to bear up under great stress and deprivation. Seen in this light, the question of working and living conditions as factors of increasing combat strength and combat readiness gains ever more significance. It is indeed a fact that arms and technology alone, no matter how good, do not automatically produce combat strength and combat readiness. People, above all, with their readiness to achieve and to serve, with their initiative and creative urge--but also with their wishes, needs and individual desires--are a part of that.

Everyone should enjoy his service and its results and, under the most favorable conditions possible, be able to gain new strength for the successful fulfillment of his mission in the sense of a further increase of combat strength and combat readiness. And we do not overlook the fact that their demands for improved working and living conditions are not unchanging. As our society and its people develop, as demands increase, demands for working and living conditions also change. Experience has shown that once needs are fulfilled, new and greater needs arise. For that reason, the still popular slogan: "We did not have that when we were young," i.e., the past, cannot be the criterion for our efforts, but rather the present factor of increased combat strength and combat readiness. Problems of sharing quarters in military collectives and the relations between superiors and subordinates in their entire complexity are also part of this.

Ready to Go Through the Fire For His Comrades

Who would be enthusiastic if he could not live in harmony with his buddy, on whom he has to be able to depend completely in every situation, and who would go through fire for his buddy if he were not convinced that his comrade, in turn, would do the same for him!

Just as a good fraternal, socialist relationship between our soldiers is simply a part of our working and living conditions, iron discipline and order also influence this complex process. It is undisputed that whenever people relate in a matter-of-fact, reasonable manner, where people live together in an atmosphere of trust, mutual respect and discipline, tasks are solved quicker and better and success is greater. But this side of the problem, as well as all others concerning military life, is not simply a matter which concerns only superiors. That means it concerns everybody. Each individual must do his share in accordance with his capabilities and, as experience has shown, these capabilities are as varied as the demands, expectations and wishes concerning duty and life within the military as well as outside of it.

Success reached in recent years shows what joint efforts can do. It is an expression of our economy's greater potential, as a result of which our state has been able to make considerable improvements in working and living conditions, especially since the eighth and ninth party congresses. Every one of us is the beneficiary of such social-political measures, which find their expression in more money and more leisure time. We are happy about the increase in the number of vacation spots offered and about more effective medical care for members of our military. The residential building program will also affect us, and renovations as well as additional club facilities contribute to the well-being of our military and their families.

Changes are clearly noticeable even in other ways. The periodic modernization of our combat technology, the continuous perfection of training bases, the building of new housing, etc., are important steps in the improvement of working and living conditions leading to greater combat strength and combat readiness.

Of course there are many possibilities in organizing our joint efforts in the military as well as the social field more effectively, more rationally and better, primarily, of course, as concerns the fulfillment of our mission, and this concerns even the family. The growing attention given to this aspect is expressed by the Conference on the Family and the meetings of the minister of national defense and his deputies with young officers and their wives. How quickly and to what extent we take advantage of this potential and discover additional resources depends on the initiative and the devotion of all.

Rear Services--Means Half the Victory and More

Members of the Rear Services also strive to make their contribution to further improvements in the working and living conditions in accordance with all additional wishes which, without a doubt, still remain. They know just how much and what all depends on their work, and they understand the well-known words spoken by Soviet Marshal J. Ch. Bagramyan: "The Rear Services, that is half the victory and more" primarily as a call to duty.

Members of the Rear Services know that working and living conditions influence combat strength and combat readiness and affect immediate interests and needs, raising of awareness, devotion to duty, and capabilities of the soldiers. For that reason they attribute great importance to rear area security in all its aspects, including the further improvement in working and living conditions.

Preference cannot be given, because we need high-grade food service as well as medical service, we need timely supplies of fuel and lubricants, and even the issuing of uniforms in the proper size is important.

In all questions of supply appropriations, it is important to be thrifty with the material and financial means which have been gained by our workers in industry and agriculture, i.e., to achieve maximum results in military supplies. There can be no "either," meaning much money and good working and living conditions, and "or" (less money and less favorable conditions).

Just as in all other areas, our party urges us to achieve more with fewer means, to use the existing means sparingly and effectively and thus to achieve greater efficiency, when it comes to working and living conditions as well.

We are thus in agreement with the demands made by the eleventh conference of delegates of the SED party organizations in the NVA, which made it clear that it is primarily our aim to further familiarize members of our military and their civilian employees with the advantages of the socialist social order in military daily life. What is important is not more, but above all, better quality--to jointly look for effective changes and improvements and to realize these in joint effort.

POLITICAL COMMITTEE APPROVES RESOLUTION ON PARTY TRAINING

Budapest PARTELET in Hungarian No 9, Sep 80 pp 13-17

[Resolution of the MSZMP Political Committee on the Five-Year Plan of Party Education, adopted at the Political Committee's 22 July 1980 session]

> [Text] At its session on 22 July 1980, the Political Committee discussed and approved the intermediate-range plan of party education. We present the text of the resolution, in slightly abridged form.

The tasks of party education in recent years were set by the objectives of the 11th MSZMP Congress, and by the Central Committee's 26 October 1976 resolution on developing party propaganda.

Party education joined in the tasks confronting the party. It assigned high priority to investigating the lasting trends and new questions in the development of the socialist economy and of international relations. In cadre training, greater emphasis is being placed on studying the classics. Training in dialectic and historical materialistic thinking has shifted more to the forefront. Domestic and international experience is being used more widely. Demand has increased to compare theory with the experiences of political practice.

In party education, however, we still find that in many instances formalistic and rote-learning methods are used in teaching the concepts, categories and laws. This relegates to the background ideological-political education, formation of a Marxist-Leninist world outlook, and the militant nature of party education, detracting from its convincing force.

The forums that aid party education have become more effective. Lectures at the Political Academy have theoretically substantiated the current tasks and have comprehensively explained their political reasons. As a new form, the theoretical consultations presented the research results in the social sciences and the experience of practical work, enhancing their application in party propaganda. The Political College, the party press, the journal PROPAGANDISTA, and the publishing of political books aided party education more effectively.

The training and work of the propagandists have improved. The average level of their political training is higher, and they have gained political and practical experience. However, their training and further training lags behind the qualitative requirements of party education.

I. Substantive Tasks of Party Education

The basic task of party education in the coming years is to aid the realization of the resolutions adopted by the 12th MSZMP Congress. The evaluations and tasks formulated in the documents of the 12th party congress determine the content of work in education and training.

In the sequence of the congress resolution, party education must focus on the following ideological and political questions.

a. Principal characteristics of our socialist development:

Propaganda must start out from the fact that our party is continuing its decades-old proven policy even under the changing conditions of building socialism, and that it is striving to realize the objectives specified in the program declaration.

The tasks set in the congress resolution serve to consolidate the earlier achievements, and fulfillment of these tasks will result in further progress and a qualitative transformation in every area. The economic tasks demand even more forcefully than heretofore the development of our social, political, ideological and cultural conditions. The harmony between the economic foundation and superstructure of socialist society will continue to grow in the coming years, and their interaction will become more effective.

b. Our social-policy tasks:

Propaganda must point out the growing significance of socialist national unity, and the present tasks of strengthening this unity.

It should publicize the leading role of the working class and the importance of the socialist development and cooperation of all social classes and strata, from the viewpoint of reinforcing society's social traits and of realizing its objectives. It should devote more attention than up to now to the situation and role of the intelligentsia and youth.

Propaganda must explore comprehensively the significance of unfolding socialist democracy and the tasks of its further development. It must emphasize the role of socialist democracy in asserting the interests of society, in uncovering, reconciling and solving in a socialist manner any conflicts of interest. It must place great emphasis on presenting the forums of socialist democracy, on ensuring the conditions for their effective functioning. It must demonstrate the requirements for the proper functioning of the state organs and social organizations, and the tasks for developing their activities.

c. Development of the socialist economy:

Propaganda must devote close attention to the basic requirements for the socialist economy's development and the Sixth Five-Year Plan's fulfillment, and the tasks of intensive development. It must present comprehensively the strategy of our economic policy, the immediate and long-range tasks in conjunction with modernizing our production structure and product structure, and with restoring and improving economic equilibrium. It must publicize the functioning of socialism's productive forces, the lasting requirements of effectiveness, productivity, economization and manpower management.

In conjunction with the development of the productive forces, propaganda must present the possibilities provided by the socialist production conditions, the ways of realizing these possibilities, the conditions of ownership, the directions of their development and their social role. It must systematically investigate the requirements of conformity to the plan, the development of economic management, the role of commodity and money relations, and the tasks of enterprise management.

It must examine the effect that changes in the international economic conditions have on the Hungarian economy. In the light of these effects, it must evaluate the economy's results, possibilities and weaknesses, and the requirements of adjustment.

d. Living standard and social policy:

Propaganda must spread awareness of the close relationship between the economy's situation and results, and the improvement of living conditions. It must present the progress in raising the standard of living, and the importance of preserving this progress.

It must devote close attention to presenting the relationship between output on the one hand, and incomes and prices on the other. It must publicize the principles of socialist distribution, the economic effect and requirements of earnings commensurate with the work performed.

It must emphasize the role that social benefits play in the improvement of living conditions. It must explain the efforts to better adapt social benefits to social circumstances, so as to improve primarily the situation of the elderly, large families and newlyweds.

e. Ideological and cultural tasks:

Propaganda must point out that the factors of consciousness and socialist interpersonal relations are becoming increasingly important in our present stage of development, and that the ideological, political and moral requirements are becoming increasingly stricter. In this spirit it is essential to wage wider propaganda for the socialist education of the masses. Propaganda must demobstrate more clearly the unity of responsibility and

discipline, of rights and obligations. It must dwell comprehensively on the requirements of the socialist way of life, on forming the socialist content of work, public affairs and culture, on criticizing manifestations of petit-bourgeois views.

Ideological education must continue to devote close attention to the ideals and practice of socialist patriotism and proletarian internationalism, to spreading awareness of their relationship. It must be demonstrated convincingly that proper serving of national interests is inseparable from internationalism, just as promotion of the international cause of progress is inseparable from serving the interests of our country and people.

Propaganda must be more active in repressing the nationalistic, cosmopolitan and petit-bourgeois views that are ideologically harmful and conflict with our principles. It must combat more decisively manifestations of pseudo-leftist intolerance, demagoguery and revisionism. It must assume a greater role in overcoming the influence of an idealistic world outlook, in spreading a materialistic world outlook and dialectic thinking.

Propaganda must publicize the cultural objectives of our party, the tasks in conjunction with developing public education and culture, literature and the arts. It must take more closely into account the cultural level of the participants in party education, encourage the development of their cultural needs and aid the acceptance of socialist cultural values.

f. Development of party control and of party life:

Propaganda must help to strengthen the party's ideological, political and action unity.

Party education must spread awareness of the Leninist norms of party life, of the requirements of party democracy and communist work style, and of the tasks for developing them.

It must dwell on the requirements of the party's leading role, underscoring the timely tasks in conjunction with realizing the political objectives and strengthening relations with the masses. It must demonstrate comprehensively the role and tasks of the local party organizations.

g. International conditions of building socialism:

Propaganda on international issues must intensify recognition of the principal trends of international developments and must prove the decisive role of the socialist world system and of the Soviet Union. It must demonstrate the importance of the international communist and worker movement's unity and the characteristics of its development. It must explain the developing countries' role in world politics, and the social and economic causes of their differentiated development and orientation. It must unmask the strategy of imperialism, and the new features of its changing tactics.

It moust expound the political significance of peaceful coexistence in constructing socialism and preserving world peace, of the relationship between peaceful coexistence and the possibilities and tasks of social progress. It must unmask the imperilist efforts to increase world tension, and the anti-socialism and anti-peace policies of imperialism's allies, including the Chinese leaders.

II. Strengthening the Influence of Party Education, Development of Its System and Management

1. Qualitative improvement and greater influence of forming a Marxist-Leninist world outlook will remain the principal task of party education also during the next five years. Realization of the Central Committee's 26 October 1976 resolution must be continued.

To this end:

Party education must provide the foundation for the party members' Marxist-Leninist world outlook, for their understanding of the political objectives. It must help party members consciously identify with the new tasks in building socialism. It must transmit systematically and on a high level the mature results of research in the social sciences, and the proven experience of political and practical work.

Ideological training must strengthen the ideological and political staunchness and historical outlook of the participants in party education, and must make them more receptive to the new circumstances, tasks and solutions. Propaganda must enhance more-active support of party policy and of the public interest.

Party education must be brought closer to reality. The outlines, programs and curricula of its courses must better reflect the real situation and must dwell more specifically on the practice of building a socialist society and economy. It must spread awareness of the necessities and possibilities reflected in party policy, and of the increasing and changing requirements of building socialism.

In party education it is necessary to strengthen the role of debate that enhances independent thinking, and to develop the students' readiness and ability to engage in debate in the dissemination and defense of our principles, and to convincingly support our political and practical tasks. Party education must make further progress in strengthening its substantive and activist features. It must become a party-minded forum for debating ideological and political questions. Superficiality, and the perfunctory and rote-learning features of party education must be overcome.

Party education must be linked more closely with the party organizations' work of ideological and political training, and with the political and practical tasks that must be solved locally.

Generally speaking, enrollment in party education does not have to be increased, and emphasis must be placed on qualitative improvement.

2. The system of party education has basically proved suitable. In view of the increasing political and ideological requirements, however, partial changes are necessary.

a. The training of cadres must preserve the results achieved in recent years, and it must contribute to a greater extent toward broadening the participants' political interests, strengthening their commitment, and their more-active support of party policy. The outlines and curricula must enhance this.

The number of university extension courses must be reduced--by abolishing identical parallel courses--and the syllabi of the courses must be unified.

The extramural forms of the further training of cadres must be developed.

The circle of participants in independent study must be enlarged gradually; to this end the Budapest and megye party committees must devote increased attention to the selection and training of advisers;

To satisfy the special tasks and requirements of further training, the circles that study the works of the classics, present-day ideological and political literature, and the more important ideological and political questions must be revived, primarily for intellectuals.

b. The system of mass education must be adapted to the tasks that reinforce the political persuasiveness of the hundreds and thousands of party members and their ability to take action.

The central courses in mass education should cover fewer topics in the future, but the most important topics should be discussed in more sessions. The curricula should provide a better foundation for ideological training, and for the unfolding of political and practical activity.

To satisfy the everyday and local requirements of political work, the system of the Budapest and megye courses and lecture series, which are propagandistic but have more-flexible curricula, must be broadened.

c. The proposed changes in the system of party education, and the modernized outlines and curricula should be introduced in the 1981-1982 academic year. The time available should be used to significantly upgrade the curricula and to train propagandists.

In its 1980-1981 academic year, party education should cover the resolutions of the 12th party congress with revised study programs and curricula, but in the present system of courses.

3. Careful selection of propagandists and development of their training and further training are a basic prerequisite for a further improvement in

the quality of instruction. More party workers and leaders who have the necessary theoretical background and wide political experience, and who have the traits that a teacher must possess, should be included among the propagandists. Every assistance must be provided to broaden their pedagogical and methodological qualifications. Researchers should be included more systematically in the further training of propagandists; the application of new scientific results to propaganda work should be better organized.

4. Management of party education must place greater emphasis on elaborating and continuously updating the subjects, on developing the methods of instruction, and on evaluating the effect of party education:

Further theoretical consultations should be organized in which researchers, experts and prominent Marxist instructors summarize, by important topics, the latest research results in the social sciences and the evaluated experience in building socialism, in a form usable in party education;

The necessary substantive orientation on new questions and the exchange of practical experience must be ensured on a continuous basis;

More attention must be devoted to including in propaganda the local political, economic and ideological tasks, and to evaluating and utilizing the substantive experience of party education;

Oral briefing of the propagandists on timely ideological and political questions must be improved significantly.

PARTY TASKS IN THE ECONOMY EXAMINED

Budapest PARTELET in Hungarian No 9, Sep 80 pp 18-24

[Article by Dr Istvan Latos, section chief within the Central Committee Department of Party and Mass Organizations: "The Tasks of Party Work in the Economy"]

[Text] To improve our economic situation--and reconfirming its earlier resolutions--the 12th party congress adopted a program that prompts our party organizations to active and consistent work, the content and methods of which have been carefully weighed. Keeping the economy in the focus of party work, the 12th congress defined the principal direction of this work as follows: ". . . every organ, organization and member of the party must be assigned greater political responsibility for supporting and asserting the interests of society. Every party organization must show more initiative in uncovering the contradictions that accompany development, in elaborating the ways in which the tasks can be solved, and in eliminating the obstacles to implementation."

Already in the debate on the congress directives, the party organizations in question were deeply concerned with what requirements political work in the economy must meet, i.e., how they should work for the successful fulfillment of the economic objectives. A question that frequently arises these days is in what respects should we increase the political responsibility mentioned in the congress resolutions, and what should the party organizations do when they encounter enterprise behavior that conflicts with the economy's objectives.

Most such questions reflect a healthy search for ways and means, but in some instances also uncertainty. The cause of this uncertainty is that the party organization or those around it fail to fully understand the role of political work and merely expect measures from management. Some people are of the opinion that the party organization should not commit itself by politically supporting individual measures, because otherwise it would be unable to remain "impartial." This notion is just as untenable as the view that the local party organizations, amidst the present complex economic interrelations, are not qualified to evaluate, politically direct and control the activity of a plant or enterprise, because they allegedly lack the training and information for this.

The economy has always been an important field for political work. This is increasingly true today because also the party organizations encounter more and more often the greater requirements stemming from changes in the external and domestic conditions. As a result of the new price system and system of financial regulation that were introduced at the beginning of this year, the results and weaknesses of enterprise activity are more evident. It is becoming increasingly clear that the enterprises and plants must improve their activity to meet the requirements transmitted by the regulators and price system. In other words, there is greater economic pressure to uncover internal reserves.

The stricter conditions set by the new price system and the system of financial regulation affect the internal life of the enterprise collectives as well as public opinion. It is likewise obvious that the creation of certain political conditions, of a suitable political mood, is indispensable to implementing the measures for improving manpower management and for modernizing the enterprises' organization. But the uninterrupted supply of commodities is likewise an important political question. All these questions must gain specific content in party work. In a differentiated manner, of course, depending on the level of the party organization in question, or on the specific branch in which the party organization functions.

Responsibility for the Formation of the Enterprise Attitude

The party organizations have a decisive role and political responsibility primarily in the formation of the proper enterprise attitude and behavior. By the methods of party work, through reasoning, persuasion and mobilizing and organizing work, and--if necessary-- also with the instruments of criticism, the party organizations must strive to line up everyone for the realization of party policy. They should not tolerate helplessness, the attitude to wait until the first move is made above on certain questions. Instead, they should propose and raise political requirements for management to take the initiative whenever possible. They should reinforce the practice of seeking possible solutions, instead of pointing a finger at one another.

They should not lend political support to the view that more output can be achieved only with more input (i.e., investments). In the same way the party organizations cannot remain indifferent to, or even participate in, attempts to attribute one-sidedly the occasional tightening of the wage rates to shortcomings of the general wage system. Instead, they must uncover the local shortcomings in wage management and direct attention to their solution. It will not be in conflict with this principle if they pass on to the higher party organs their comments, together with their proposals, regarding the general wage system's application.

The party organizations cannot support views to the effect that "the regulators are ruining the enterprises." Instead, through their political work, they must spread awareness of the fact that the regulators--by transmitting the interests of the national economy--provide incentives for more

effective production. They must not associate themselves with the practice that the managers of certain production units go begging to various organs, for unwarranted material resources, invoking alleged interests of the economy. They should prevent by political means the "concealing" of opportunities and reserves in the course of planning, with the intention of using these reserves latter.

It is likewise obvious that the party organizations cannot tolerate a style of management that neglects the democratic elements and hampers the assertion of plant democracy, on the principle that "we are now living in a period of centralism." Nor is it any better when certain managers allow the opponents endless debates and consultations even after the decisions have been made. Sometimes even the party organizations support management when it refers to traditions and routine in its attempts to maintain the output of uneconomical products, even when the conditions for phasing them out have already been created. This, too, indicates that obsolete views and ideas persist also in political work, and that practice often develops accordingly. One such example is the so-called "base approach," when the party organizations measure the results of economic activity not in terms of the economy's demand and realistic possibilities, but only in relation to the level achieved in previous years.

Starting with the planning of work and ending with control of the resolutions' implementation, the elected party organs, their staffs, and the party organizations must strive even more consistently for the faster unfolding of qualitative changes, for the improvement of effectiveness, and for the necessary transofrmation of the production structure. Through their political work the party organizations must exert influence to ensure that the plans of the enterprises and plants are in accord with the economy's objectives, and that the enterprise conduct economic activity in accord with the economy's situation and needs.

Reconciliation and Ranking of Interests

In the work of the party organizations that function in production it is particularly important that they properly support the interest relations. When the interests of the national economy and of the enterprise are in conflict locally, or when one does not coincide with the other, the party organizations are confronted with a dilemma: whose side to take? A general answer to this question is fairly easy, because we must say that every party organization, in any situation and under all circumstances, must unambiguously support the economic policy that expresses the overall interests of the economy and of society, and it must support local efforts accordingly. Thus, when it becomes temporarily necessary to subordinate the local interests, the party organization must have sufficient political courage to support this. But we must also realize that no enterprise collective can be forced to permanently undertake an activity that disregards its own interests. In the case of conflicts of interest, therefore, the party organization must first of all investigate whether a solution can be found that

serves the interests of both the enterprise and the economy. The fact that the system of regulation also guides enterprise actions in this direction makes it easier to find such a solution. Our plants and farms that have the highest rates of economic growth are convincing proof that the pursuit of correctly interpreted enterprise interests can successfully advance also the assertion of the economy's objectives. Such an approach helps to avoid situations in which an impossible "division of labor" arises, the management promoting the interests of the enterprise, and the party organization forced to protect the economy's interests. The fact that the political responsibility of the party leadership and economic management cannot be separated in this manner requires no further explanation, since both the party leadership and management are politically responsible for local enforcement of economic policy.

On the basis of the present requirements, then, the relationship between the party leadership and economic management could be defined also by saying that the party organization's responsibility is twofold. On the one hand the party organization is management's closest ally, helper and supporter, in every effort to promote the interests of the enterprise, but only in accord with and due consideration for the party's economic policy and society's objectives. On the other hand the party organization is the most consistent critic of any management efforts to promote local interests harmful to the interests of the economy, or which merely serve to mark time instead of acting in the direction of progress.

Mutual trust is the basis of fruitful cooperation between the party leadership and economic management. This also presupposes that in the process of work, which has been developed with adequate responsibility and in consultation with the party organizations, we cannot raise constant doubts as to whether management is functioning properly. Enterprise and cooperative managers are able to adopt and realize meaningful measures only if they can rely on the helpful support of the party organizations. This applies particularly to so-called "unpopular" measures.

It would be moot to argue whether the party organizations can adopt political decisions concerning the economy. On the one hand, the Central Committee resolutions grant the party organizations suitable independence to do so, and even increase their responsibility in this respect. On the other hand, even in the past the subject of criticism was the quality of the decisions of this nature, rather than the right to make them. With their carefully prepared and deliberated political decisions, the party organizations have provided suitable guidance and assistance for management's work even in the past. The justification of this will exist also in the future and will even increase. But if the party organizations make decisions and adopt measures in matters that belong in management's competence, if they usurp management's responsibility, this will not only affect the style of work but will be debatable also in principle. In summing up the debate at the 12th party congress, Comrade Janos Kadar clearly referred to this when he said: "If someone is called a party secretary, he should be one; if someone is a director, let him direct, and so on."

Political Support of Economic Measures

In its pertinent standpoint the Political Committee provided policy guidance for improving the work of unprofitable or capital-poor plants and enterprises, including also their manpower management and management of wages. The affairs of the enterprises are being put into order. It should be noted that the resolution encourages own initiative, in addition to the central measures. In this context we can expect that occasionally enterprise management will be forced to adopt also measures that will painfully affect the worker collectives as well as the managers themselves (in conjunction with profit-sharing or bonuses, for example). It is quite obvious that in such situations the party organizations cannot adopt the standpoint that the realization of such measures is solely management's responsibility, and it is better for the party organization not to intervene because it might worsen its relations with the masses. Neither can they join the weeping and indignant, instead of engaging in constructive political work. Nor can they create a dichotomy by urging and encouraging management to tighten labor discipline, while at the same time the undisciplined and negligent are granted protection at the party forums.

What should the party organizations do at plants that are in economic difficulties? Their most important task is to employ the methods of political work in making the workers understand the existing situation, and the reasons behind the measures that have become necessary. With convincing arguments they must explain to what extent the enterprise's insolvency can be attributed, besides the foreign economic effects, to the shortcomings of economic activity, and they must point out the local possibilities and ways for remedying the situation.

The party organizations must meaningfully participate in developing the remedial measures. They should carefully weigh whether such decisions are realistic, whether the economic organs are acting with due circumspection, whether the ideas are effective, and they must take into account also the expected political effects. However, this is only one side of party work. The other side is that the party organizations must actively participate in the implemention of the measures, which of course they must do by the methods of political work.

Party resolutions still in force sum up the basic principles and more-important methods of the party organizations' economy-directing work. These party resolutions provide even today guidance on everything from political aid in preparing the enterprise plan, to the work of control. In conjunction with political direction and control, however, some important questions of work style have begun to arise in a novel way, in agreement with the changes in practice. The effects of these questions are being felt also in the work of the party organizations.

It is becoming increasingly evident that political direction, assistance and control cannot be confined to concern for only the production units

that are in economic difficulties, on the assumption that the efficient enterprises are running smoothly anyhow. All spheres of the economy are now undergoing processes that cannot dispense with the party organizations' attentive and effective work, and thus also in party work it is necessary "to play several instruments" simultaneously. The party organizations must always accurately perceive which are the economic tasks whose realization they must aid through their political activity, with particular attention. Which of course does not mean that they should not consider other questions at all, nor that they can and must concern themselves only with the tasks defined explicitely in the party resolutions.

Streamlining the Working Methods

Just as in other areas of life, also in the economy there appear from time to time tasks that are of political importance, and therefore suitable attention must be devoted to them regardless of whether there are applicable party resolutions. Such tasks exist, for example, in some areas of agriculture. It is of great importance for our economy and social policy that the party organizations concern themselves not only with the development of production and the improvement of effectiveness, but also with avoiding ups and downs in farm production, declines from a higher level to levels already surpassed (for example, in vegetable and fruit production).

Likewise noteworthy is a certain formalism in coordinating cooperation among enterprises. In many places coordination ends with preparing a series of "coordination plans," whereas the most fundamental requirement would be that each of the party organizations concerned undertake political educational, organizing and mobilizing work at its own enterprise, to reinforce the managers' and workers' sense of responsibility for fulfilling on schedule and well the tasks that stem for them from the division of labor.

In the spirit of the congress resolutions, therefore, it is necessary to use also the instruments of party work to ensure that the party resolutions concerning the economy's development are treated practically and not in the abstract. Let us heed the need that our party membership called to our attention during the preparations for the congress, when they told us that they understood the situation, were ready to act, but wanted to be told what specifically they had to do. It is obvious that this cannot be defined centrally for everyone. The local organs must play the leading role in this.

Another justifiable demand is that the political decisions at the various levels should, in addition to setting the economic objectives, also define more accurately the content, direction and occasionally also the methods of the party's political work. Likewise the party organs in the course of control should not investigate merely the effectiveness of the individual production units' work in the light of the economic indicators; they should

also explore the effectiveness of political work in the given topic and area, as well as the questions on which the local party organizations might require assistance or the party members might expect advice and encouragement.

Five-year plans are now being drafted nationally as well as at the enterprises. From this stems the requirement that the party organizations concern themselves more intensively, over and above the everyday questions, also with the questions of development, with ensuring the conditions necessary for the realization of the economic objectives contained in these plans. Here again the important thing is to correctly identify the points of main effort, because we cannot afford to forget even for a moment that we can best secure our coming five-year plan by successfully fulfilling this year's national economic plan, respectively the enterprise tasks stemming from it.

The 12th party congress, and subsequently the elections to the National Assembly and the local councils have confirmed that both the party and the nation are confident. Also in the future our party organizations will have to work in the direction and by the methods that will further strengthen this confidence, this faith in the future. Recently one of our objectives has been to make the public understand the causes of our economic difficulties. Of course, this task has not lost its timeliness entirely even today. However, we should consider whether it is proper and expedient to adopt in our party work the practice of speaking one-sidedly only of our mistakes, failing to bring up as arguments the results already achieved, and to promote and disseminate the methods that ensure better results.

It might seem perfunctory--but it is not--that in its 13 May 1980 resolution the Political Committee abolished the drafting of obligatory annual action programs for the party organizations. In some places this has raised doubts as to whether the party organizations should concern themselves with annual economic activity. It should be emphasized that this resolution does not reduce but, to the contrary, increases the responsibility of the party organs and organizations at every level, for including in their work plans, with appropriate emphasis, the political tasks in conjunction with fulfilling the annual plan.

Assertion of the Principles of Cadre Policy

Among the stricter requirements of economic activity, both the results and shortcomings of cadre work are evident more clearly than before. In evaluations of the work of individual managers we often encounter such judgments as "Good manager, but bad politician." In such cases we may justifiably ask whether anyone can be a good manager--especially today--if he is not aware of the political importance of his work, if he does not anticipate the political effects of his actions, if he does not assert democratic elements in his work. From another point of view we may likewise ask whether a manager can function with sufficient political responsibility if he does not recognize the economic interrelations of his measures, if he is incapable of making suitable and sound economic decisions, or if he does not act in due time.

There are some indications that certain managing organs occasionally favor mediocrity to ceaseless striving for the new and modern. It is noticeable that many party organizations prefer managers who "do not rock the boat," who do not exert themselves but neither create any special problems, while the "restless" managers with their endless proposals only create more work for the managing organs. This, too, shows that the requirements for managers should be enforced more uniformly and more demandingly.

A phenomenon of a different kind also was mentioned at the 12th party congress, and we might call it a refined form of discrimination against managers. Various derogatory adjectives are affixed to comrades in important economic posts. And so what, one might say. But the matter is not quite so simple if we take also into account that such adjectives--born unusally of crude demagoguery and professional jealousy--are affixed specifically to those managers who are leaders in their field, by seeking the new, economical and modern, and at the same time accepting the risk involved. The party organizations' failure to condemn this practice is particularly dangerous, because it could perhaps discourage efforts of this type. And should this practice become general, we could come into conflict with principles that are essential elements of our cadre policy. But it is obvious that we do not wish to defend those who have justly earned the various adjectives, by their improper conduct and mode of life.

More frankness and sincerity are needed also in uncovering mistakes and in bringing the responsible persons to account. However, it would be harmful and unfair to shift all blame for the problems and shortcomings in the economy only on managers. We believe that merit and responsibility go hand in hand, for the developed problems as well as for the successes. For this very reason no party organizations can adopt the standpoint that everything bad stems from management. One-sided generalization is harmful also in this case. When mistakes and shortcomings are detected, it is much better to investigate their specific causes, and then everyone--both the party leadership and management--can draw the necessary conclusions regarding his own work. In this way we can achieve that the political leadership, management, the subordinates and managing organs will all work responsibly for common objectives, with everyone working in a disciplined manner and to the best of his knowledge, in his own field.

CENTRAL COMMITTEE RELEASES FIGURES ON EDUCATION, KISZ

Budapest KOZNEVELES in Hungarian No 16, 1980 pp 4-5

[Article: "From the Central Committee's Preliminary Report"]

[Text] Grade Schools

In 1978, 2.32 percent (in 1974, 2.16 percent) of the national investment went to the developments of teaching institutions, while 5.5 percent (in 1974, 5.02 percent) of the national budget went for their upkeep.

In 1975 the kindergartens, the grade schools, the high schools, and the institutions of higher learning employed 132,500 educators, while in 1979 this number rose to 151,500. In 1975, 22.5 percent of the kindergarten teachers and 6.9 percent of the grade school teachers lacked degrees and certifications. By 1979 this ratio declined to 8.3 percent among kindergarten teachers and to 5.1 percent among grade school teachers.

Over 2 million persons (in the 1979-1980 school year 2.3 million persons) are studying in the various state educational institutions.

In the course of the past 5 years, the number of children who receive full kindergarten care has increased from 316,000 to 457,000. In 1974, for every 100 kindergarten-age children, 72 attended. In 1979 this number rose to 85. In the course of the past 2 years, kindergartens have been obliged to receive more populous age brackets. For this reason it has been impossible to satisfy fully all of the demands for kindergarten services, despite the faster than customary development and the mobilization of significant social forces.

An ever-increasing number of the school-age children (in 1979, 97.2 percent) receive organized preschool training. In 1979-1980, 96.3 percent of the 6-year-olds began their school studies. Primarily because of lack of maturity, the rest were enrolled 1 or 2 years later. The number of grade school students rose from 1.108 million in the 1974-1975 school

year to 1.148 million in the 1979-1980 school year. Of the 6 - 13 year-old children, 98.8 percent attend school, while the rest of them ceased their studies either temporarily or permanently. In addition to regular schooling, in 1974, 31 of every 100 students also received institutional care (day care, study room, board and room). In 1979 this number grew to 410. Among these, the percentage of those receiving day care has increased from 27.7 percent to 36.8 percent. Almost 11,000 children live in grade school dormitories.

In 1974, 89.6 percent of the 16-year-olds finished grade school during the daytime, while in 1979, 9.7 percent did so.

An additional 3 percent received training in physical therapy or comparable education until the end of obligatory age at the evening and correspondence sections of grade schools.

High School

Of those who completed grade school in 1974, 87.8 percent, and 92.9 percent of those who finished in 1979 continued their studies immediately on the secondary level. Another 2-3 percent did so within 1 to 2 years. Nearly four-fifths of these continued their education at institutions that offer trade specializations, including trade schools and technical high schools.

In 1974-1975 a total of 63.9 percent of the 14 - 17 year-olds received instruction on the secondary level, and in 1979-1980, 69.9 percent did so.

In 1974-1975, 17.5 percent of the trade school students and 20.4 percent of the high school students lived in student centers, study centers and dormitories. By 1979-1980 their ratio rose to 19.1 percent and 23.7 percent, respectively.

In 1978, 48,000 passed the trade school examinations. In 1979, 45,700 graduated from the day sections of high schools, among them 23,700 from technical high schools.

In 1974, 32.5 percent, and in 1979, 37 percent of the high school graduates continued their education at institutions of higher learning. (The children of physical workers among the first year students amounted to 41.9 percent.)

College and University Education

In 1979-1980, 64,400 students studied at the day sections of the institutions of higher learning. In 1974, 6.79 percent and in 1977, 8.8 percent of the 18 - 22 year-olds received instruction at various institutions of higher learning.

In 1979, 15,300 received diplomas from the day sections of institutions of higher learning. This was 2,100 more than in 1974.

In 1979 about 124,000 young people joined the labor force from various educational institutions. This is 39,000 less than in 1974. This decline can be attributed partially to the smaller number of their age group, and partially to the fact that a larger percentage of them continued their education on the secondary level. Over two-thirds of them go to work with various trade certificates.

Between 1975 and 1979 a total of 58,000 received their degrees from the evening and correspondence sections of institutions of higher learning. Nearly 151,000 graduated from secondary schools, and 117,800 finished the 8th year of elementary school. The number of those enrolled in evening and correspondence schools has declined during the past few years on all levels of education.

Participation in various specialized training programs outside of the regular schools, however, has continued to increase. Since 1974, the number of students in those training programs has doubled. In 1978, 336,000 participated in this type of training, and 62 percent of these completed various continuing education programs.

The Educational Level of the Workers

During these years, the level of education among the workers continued to rise. In 1975, 58 percent, and in 1980, 65 percent of those in the 15 years and older category had at least a gradeschool education. In 1975, 19 percent of the 18 and older category, and in 1980, 23 percent of this same category had finished high school or a higher level of education. In 1975, 5 percent, and in 1978, 7 percent of the 25 and older category possessed a college or a university education.

The Work of the Hungarian Communist Youth Association [KISZ]

The 855,000 members of the KISZ are active in nearly 30,000 local organizations. While 29.3 percent of the working youth are involved, KISZ membership among the trade school students is 58.19 percent, among the secondary school students 68.8 percent and among the college and university students 78.1 percent.

About 15,000 of college and university level KISZ members participated in the activities of scholarly student circles. Over 28,000 student KISZ members took part in various scholarly competitions, and an additional 85,000 of them participated in the study movements. In 1975, 25,000 and in 1979, 56,000 young people worked in centrally organized building camps.

Membership of the Hungarian Pioneers Association exceeds the 1.25 million mark. Of the 6 - 14 year age group, 95 percent are members of the Pioneers Associations. The activities of the Pioneers' Association and of the Little Drummers Circles are aided by the participation of 58,000 educators, 24,000 youth leaders, and 35,000 noneducator adults.

Nationality Associations

The total number of nationalities amount to about 300,000.

At present 43,300 students of national minority background study in 498 educational institutions. Most of them study the language of their nationality as a subject.

Over 500 cultural societies are active among the nationalities.

The number of clubs for the cultivation of their language has increased, as has the number of informative lectures given in their national languages. Nationality newspapers are being published on a regular basis, nationality radio programs are offered regularly, and now even television programs have been initiated in German and Serbo-Croatian.

On Mass Sports and Physical Education in Schools

The limits of physical education and sports have broadened, and their personnel and equipment have improved. More up-to-date plans have been introduced for physical education training. The number of physical education hours have risen to 3 per week both in the elementary schools and in the high schools. Moreover, 2 hours per week of such training has become obligatory even during the first 2 years of the institutions of higher learning.

Five hundred students per year receive degrees in physical education and become teachers. In the course of the past few years we have completed 400 conditioning halls and gyms, 750 smaller courts, 80 pools for swimming training, and 280 cultural centers which are also suitable for sports activities and physical education training.

At present there are 163 grade schools and 26 secondary schools that have classes specializing in physical education.

Seven hundred thousand grade school students participate in the Olympic competitions sponsored by the Pioneers Association, and in various other mass sport events. At the secondary schools, about 150,000 students are active in various sports clubs and student sports associations.

NEED TO IMPROVE TEACHING OF SOCIAL SCIENCES CITED

Bucharest ERA SOCIALISTA in Romanian No 18, 20 Sep 80 pp 20-22

/Article by Olivia Clatici, secretary of the Party Committee of Bucharest University Center, and Ion Rebedu, member of the Party Committee Bureau: "Teaching Social Sciences in Step with Life's Demands"/

/Text/ Establishing the unbreakable tie between the educational process and its objective support, the facts of socialist construction, is a constant endeavor of our party, which believes that the source of the theory of scientific socialism's strength is its foundation in experience, in the dynamic evolution of experience, and in careful and thorough study of the specific-historical processes and phenomena. As the documents of the 12th Party Congress indicate, this places heavy responsibilities upon the social sciences, which are called upon to take a more enterprising, competent and intensive approach to the general problems presented by the revolutionary changes taking place both in Romania and abroad and to inculcate advanced ideas and convictions in the consciousness of studious youth.

The RCP's emphasis upon the social sciences was also indicated at the recent national conference (4-6 September 1980) with teachers and researchers in the economic and social-political sciences, where they seriously discussed the ways and means of improving the teaching of social sciences in the light of the 12th Party Congress' requirements to bring this activity up to the level of Romania's socioeconomic development and to eliminate some lags and defects.

The social sciences are expected to contribute to the progress of the schools and of education on all levels as major means of socialist education and preparation of youth for work and life. As Comrade Nicolae Ceausescu pointed out, "It is a duty of honor of the schools to turn out not only good workers and specialists but also informed citizens with an advanced conception of the world and life and deeply devoted to the socialist cause and the inspired effort to carry Romania to new peaks of progress and civilization."

To meet this demand, the Party Committee of Bucharest University Center has regularly checked how the directives in the 12th Party Congress' program

documents are being integrated in the teaching process and how improvement of the content of the social sciences and development of their role in student education are being provided for. To this end we started discussions with the department heads, analyses in the bureau of our party committee and in those of the committees and bureaus [sic] in institutes, discussions in departments and exchanges of experience. We tried to go beyond the stage of general, overall analyses and directives and to focus the activity in this area upon the most specific objectives we could and upon diverse but precisely defined problems. These efforts resulted in specific measures to improve the performance in institutes and departments, while the more general conclusions were used in exchanges of experience.

The last period has been marked by a real improvement and enrichment of the work of social science personnel in the Bucharest University Center. The courses and seminars are dealing more regularly and competently with problems concerning construction of the fully developed socialist society in the present stage in Romania, the necessity of a new quality in all activities, the new economic-financial mechanism and its operation, the concept of agrarian revolution, the contradictions in socialism, the roles of the party and state in building the new society, the development of socialist democracy, the role of the nation in the present period, the evolution of the present social-political systems and of world political trends, and the formation and development of a new kind of relations among socialist states and among the communist and labor parties. They also take up points about the correlation between the base and superstructure in the present stage in the light of the requirements of the new economic mechanism, the general problems of humanism and the human condition in Romania's socialist society, and the concept of material and cultural civilization. Comrade Nicolae Ceausescu's work and the basic aims of party policy, which lend substance and effectiveness to the teaching of social sciences, are broadly reflected in the analytical programs and in the content of the lectures or courses.

The party organs and the managements of the institutes and departments are trying to correlate teaching of the economic and social-political sciences more closely and completely with the new and complex problems facing Romania's socialist society in the present stage. Accomplishment of this high aim requires a broader and more intensive coordination, from the standpoint of each discipline, of the social science courses with the real facts of experience, as well as greater efforts to eliminate the pedantic and speculative tendencies that are still sometimes found in teaching.

The effectiveness of teaching social sciences to a great extent depends upon competent and discriminating adjustment of the analytical programs to the characteristics of the institutes. Our university center is making a number of positive efforts in this direction. As we know, the programs devised by the Ministry of Education and Instruction, based upon consultation and collaboration of the best teachers, are "outline-programs." But there are situations where such a program is well planned for 90-120 hours (philosophy, scientific socialism or basic problems of national and party history) but must be taught in fewer hours (30, 45 or 60). Of course these situations require

some compromise and selection of the problems. Of course it would be desirable to have uniform programs throughout Romania for every schedule, but as it is the difficulty is resolved in departments and institutes. Sometimes the departments compromise the problems specified in the outline-programs according to the number of available hours they have, and this leads to cursory and incomplete instruction in some cases. Other departments have chosen to select the problems, in an effort to eliminate the duplications and repetitions in teaching some social science disciplines. Thus some technical institutes have decided to treat some subjects in only one of the courses in order to reduce the repetitions between the course on scientific socialism and the course on basic problems of national and party history. But this solution has not proved very satisfactory either, because it deprives students of a complete understanding of some important processes in Romanian history.

And so more regular efforts must be made in departments to adjust the outline-programs of the various social science disciplines to the number of hours allocated in a given institute, so that every course without exception will have a unified and close-knit subject matter of its own. To this end it is highly advisable to arrange more methodological discussions in departments and on the level of the university center. Their conclusions will really help to make the outline-programs sufficiently specific and to eliminate the duplications still to be found in the teaching of some social science disciplines.

Treatment of the problems of contemporary capitalist society in courses and seminars is a question that is receiving more attention. The conclusion has been reached that in view of the present evolution of capitalist society and the interdependence of international politics, instruction in scientific socialism (and in the other social science disciplines as well) must include a competent and discriminating analysis, throughout a course and according to its subject matter, of the aggravations of the general crisis and the overall, contradictory processes and trends appearing in various countries and regions of the capitalist world. From this standpoint the general problems of contemporary capitalism must be treated in greater depth and a more aggressive stand must be taken against theories apologizing for the bourgeois way of life.

The problems of teaching social sciences are approached as a component part of the educational process and the broad effort to master party ideology. The social sciences must be taught in close correlation with the characteristics of the various educational institutes and the occupations for which the students are being trained. It is particularly necessary to stress this point because the so-called "adjustment to the characteristics" is still narrowly interpreted at times. It is often done by making simplistic and vulgarizing specifications, underrating the theoretical aspect in favor of so-called "specific analysis" based on sometimes insignificant cases or examples. A high theoretical level of teaching all disciplines and a close correlation between them and the future specialist's field are essential to the students' all-around education. The experience of the university's Physics Department is relevant here. It arranged discussions between the physicists and philosophy teachers concerning uniform treatment of concepts like matter, motion, space, time etc. This collaboration was also effected at joint scientific meetings

and symposiums, among which the one on the subject of "Philosophy and the New Advances in Physics" was particularly interesting and useful. The Philosophy Department of the Polytechnic Institute also intitiated such actions, with good results in intensive study of the philosophical implications of the new advances of science and in clarification of some problems in the logic and methodology of science. The philosophy collective at the Construction Institute initiated and organized a series of annual scientific discussions of the question of the present scientific-technical revolution and its social implications, for purposes of uniform teaching of this problem in both the social science disciplines and the specialized ones. Of course the examples could be continued.

In teaching scientific socialism especially, determining the balance between theory and its practical application is essential to effective teaching. In comparison with the other social science disciplines, this course should make the greatest contribution not only to students' acquisition of a given body of knowledge concerning society and political science but also to their understanding of Romania's social reality and the Romanian political system, improving their political-ideological indoctrination and developing their socialist awareness. All departments are making regular efforts to teach a course in theory that is firmly achored in life and social experience.

In the light of the tasks assigned by the 12th Party Congress, the social science teaching process heavily emphasizes the problems in the program that give the students a sound ideological background and directly contribute to the future specialists' proper interpretation of contemporary phenomena and of the revolutionary processes going on in Romania in the present stage.

Unfortunately there are still some shortcomings in the maintenance of high standards in the courses. Sometimes a lesson that is well organized in general is taught in a simplistic, dull way that does not capture the student's attention or arouse his interest sufficiently. These situations are not due to pedagogical failure alone but also to the fact that the lectures are insufficiently analytical at times and based upon limited and sometimes even obsolete information.

The educational value of the social science courses also depends on the presence in the lectures of an intensive and moral scientific analysis of the realities of the western world and of the various trends in contemporary bourgeois thought.

Many courses have been brought up to a suitable level in this respect, such as a number of philosophy courses taught at the university and the Academy of Economic Studies, scientific socialism courses taught at the Polytechnic Institute etc. But there are still some shortcomings in this area. Out of a desire to tell all or prehaps from a certain snobbery, some teachers with a wealth of information from the technical literature simply bombard students with bibliographical data as if the data were familiar to them, at the expense of content analysis of the works or trends of ideas to which they refer. In other cases they resort to long quotations from authors' works. Clearly the educational

value of such lessons is greatly impaired. Some lectures do not invite discussions or enter into any broader dialogue of ideas because of insufficiently informed teachers who speak from collateral information and not from any direct source. Without overlooking some shortcomings in the circulation of the subject information, we think it is also a question of some laxity on the part of some teachers and their own inadequate effort toward information and documentation of this kind.

Departmental as well as interdisciplinary theoretical discussions are a way of enriching the content of social science teaching, expanding scientific information, clarifying new or controversial problems, and substantiating our stand on various contemporary non-Marxist trends of thought. The usefulness of these discussions on subjects of wide interest is demonstrated by the good results obtained by the departments that organize them periodically on subjects that are well considered and scheduled over several years, such as "Confrontations of Ideas in the Modern World" (at ASE /Academy of Economic Studies/, the university and the art institutes), "Religion and Politics" (at the university), "Requirements of Scientific-Materialist Education" (at the IMF /Institute for Medicine and Pharmacy/), "The Economic-Ideological Relationship in the Process of Socialist Construction" (at ASE and IPB /Bucharest Polytechnic Institute/), "The New International Economic and Political Order" (at ICB /expansion unknown/), etc. From this standpoint, experience tells us that the roles of the department collectives and the department heads especially should be developed. The latter often perform a primarily administrative activity rather than any substantive control or guidance of the educational process and the training of their colleagues.

In adopting the various measures, the Party Committee of the University Center and the responsible elements in the institutes have regularly consulted the teaching collectives, from whom they have invariably received help and useful suggestions. For instance, one problem taken up in the discussions was that of forming the scientific-materialist conception of the students and all those who work in our university center. It was concluded that united action should be taken on several levels, by forming a sound scientific culture of the students through teaching and mastery of all disciplines accompanied by a good ideological training. Mere accumulation of scientific information, however valuable, does not automatically lead to atheist convictions. It must be reinforced by an adequate ideological training and mastery of a new set of values, as well as regular political, ideological and cultural programs to influence the consciousness and psychology. For this purpose courses and seminars are placing more emphasis upon problems of ethics and molding social behavior in keeping with the values of revolutionary socialist humanism.

Our committee has specially emphasized the course on "Basic Problems of National and Party History" with its extensive educational values. The course is of great interest to students. But steps had to be taken to remedy some defects because at first there were too many conflicts with other courses, especially as regards the proportions among the historical periods. Every teacher was tempted to expand the chapter that was more pertinent to his research efforts.

There were also some exaggerated presentations of problems more or less in dispute among specialists, to the neglect of highly important problems specified in the program. Uniform teaching of this course was accomplished by arranging a series of discussions sponsored by the university's Department of Philosophy and History.

The teaching staff is heavily emphasizing enlistment of the students in the effort to improve social science teaching and to probe the various aspects of the revolutionary theory. The practice has been extended of basing seminars on material collected by students in their period of productive experience (the university and the Agronomic Institute). The Construction Institute as well as others has had good experience with sociological field studies with students. All the institutes are arranging scientific meetings of social science students' circles. The Polytechnic Institute has obtained notable results in this area. The interest and originality with which the students prepare their reports for these meetings are noteworthy, and the extent of their participation directly depends upon the talent and enthusiasm of the teachers and the specific efforts of the organizations of the Communist Students Association to improve their command of the social sciences.

The social science offices play an important part in improvement of social science teaching. There are offices performing well at the IMF in an interdisciplinary capacity, and a combined didactic and political-ideological effort is being made there. The ASE has organized a political economics office with an original design. Regrettably the university only has an office of philosophy and sociology also serving the other disciplines. It is making a major contribution by organizing theoretical discussions, but it is less devoted to improving teaching and seminar methods.

For complete fulfillment of the assignments of the 12th Party Congress to the social sciences and Comrade Nicolae Ceausescu's directives at the start of the new school year, and in the light of the conclusions drawn from the National Conference of Teachers and Researchers in the Economic and Social-Political Sciences, the Party Committee of Bucharest University Center entered on its agenda for this university year many actions in which an important part is played by regular (usually bimonthly) information of the social science teachers about current economic and political problems and by arrangement of scientific and methodological discussions on the University Center level that will be both interdisciplinary and within disciplines. For example discussions are planned for the first half-year on subjects like Romania's socioeconomic development and transition to a new quality in all fields, substantiation of the new economic-financial mechanism in the political economics courses, the concept of agrarian revolution in the light of the documents of the 12th Party Congress, teaching of philosophy and the students' scientific-atheist education, problems of contemporary capitalism, ideological confrontations in the world of today, etc. Efforts to strengthen the departments' scientific activity will be intensified as a prerequisite for enhancing the content and educational effectiveness of the social science disciplines. Emphasis will be placed on formation of an exacting and principled atmosphere in all departmental collectives that will foster self-improvement, the sense of responsibility and a

militant approach. Steps will also be taken to further develop the role of the party organs and organizations in guidance, support and control of activity in all social science disciplines.

Our committee and the party organs in the institutes and departments are concentrating on the efforts on behalf of the problems of content of social science teaching, in order to lend a militant character to the courses and seminars and to contribute to the formation of the students' dialectical-materialist conception and advanced economic and political thinking. This is the only way that social science teaching can make its particular contribution to the great objectives of ideological and political-educational work assigned by the party and to the education of the future specialists in such a way that they will devote all their strength and their working and creative capacities to the construction of socialist civilization in Romania.

MEMBERS OF COMMITTEE FOR PEOPLE'S COUNCIL'S PROBLEMS LISTED

Bucharest SCINTEIA in Romanian 13 Sep 80 p 7

/Unattributed article: "The Committee for Problems of the People's Councils"/

/Text/ Ioan Retegan, first vice chairman of the Executive Committee of the Alba County People's Council, member of the RCP Central Auditing Commission; Raveca Ratiu, chairman of the Executive Bureau of the Cimpeni City People's Council, Alba County; Cornel Pacoste, first vice chairman of the Executive Committee of the Arad County People's Council; Constantin Stoica, director of the Arad County Enterprise for Communal and Housing Administration; Mihai Badl, foreman at the Arad Wood Processing Combine, chairman of the Organization of the ODUS /expansion unknown/ of the section; Gheorghe Matei, first vice chairman of the Executive Committee of the Arges County People's Council; Valeriu Nicolescu, chairman of the Executive Committee of of the Pitesti Municipal People's Council, alternate member of the RCP Central Committee; Valeria Stanescu, chairman of the Executive Bureau of the Leordeni Communal People's Council, Arges County; Vasile Ardeleanu, first vice chairman of the Executive Committee of the Bacau County People's Council; Agurita Alexandrescu, chairman of the Executive Committee of the Onesti Municipal People's Council, Bacau County, member of the RCP Central Committee; Constanta Semeniuc, chairman of the Executive Bureau of the Tirgu Trotus Communal People's Council, Bacau County, deputy in the MAN /Grand National Assembly/; George Vaida, first vice chairman of the Executive Committee of the Bihor County People's Council, member of the RCP Central Auditing Commission; Maria Dobos, laboratory assistant at the Oradea Milk Industrialization Enterprise, deputy on the Bihor County People's Council; Sofron Munteanu, first vice chairman of the Executive Committee of Bistrita-Nasaud County People's Council; Mircea Purdea, chairman of the Executive Bureau of the Lechinta Communal People's Council, Bistrita-Nasaud County; Stefan Panaitiu, first vice chairman of the Executive Committee of the Botosani County People's Council; Lucia Hutanu, chairman of the Executive Bureau of the Leorda Communal People's Council, Botosani County, deputy in the MAN; Gheorghe Cutitei, first vice chairman of the Executive Committee of the Brasov County People's Council, member of the RCP Central Committee; Margareta Krauss, chairman of the Executive Bureau of the Codlea

City People's Council, Brasov County, alternate member of the RCP Central Committee, Dumitru Diaconescu, foreman at the "Tractorul" Enterprise in Brasov, member of the working people's council; Stefan Ilies, first vice chairman of the Executive Committee of the Braila County People's Council, member of the RCP Central Auditing Commission; Stana Budur, planer at the "Laminorul" Enterprise in Braila, deputy on the county people's council; Gheorghe Tudor, first vice chairman of the Executive Committee of the Buzau County People's Council; Nicolae Vasilescu, director of the Buzau County Road and Bridge Directorate, deputy on the county people's council; Ioana Titeica, chemical operator, member of the section's ODUS Committee at the Buzau Plastic Processing Enterprise; Ion Geana, first vice chairman of the Executive Committee of the Caras-Severin County People's Council; Aurel Lascu, chairman of the Executive Committee of the Resita Municipal People's Council, Caras-Severin County; Ion Ciorba, first vice chairman of the Executive Committee of the Cluj County People's Council, member of the RCP Central Auditing Commission; Constantin Crisan, chairman of the Executive Committee of the Cluj-Napoca Municipal People's Council, alternate member of the RCP Central Committee; Ioan Jakab, cable worker at the Cimpia Turzii Metallurgical Combine, Cluj County, deputy on the city people's council; Ion Popa, first vice chairman of the Executive Committee of the Constanta County People's Council; Gheorghe Popa, chairman of the Executive Committee of the Constanta Municipal People's Council, member of the RCP Central Auditing Commission; Niculina Buzoianu, fitter at the Constanta Group of Enterprises for Communal and Housing Administration; Ioan Dragos, first vice chairman of the Executive Committee of the Covasna County People's Council, member of the RCP Central Committee, deputy in the MAN; Magdalena Suto, chairman of the Executive Bureau of the Covasna City People's Council; Dumitru Gherghisan, first vice chairman of the Executive Committee of the Dimbovita County People's Council; Aurica Paduroiu, chairman of the Executive Bureau of the Comisani Communal People's Council, Dimbovita County; Gheorghe Gavrus, first vice chairman of the Executive Committee of the Dolj County People's Council, member of the RCP Central Committee; Costica Chitimia, chairman of the Executive Committee of the Craiova Municipal People's Council; Georgeta Nicolae, architect at the Dolj County Design Institute, chairman of the County ODUS Committee; Ioan Bejan, first vice chairman of the Executive Committee of the Galati County People's Council; Emilia Andronache, chairman of the Executive Committee of the Tecuci Municipal People's Council, Galati County; Cornel Boca, head foreman at the Sintering Furnace Plant of the Galati Iron and Steel Combine, deputy on the county people's council, Hero of Socialist Labor, member of the Executive Committee of the Working People's Council; Ionel Dicu, first vice chairman of the Executive Committee of the Gorj County People's Council; Ion Iorga, foreman at the Motru Mining Enterprise, Gorj County, secretary of the mine party committee, member of the National Council of Working People; Emeric Pataki, first vice chairman of the Executive Committee of the Harghita County People's Council; Emeric Szabo, chairman of the Executive Committee of the Odorheiu Secuiesc Municipal People's Council, Harghita County; Teodor Bendris, chairman of the Executive Bureau of the Toplita City People's Council, Harghita County; Alexandru Voiculescu, first vice chairman

of the Executive Committee of the Hunedoara County People's Council; Constantin Lupulescu, miner, team leader, at the Lupeni Mining Enterprise, deputy on the Hunedoara County People's Council; Andrei Voileanu, first vice chairman of the Executive Committee of the Ialomita County People's Council; Maria Calin, chairman of the Executive Bureau of the Lehliu-Sat Communal People's Council, Ialomita County; Neculai Ibanescu, first vice chairman of the Executive Committee of the Iasi County People's Council; Eugen Nechifor-Moraru, chairman of the Executive Committee of the Iasi Municipal People's Council, alternate member of the RCP Central Committee; Alexandrina Babes, crew chief at the Iasi "Tehnoton" Enterprise, deputy on the county people's council; Nicolae Matei, first vice chairman of the Executive Committee of the Ilfov County People's Council, member of the RCP Central Auditing Commission; Iuliana Tanasa, chairman of the Executive Bureau of the Urziceni City People's Council, Ilfov County; Dumitra Dragomir, chairman of the Executive Bureau of the Minastirea Communal People's Council, Ilfov County; Dumitru Ciuclea, first vice chairman of the Executive Committee of the Maramures County People's Council; Rafila Han, welder at the Maramures County Construction Trust, member of the Baia Mare Municipal Party Committee; Marius Cojocaru, first vice chairman of the Executive Committee of the Mehedinti County People's Council; Aurel C... /garbled surname/, chairman of the Executive Bureau of the Girla Mare Communal People's Council, Mehedinti County; Ernest Szotyori, first vice chairman of the Executive Committee of the Mures County People's Council, member of the RCP Central Committee; Ana Herman, chairman of the Executive Committee of the Sighisoara Municipal People's Council, Mures County; Ileana-Maria Csilla-Fulop, technician at the Mures County Construction Trust, member of the trust's ODUS Committee; Valerian Gaina, first vice chairman of the Executive Committee of the Neamt County People's Council; Maria Morariu, chairman of the Executive Bureau of the Brusturi-Draganesti Communal People's Council, Neamt County; Dumitru Cristea, first vice chairman of the Executive Committee of the Olt County People's Council; Stefan Fugaciu, chairman of the Executive Bureau of the Caracal City People's Council, Olt County; Maria Nitu, engineer at the Slatina Food Equipment Enterprise, member of the Bureau of the CC /expansion unknown/ of the ODUS, vice chairman of the Executive Committee of the Olt County People's Council; Ion Vilsan, first vice chairman of the Executive Committee of the Prahova County People's Council, alternate member of the RCP Central Committee; Aurelia Ciufu, chairman of the Executive Bureau of the Baicoi City People's Council, Prahova County; Floarea Nedelcu, chairman of the Executive Bureau of the Poiana Cimpina Communal People's Council, Prahova County; Elena Nitu, laboratory assistant at the Brazi Petrochemical Combine, deputy on the Ploiesti Municipal People's Council; Ioan Caita, first vice chairman of the Executive Committee of the Satu Mare County People's Council; Iuliana Haidu, chairman of the Executive Bureau of the Berveni Communal People's Council, Satu Mare County; Ilarie Girjoaba, first vice chairman of the Executive Committee of the Salaj County People's Council; Aurel Cret, chairman of the Executive Bureau of the Napradea Communal People's Council, Salaj County; Iosif Eckenreiter, first vice chairman of the Executive Committee of the Sibiu County People's Council, alternate member of the RCP Central

Committee; Ana Carpinisan, leatherworker at the Sibiu "13 Decembrie" Footwear Enterprise, vice chairman of the ODUS Committee, deputy on the municipal people's council; Ioan Simiceanu, first vice chairman of the Executive Committee of the Suceava County People's Council, deputy in the MAN; Ioan Otarniceriu, chairman of the Executive Bureau of the Cimpulung Moldovenesc City People's Council, Suceava County; Eusebie Lates, director of the Suceava County Design Center, deputy on the county people's council; Zaharia Carbunaru, first vice chairman of the Executive Committee of the Teleorman County People's Council; Maria Bernea, chairman of the Executive Bureau of the Grigeni Communal People's Council, Teleorman County; Liviu Minda, first vice chairman of the Executive Committee of the Timis County People's Council, alternate member of the RCP Central Committee; Radu Balan, chairman of the Executive Committee of the Timisoara Municipal People's Council; Elena Toth, winder at the Timis County Construction and Assembly Trust; Constantin Amariei, first vice chairman of the Executive Committee of the Tulcea County People's Council; Ion Badilas, chairman of the Executive Bureau of the Lunca-Vita Communal People's Council, Tulcea County; Eugen Tarhon, first vice chairman of the Executive Committee of the Vaslui County People's Council; Veronica Harnagea, chairman of the Executive Bureau of the Muntenii de Jos Communal People's Council, Vaslui County, member of the RCP Central Auditing Commission; Gheorghe Stoica, first vice chairman of the Executive Committee of the Vilcea County People's Council; Vasile Suciu, chairman of the Executive Bureau of the Dragasani City People's Council, Vilcea County; Ion Cioara, first vice chairman of the Executive Committee of the Vrancea County People's Council; Sita Nita, chairman of the Executive Bureau of the Dumbraveni Communal People's Council, Vrancea County; Nicolae Ganea, first vice chairman of the Executive Committee of the People's Council of the Municipality of Bucharest, member of the RCP Central Committee, deputy in the MAN; Maria Gheorghe, chairman of the Executive Committee of the Bucharest Sector Four People's Council, member of the RCP Central Committee, deputy in the MAN; Constantin Balta, master machinist at the "23 August" Enterprise, vice chairman of the Bucharest Municipal ODUS Committee and of the ODUS CC; Georgeta Popa, master garment worker at the Bucharest Clothing and Knitwear Enterprise, vice chairman of the Executive Committee of the Bucharest Sector Six People's Council; Ion Neacsu, train engineer at the Bucharest Passenger Depot, Hero of Socialist Labor; Gabriela Ene Raciu, chemical laboratory assistant at the "Nufarul" Enterprise, member of the Sector Six ODUS Committee and member of the Council of the FDUS [Socialist Democracy and Unity Front] of the Municipality of Bucharest; Ludovic Fasekas, member of the Political Executive Committee, secretary of the RCP Central Committee, chairman of the Committee for Problems of the People's Councils, deputy in the MAN; Cornel Onescu, first vice chairman of the Committee for Problems of the People's Councils, member of the RCP Central Committee, deputy in the MAN; Ion Gheorghe, vice chairman of the Committee for Problems of the People's Councils, member of the RCP Central Auditing Commission; Stefan Romeo Dragomirescu, vice chairman of the Committee for Problems of the People's Councils; Constantin Voinescu, director of the Directorate for Organization, Control and Local State Administration within the Committee for

Problems of the People's Councils; Paul Sfetcu, deputy director, secretary of the Party Committee in the Committee for Problems of the People's Councils; Ion Ciobotaru, deputy director of the Directorate for Systematization, Planning and Construction within the Committee for Problems of the People's Councils; Paula Prioteasa, vice chairman of the Central Council for Worker Control of Economic and Social Activity, deputy in the MAN; Gheorghe Brehuiescu, deputy minister of finance, member of the RCP Central Auditing Commission; Mircea Georgescu, deputy minister of forestry economy and construction materials; Alexandru Heinrich, deputy minister of technical-material supply and control of the management of fixed assets, member of the RCP Central Auditing Commission; Marin Constantin, deputy minister of agriculture and the food industry, vice chairman of the UNCAP /National Union of Agricultural Production Cooperatives/, alternate member of the RCP Central Committee; Rada Mocanu, deputy minister of education and instruction; Maria Fluxa, deputy minister of domestic trade, deputy in the MAN, member of the Bureau of the National Council of Women; Lidia Oradean, state secretary in the Ministry of Health, alternate member of the RCP Central Committee; Ion Radulescu, vice chairman of the CENTROCOOP /Central Union of Consumer Cooperatives/; Stefan-Aurel Baciu, director on the State Planning Committee; Virgil Hampu, secretary of the CC of the UTC /Union of Communist Youth/; Mihail Goran, chairman of the Committee of the Union of Trade Unions in State Administrative Institutions and People's Councils; Adrian Alexandrescu, director of the Bucharest Research and Design Institute for Systematization of Housing and Communal Administration; Valeriu Dumitru Cristescu, director general of the Central Institute for Construction Design and Direction, alternate member of the RCP Central Committee, deputy in the MAN; Cezar Lazarescu, chairman of the Union of Architects; Maria Maritescu, secretary of the Executive Committee of the Bucharest Sector Six People's Council.

The Executive Bureau of the Committee for Problems of the People's Councils

Chairman: Ludovic Fazekas.

First vice chairman: Cornel Onescu.

Vice chairmen: Ion Gheorghe, Romeo Dragomirescu, Gheorghe Matei, Maria Nitu.

Members: Nicolae Ganea, Maria Fluxa, Constantin Marin, Rada Mocanu, Virgil Hampu, Iosif Eckenreiter, Lidia Oradean, Mihail Goran, Magdalena Suto, Gheorghe Brehuescu, Stefan-Aurel Baciu.

WEST GERMAN COMMENT ON AID TO YUGOSLAVIA

Frenkfurt/Main FRANKFURTER ALLGEMEINE in German 22 Sep 80 p 1

[Article by Johann Georg Reissmueller: "And What About Yugoslavia?"]

[Text] At about the same time as the FRG Government arranged a large bank loan to Poland, securing it in part with federal government guarantees, it rejected a Yugoslav request for similar aid. It had reasons worth considering for supporting Poland financially at this time. Yet Yugoslavia is not getting anything.

For his "no" to Belgrade, too, the federal chancellor was able to give reasons which could not be refuted out of hand. The Federal Republic gradually has been reaching the limit of its ability to help out other countries with huge loans. Yugoslavia in turn is already in debt to Western countries to a worrisome degree. It apparently is suffering from faults in its economic system which it is making little effort to rectify. In that respect, however, the situation is no better in Poland.

Yet the basic position is different in Yugoslavia, which, unlike Poland, is not a member of the Warsaw Pact. In Yugoslavia the Soviet Union has no say in political matters, or in economic policy either. The Yugoslav leadership makes its decisions of its own volition, having no need either to ask Moscow beforehand or to account to it afterwards. In the course of the past decades it has introduced an economic system remote from the communist-Soviet one--"socialist self-administration" of enterprises and competition among the self-administered enterprises. True, the principle is not followed consistently. First, there were inconsistencies from the start which have not been gotten rid of to this day; secondly, state economic planning, being pushed back time and again and time and again making itself at home, has affected prices, loans and investments; and finally there has been the party rule, pervading state and society.

These faults above all are the reason why the Yugoslav economy has long since failed to accomplish what it could accomplish in light of its great natural, technological and spiritual national resources. No one can say whether the Yugoslav leadership in the near future will muster up the insight and energy needed to remedy this situation. But if it wants to do so, no external power will be able to stand in its way.

For the time being it is resorting to half measures, seeking to fill the worst gaps. The government in Belgrade rigorously devalued the dinar and froze the prices of many goods, and then it sought loans abroad. Finding little readiness for granting them in the West, it turned to the Soviet Union. Belgrade is maintaining silence about what political concessions Moscow demanded in exchange for its financial aid, but it would run counter to all past experience for Yugoslavia to have escaped such concessions. So it must not now come as a surprise if Yugoslavia takes political steps which are not really in line with the intention announced by Tito's successors to keep their distance from the Soviet Union. Probably none of it will basically change the political picture of communist Yugoslavia. Nor do the Soviets expect that. They would already be satisfied if Yugoslavia failed to do one thing or another in its foreign policy and domestically curbed even more strongly what the Soviets call "anti-Sovietism." What concerns the Soviets far more is that the whole political thinking and sentiment in Yugoslavia--including that in its party--which since the mid-1960s has slowly but constantly turned away from Moscow, should again be oriented more toward it. For this, one loan will not suffice, but perhaps there will be other opportunities.

Such results--and, even more, such prospects--must give the West food for thought. Can it be a matter of indifference to us that Soviet influence in Yugoslavia is growing? And does the West not at last need a carefully thought out and constant joint policy on Yugoslavia? The one it has followed so far is incoherent, fitful, determined more by scheming on the part of individual Western countries than by their common interest, more by high-sounding empty phrases than sober action. It has long since proved ineffective. Of course, even the best policy will not enable the West just like that to wrest Yugoslavia from Soviet influence. The Soviet Union will have a foothold in the Balkan multinational state as long as its leaders believe that (notwithstanding all the differences in internal systems and foreign political interests and despite all the poor experience gathered in 35 years) they are tied to the Soviet leaders by a common bond--"socialism." Late in the 1960s the Yugoslav party once seemed on the verge of cutting this bond. Yugoslav party writings were stating at that time that what was ruling in the Soviet Union actually was not socialism but the rule of a bureaucracy--something as far removed from the Yugoslav socialism of self-administration as was the capitalist system.

Tito wanted none of that; he always regarded the Soviet Union as the (unloved) power guaranteeing any socialism in the world. Yugoslavia's future road depends above all on whether his successors persist in this. The West cannot make Tito's successors reach a decision on this, but it must not make it more difficult for a decision to be reached which would be better for Yugoslavia and the West.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

'RUDE PRAVO' REPORTS ON INTERPARLIAMENTARY UNION SESSION

AU221523 Prague RUDE PRAVO in Czech 20 Sep 80 p 7

[Unattributed Report: "About the Development Decade: From the Session of the Interparliamentary Union"]

[Text] Berlin, 19 Sep (CTK)--The agenda for Friday's session of participants in the 67th Interparliamentary Union (IPU) conference in Berlin concerned the UN decade of development in the period 1981-90, and its economic, social, educational, scientific, cultural and ecological aspects. The joint report prepared by the appropriate IPU committee was presented by Thomas Larue from France. More than 80 delegates contributed to the discussion on this point.

In his speech, Herbert Panster, member of the Czechoslovak delegation, appealed to the participants in the conference to support, by their active efforts, the new development strategy--which must become international in scope--in keeping with the appropriate UN documents. He stated that without a basic change in international relations, the developing countries will achieve their national targets in the economic and social sphere only with difficulty. Like the other socialist states, the CSSR is also striving to establish favorable conditions for the development of all countries, the member of the Czechoslovak delegation said in his speech.

The GDR delegation's opinions on the proposals submitted to date at the 67th IPU conference were voiced by Hermann Axen, SED Central Committee Politbureau member and secretary, and chairman of the foreign committee of the GDR people's chamber. In his speech at the session, Axen said that the main idea of the proposals is the need to preserve world peace. There is no sensible alternative to peaceful coexistence.

He further stated that the participants in the session agree that the process of detente cannot be consolidated and expanded without eliminating the main causes of international tension. They disagree on the question of where the main causes of tension lie. That is why a clear answer to this question is of great significance. Some claim that the main sources of aggravation of the international situation are Afghanistan and Iran.

The progress of historical realities disproves such claims, Hermann Axen stated, and pointed out that the NATO council had adopted a decision on the long-term program of increased armament as far back as May 1978. And the historical chance provided by the proposal on reducing the number of medium-range missiles in the European part of the Soviet Union, provided the new American nuclear missiles are not deployed in Western Europe--which was voiced by Leonid Brezhnev, CPSU Central Committee general secretary and chairman of the USSR's Supreme Soviet Presidium, in October 1979 --was then thwarted by the NATO council's decision adopted in December of the same year in Brussels.

There exist numerous controversial problems, numerous conflicts. But none of them should divert the conference negotiations from the pivotal matter on which the life and future of our planet depend. Political detente must be complemented by military detente, Hermann Axen stressed.

SAFEGUARDING OF STATE, MILITARY SECRETS URGED

Sofia SERZHANT in Bulgarian No 8, 1980 p 14

[Article by Col Petur Kolev: "Safeguarding of State and Military Secrets the Supreme Duty of the Serviceman"]

[Text] Crimes involving the divulging of state and military secrets are among the gravest crimes since their commission always causes or may cause grave harm to the interests of the state and especially to the country's security and defense capability. Many examples are known in history when the divulging and discovery of military secrets were the reason for either winning or losing critical moments in military operations. That is why the strictest safeguarding of military and state secrets has been elevated to a fundamental requirement of military discipline, to an inviolable and sworn duty of servicemen. Watching over state and military secrets is the Penal Code, which has defined as crimes, and set appropriate penalties for, the most serious violations in this regard. In connection with these crimes, it is advisable, to begin with, to clear up the question: What is a state secret? This concept is defined by Article 104, Paragraph III, of the Penal Code as follows: "State secrets are facts, information and subjects of a military, political, economic or other character, the discovery of which by another state or foreign organization can harm the interests of the People's Republic and particularly its security. The list of facts, information and subjects which constitute state secrets is established by the Council of Ministers." Such a list has been issued in 1980. Obviously, military secrets are no different from state secrets--they are the same and, in fact, the most important kind thereof.

The law provides for several kinds of crimes depending on the manner, purposes and consequences of the secret. The gravest of these is espionage, which is provided for in Article 104 of the Penal Code. It is considered to have been committed when any person, unmindful of his duty, family and honor, discloses or--even if he has not yet disclosed--is gathering, for the purpose of disclosure to a foreign state or organization, information constituting a state secret. The penalty provided for such a crime is the most severe there is under our penal system: death or deprivation of liberty for from 10 to 20 years. Owing to the great public danger of this

crime, anyone who puts himself at the service of a foreign state or organization in order to serve it as a spy, even if he has not yet begun to gather or has not disclosed information constituting a state secret, is punished too, although more lightly. Making ready to commit espionage is punishable too, as well as the concealment by any persons of a spy, or failure to inform the authorities of the commission of such a crime. Espionage can be committed by both civilians and servicemen, by both Bulgarian citizens and foreigners. When it is committed by a serviceman, it is more gravely reprehensible and may therefore be more severely punished.

Article 357 of the Penal Law provides for punishment by deprivation of liberty for up to 5 years for anyone who divulges information constituting a state secret which had been entrusted to him or which had become known to him from his position or job, as well as for anyone who in any other connection learns of this information. To constitute this crime it is not required that the perpetrator have set it as his purpose to render service to a foreign state or organization and to do harm to our country. It is necessary, however, that he realize that harm to the Bulgarian People's Republic can follow from divulgence of the information. By "divulgence of information" is meant bringing a state secret to the knowledge of another person or persons. Who the person is to whom the secret is communicated, whether known or unknown, friend, relative, official, etc., is of no significance. What is essential is that the communication be made without any official need. Divulgence even with the stipulation of preservation of complete secrecy is still a crime. This act is not characterized as espionage; however, the defense capability of the state is imperiled by it. Therefore, a more severe penalty is provided when as a result of its commission particularly grave consequences have ensued or may ensue for the security of the country (from 3 to 10 years deprivation of liberty).

The next article of the Penal Code (358) defines as a crime the loss of documents constituting a state secret. By "loss of documents, publications or materials" must be understood letting them out of the possession of the person to whom they were entrusted. They are let out of his possession when, contrary to his wish, they are not in the place appointed for their safekeeping or with him, as, for example, dropping them on the street, leaving them behind in a railway car due to absent-mindedness, their disappearance from an unlocked office etc. The loss can be either permanent or temporary. The document does not have to be strictly official. It can still be a draft, and publications can still be in the form of rough copies. The loss of such materials creates a real possibility of their falling into the hands of someone who wishes our country ill, and of harm thus being done to the country's security. That is why punishment by deprivation of liberty for up to 2 years or correctional labor is provided for these cases, too. However, if especially grave consequences have ensued or may ensue from commission of the deed, the penalty is deprivation of liberty for up to 5 years.

A state secret can be revealed not only deliberately, but also by carelessness. Due to the high political awareness and vigilance of the

service personnel of the Bulgarian People's Army the gathering of espionage information by enemy intelligence through spies is becoming increasingly difficult, and for this reason foreign intelligence strives to take advantage of the naivete, gullibility, talkativeness and the tendency of some citizens to show off how much they know. In precisely these instances such citizens involuntarily occasion the disclosure of secrets. If the disclosure is a result of carelessness manifested in the nonobservance of the regulations for the safeguarding of documents containing secrets, the penalty provided is appreciably more severe. This is because strict observance by junior and senior noncommissioned officers of the requirements established in the manual on the storage of and work with the documents and materials in question is extremely imperative.

The cultivation and inculcation by them in service personnel of noble patriotism and revolutionary vigilance, combined with the respect-inspiring commands of the law, are and will be a stable barrier against the possibility of the disclosure and divulging of state and military secrets.

STATEMENT BY COMMANDER OF VASIL LEVSKI MILITARY ACADEMY

Sofia BULGARSKI VOIN in Bulgarian No 7, 1980 p 3

[Statement by Maj Gen Delcho Stanimirov, candidate of military sciences, and chief of the Vasil Levski VNVU [Higher People's Military Academy]: "Looking For the Equation"]

[Text] Imagine a comprehensive class with the trainees. They act both as commanders and performers. They carry out assignments in the areas of tactical, drill, physical, and fire training. They relate them. They combine their actions. The dynamics during such a class is rather high and the working time is packed. The effectiveness of practical execution is high. Yet, the head of such a class is an instructor. Therefore, he must possess full and substantiated knowledge of all school subjects. He must be familiar with them in depth. He must assess each performance and correct every mistake. This instructor must be a comprehensively developed military man. That is what we want to experiment with, passing from the comprehensive development of the instructor through the full utilization of the training time to the comprehensive development of the trainee. This is because it frequently happens that each instructor concentrates on his subject, be it tactics, fire practice, or mathematics.... The result? Every day the trainee is persuaded by the different instructors that their subjects are the most important. He tries to focus on those subjects and, in the final account, fails to learn any one of them properly. Yet, comprehensive training would enable the trainee to realize alone, without outside interference, what he needs in modern combat and what he will need as a commander. One of the means for creating such an attitude is our efforts to develop organizational standards, provide necessary theoretical knowledge, turn the students into organizers, and test their feeling for organization.

As to novelties in training, discovering something new would be difficult. We are trying to improve methods, class-group studies above all. There is a competition in our school: At the end of May each chair must submit a suggestion on improving the organization of class-group training.

Major General Delcho Stanimirov, candidate of military sciences, and chief of the Vasil Levski VNVU.

TRAINING AT VAPTSAROV NAVY ACADEMY REVIEWED

Sofia BULGARSKI VOIN in Bulgarian No 7, 1980 pp 3-4

[Article by Col Vasil Chankov: "Clearance to the Sea"]

[Text] The traditional interest in the navy academy remains high. The number of applicants has not declined regardless of the high grade average required, the difficult competitive examinations, and a number of other requirements. The call of the sea is not only powerful and romantic but insurmountable.

In the course of its almost 100 years of existence, the academy has come to be considered by the Bulgarian people as a first grade school which provides not only excellently trained cadres for the navy but highly skilled specialists for the national economy. The academy's alumni range from admiral's to lieutenants and from captains of freighters and fishing boats to their fourth mates.

The visit of the Yemeni military delegation gave me the opportunity to see a number of new things in the training-material facilities which were lacking in the course of my previous visits. Subsequent meetings and conversations revealed other new aspects and, above all, a creative restlessness triggered by the new party orders on education. The command-teaching staff responded to them with a feeling of great inner satisfaction. This may have been because they contain some ideas and experiments which have been thoroughly tested for the past two years. Above all, they affect various aspects of the tactical direction of training and education. Adding to this the fact that there is nothing more practical than good theory, we can explain the desire of the Vaptsarov faculty to develop active, independent, and creative comprehensive thinking. This effort is started with the very first days, in the period of adaptation of the students to military life, involvement with the collective, and familiarity with regulations. This is a period when old habits are eliminated and concepts as to life in the school are reassessed. This is a difficult and delicate period. In addition to the commanders, the classroom instructors--experienced people who have gone through navy life and have developed a pedagogical approach--join in the solution of the problem. They are irreplaceable advisors and instructors.

"Initially, I too considered this method somewhat skeptically," said instructor Captain First Rank P. Georgiev. "Subsequently I changed my view. The method proved to be successful not only during the adaptation period but subsequently as well. It offers the possibility to become directly involved in a small collective, to study the specific behavior of the student and his interests, gifts, personal concerns, and characteristics of his personality and his qualities and, hence, his better orientation toward a certain type of ships, for example, or the development of a command-organizational feature which is acquired by the graduates. To be a tutor is a pleasant role."

This has yet another new aspect. According to the curriculum 16 hours have been assigned to NOT (Scientific Organization of Labor) of the student. Experience has proved that the young trainees are slow in orienting themselves in the daily schedule. They are short of time for theoretical subjects and other activities. All of a sudden they are drowned in an avalanche of responsibilities and some of them panic. That is precisely why I took this short yet extremely necessary course in NOT. Let us add to it some 10 hours in the course of which the students become acquainted with the departments and the curriculum for the first two and the subsequent years. This "excursion" is also the first vocational guidance and introduction to the future specialty.

The third aspect was discussed in the course of my conversation with Rear Admiral Emil Stanchev, the academy's commander. I was surprised by his categorical statement that, "We have eliminated summer practical training!" I was surprised, knowing that he knows better than I do that a sailor is a sailor when he is at sea. He also knows better the nature of the sea, the nature of the service, and the need for practical knowledge and skills. He put an end to my objections curtly:

"We eliminated it in its previous aspect. Why should it be in the summer? Do we sail in summer only? . . . The trainees usually practiced during the inactive navigational season. Most of the main training assignments were issued without their participation, without experiencing the tension which normally accompanies this type of command activities. Now it is different: They directly perform the respective positions in the combat detachments, even though as understudies. The upper courses practice as commanders of combat units and know what to expect. They study documents, training data, and specific requirements. . . . Our desire remains that of training cadres who will be able to fully assume their first position as officers. For example, the old hands should not be able to say, "We taught the lieutenant how to carry out his first training assignment!" Something else is important: We try to give our trainees an amount of theoretical and practical knowledge which would be the basis for their further career growth. We try to teach them to think creatively, boldly and independently, to have a feeling for the new and the ability to engage in continuing independent training. . . ."

Let me merely add that the two training ships are rarely kept at the dock. Actually, it is aboard those vessels that the Vaptsarov students learn their first lessons in seamanship, starting with scrubbing the decks and ending with navigating.

We reach the fourth aspect which is particularly important.

The practice of clearing a person before assuming a corresponding position has always existed in the navy. A seaman may be a school graduate and a specialist. He may be in signals, engines, machine guns, gunnery, or torpedoes. Regardless of all this, aboard the ship to which he has been assigned he must take another examination before he is given the right to be on duty. The same applies to the officers. Now, however, something else is practiced: senior students spend several months in training aboard the ships to which they will be assigned. Is there anything better than to study in detail the equipment, the obligations, the personnel, the combat assignments, and all parts of the ship? At the same time, however, in the course of such practice they study and take admission examinations. This is to the benefit of the trainee, the school and, above all, the combat readiness of the units for the simple reason that this clearance makes it possible to reduce the period of time in the course of which the young officer must, along with dozens of other obligations, prepare for his examinations. The clearance now is a permanent part of the state examination. Passing this examination is proof of the ability to carry out all duties in weapons and technical facilities control in battle.

In turn, the school thus acquires a real idea as to the extent to which the training process is correlated with the practical needs of the navy.

I discussed the four aspects which far from cover everything new that has developed in the activities of the command-teaching faculty or the searches and intentions. Problems of education, raised in the party's documents, follow a number of directions. They are complex and important. The school's command is aware of the great efforts which remain to be made to reach and convert from "the development of the individual features and capabilities to the discovery and development of man's comprehensive capabilities, talents, and qualities, and the molding of a many-faceted and, in the future, comprehensively developed individual capable of total development in life," as Comrade T. Zhivkov outlined the tasks at the education plenum. It is not my intention to discuss scientific research activities which are successfully developing in the school and yielding good results or the rich ideological and esthetic work done by the politicial department and the party and Komsomol organizations which leave irradicable marks on the spiritual development of Vaptsarov students. I merely wished to trace the outlines of the tie between the school and the reality. The direction chosen by the N.Y. Vaptsarov VNVMU is the true one!. . .and so is its combat course!

STATEMENT BY COMMANDER OF VAPTSAROV NAVY ACADEMY

Sofia BULGARSKI VOIN in Bulgarian No 7, 1980 p 4

[Statement by Rear Admiral Emil Stanchev, chief of the N. Vaptsarov VNMU [Higher People's Naval Academy]: "Clear Practical Direction"]

[Text] The faculty of our academy has repeatedly proved that it can successfully cope with all assignments. Excellent knowledge of navy service and life and requirements determines the clear practical direction which has become a leading feature of all training units. Most of the teachers are officers with good sea training. In addition to proven lasting scientific and pedagogical interests, they have also acquired proper practical experience which they use now and impart to the trainees. It would hardly be necessary to mention names, scientific degrees, or titles. It would even be hardly necessary to emphasize the fact that the faculty is aware of the latest scientific and technical achievements and modern concepts regarding naval combat or that each chair is a laboratory engaged in research and experimentation in developing the future cadres as skillful seamen and organizers.

The desire of the teachers is to bring theory closer to practice, turn knowledge into convictions, and determine as fully as possible the trends in the various realms of knowledge developed as a result of the achievements of the scientific and technical revolution. Along with the development of independent thinking and an active and creative attitude toward the service and the profession, they want to promote an aspiration toward the harmonious shaping of the individual and toward self-advancement. Unquestionably, this could be accomplished by people who are themselves the carriers of strong personality features, people who are intelligent, erudite, and dedicated. To the honor of the school this applies to most of the faculty. They have trained and led to the sea generations of talented navigators, artillerymen, mechanics, miners, signalmen, and so on. They have taught us good and valuable things. Yet, precisely because he spends a lifetime giving something of himself, the teacher must steadily improve himself, keep his mind alert to new developments, and have a generous heart.

Rear Admiral Emil Stanchev, chief of the N. Vaptsarov VNMU

I myself am a school alumni and can say with a pure conscience that the people chosen to teach here have always been interesting and capable. Naturally, their training is the subject of comprehensive concern by the command.

CRITICAL EVALUATION OF AIR FORCE ACADEMY

Sofia BULGARSKI VOIN in Bulgarian No 7, 1980, pp 4-5

[Article by Col Tsvetan Tsakov: "Forward and Upward, But How?"]

[Text] The trainee who will become a student of the Georgi Benkovski Higher People's Air Force Academy in the autumn of 1980 was born in 1962. Consequently, he is 18 years of age. He will graduate as a lieutenant-engineer in 1985, at the age of 23. Assuming (with our best wishes) that he will remain in the service until the age of 50, i.e., in the year 2012, unquestionably he will have adequate opportunities to show his qualities as a military educator.

Therefore, the Air Force Academy student who will enter the academy this autumn will be friend, educator, confessor, instructor and guide. He will love and suffer, he will work and, if necessary, he will die for the citizens of the socialist society who will develop in the second half of the 21st century.

This detail has a certain significance, for which reason the educational process and, particularly, the training-education process at the air force school has its concerns as well as the best possible means for their removal: the party's decisions and the comprehensive successes of developed socialism. Once again the so-called subjective factor or, in other words, man, finds himself between the means and the problems, and between mind and matter. This applies to the man of today, the man among us, the man within us who faces the great assignment of educating, teaching, and training other men ready and able to live under real socialism which they must build and defend. This is what complicates matters even (and above all) in our thinking, for only a short while ago we were still trying to glance at the future looking no more than two to three fivie-year plans ahead, working in the field of education on a "piece rate" basis, or in a situation in which the customer brought the material while the master contributed his labor. . . . That is how things went on. In some cases this was not bad at all. It was even successful. However, we can no longer do this.

Actually, why not?

The average grade of the trainees in the winter semester of this school year was rated very good, 5.07. Let us mention some other figures of major importance. For example: 35 percent of the students completed the semester with an overall excellent grade; nine grade sections averaged an excellent grade; four of them number in their combat ranks only students with excellent grades in combat and political training. At the same time, the academy won the championship in the all-VUZ mathematical olympics and rated second in physics. Unquestionably, this is a good certification for the Benkovski students and a clear indicator of (but not exclusively) their possibilities in mathematics. Therefore, it was not astounding in the least in this competition for more knowledge and its conscientious application in flight practice but it was precisely the VNVVU [Higher People's Air Force Academy] to win the championship in the competition among military academies. This is precisely what took place.

We have mentioned recent results, for in the 35-year-old history of this smithy of cadres for antiaircraft defense and air force such satisfactory achievements have always existed. However, they have been rapidly and irrevocably left behind. The general belief is that what today is the pride of the school--high grades in the training-education process and pleasing results in sociopolitical work is a gain which, even though quite recent, has also become obsolete. Firstly, because it still is not the most effective consequence of the level of material and spiritual possibilities of the people on both sides of the "barricade;" secondly, should we consider it as the necessary base for the generation of the second half of the 21st century, at best it could be considered as semi-satisfactory.

That is why we can no longer go on this way.

How is the G. Benkovski VNVVU working for the future? Any kind of future is possible to the extent to which and the way in which it is developed today. Without engaging in predictions, we could say unquestionably that the air force school is properly aware of, expediently working, and bravely surmounting the obstacles to the desired future. The school will progress forward and upward. We shall try here to answer quite briefly, and from one side of the question only, how?

Yes, how indeed?

Through reorganization. This may sound prosaic but the essence of what we are discussing is the molding of a comprehensively developed individual, and the full realization of our contemporaries and those who will follow us.

Future changes are based on firm grounds and have sufficient prequisites for their implementation, mainly from the qualitative viewpoint. This is wonderful. However, we should acknowledge that enhancing the scientific standard of teaching to the level of scientific research is a difficult task. It cannot be implemented in 1 or 2 years, for it presumes the higher scientific-methodical and practical training of the teachers, the commanders and the instructors, and the availability of suitable training aids and, in general, of even more modern training-material facilities. However, should all these conditions be met in their totality, or could we begin to raise the scientific standard as of today, even though only in some areas and sections of training? In the school it is believed that there should be no waiting. Work is already underway on the qualification characteristics of all leading participants in the training and education process. This is very important, for it is on this basis that training plans and curriculums will be improved. Possibilities for a more effective solution not only of present problems but problems which will arise over the next 10 to 15 years must be created in the very next year. No one has the illusion that this would be will be easy, as has been the case frequently in the past. Third generation technology presumes and demands far more efforts and intellect than ever before. Simply stated, it must be studied in a new, a different way. It appears that in some cases one must plunge straight into "dark rooms," since the level reached in the very good amount of knowledge acquired so far is entirely inadequate to encompass new developments. The command-organizational qualities needed in modern combat are another such "room." I was convinced by the comrades that the school as a whole can insure even higher theoretical knowledge and far greater practical skills and habits. Yet, matters are different in terms of the ability of the future pilots and specialists to develop as commanders-organizers. This is a far more complex type of activity for which even the experience acquired in the course of decades is inadequate. Yet, when experience is short, the first thing to be expected and to be done is to acquire it. Naturally, the Soviet experience is at our disposal, as is the experience of its repeated application. However, its application cannot be easy or without conflicting with obsolete thinking. As to the training-material facilities, a decisive "goodbye to mediocrity" is being voiced here. This need here is felt and, above all, in some cases outstripped by a very sharp timely feeling that, finally, the school has its training technical operations facility. Recently several exceptionally useful laboratories were opened and we could stress quite confidently that the future aviators are learning how to drive cars with the help of a most modern training ground and even use a simulator. This is, so to say, an outstripping of expenditures, the more so since many other interesting and, unquestionably useful facilities are under construction. However, since it is a question of the base, in our modest view it needs a few more "goodbyes." For a number of subjects there are no. . . study aids. In other words, there are no textbooks. It is incredible yet it is a fact that currently only 50 percent of the necessary textbooks and other aids are being published. The school had its own

press which was closed down. It has an extensive (the first in all military academies!) training-television system whose development has been virtually stopped. In both cases it is a question of budget appropriations. Unquestionably, we must be objective and assess matters realistically. However, it is hard to understand how such restrictions could affect so strongly the quality of the training process. The contradiction between necessity and possibility is explainable. However, this author failed totally to understand how a supermodern television system could remain idle and, at the same time, the former printing press is nothing but a good memory. If there are no textbooks there should be at least television, or vice versa. Otherwise, we are thrown far back, even back to the beginning, when neither of those were available. Naturally, this is somewhat of an exaggeration. Yet, this still calls upon us to think. Actually, not every step back is dangerous. There was a time when the closest educators of the students--platoon and company commanders--had air force training and had been top students in their classes. Now it is believed that platoon commanders do not have to be air force alumni or excellent students. I do not entirely understand the reason for this. We know that only those who are best educated and trained should engage in direct educational work. The opposite leads to the making of jokes even though this is welcomed by people with a feeling for humor. It is something else that is not welcome: the fact that behind the laughter the bitter truth remains of the hen which was tricked and sat on duck eggs. The ducklings were hatched and went swimming while the hen remained helplessly ashore. . . . There was a time when the postulate that he who enters the school must complete it strictly dominated! At that time superbly trained flight instructors had to devote exhausting efforts to "hatch" chicks which never turned into eagles. This was an unpleasant and, above all, a dangerous occupation. The approach today is dialectical: The lazy are dismissed along with all those who create the so-called "lower level." This is worthy of approval. However, should we also not adopt the same dialectical approach toward the teachers? Some of them still avoid or, to say the least, consider it trite to "display" the military trend of their lectures. The teachers are ideologically developed and have excellent professional training. However, not all of them are motivated by the desire to improve. Consequently, our trainee may be deprived of the opportunity, this very autumn, to learn from someone how, to begin with, he should attend the lectures. Were this to continue, he would not have the opportunity to develop within himself an interest in scientific work, let us not mention the dream of being included in the activities of teaching-scientific collectives when he reaches the senior grades. Since such "inclusion" has been so far incidental, the grounds for brighter prospects are not entirely optimistic.

Naturally, such things are known, for which reason the mandatory "Ways and Directions of the Work of Commanders, Teachers and Instructors for Making

the Training-Education Process Consistent With the Decisions of the July BCP Central Committee Plenum on the Development of Education in the Bulgarian People's Republic," regardless of how daring they may be as a thought, in some respects, to me at least they sound alarming as well.

It is easy to understand this concern, for it is also the responsibility for a generation which will live in the second half of the 21st century.

STATEMENT BY COMMANDER OF AIR FORCE ACADEMY

Sofia BULGARSKI VOIN in Bulgarian No 7, 1980, p 5

[Statement by Aviation Maj Gen Dimitur Karadzhikov, deserving flyer of the Bulgarian People's Republic, chief of the Georgi Benkovski VNVVU [Higher People's Air Force Academy], military pilot first class: "Ideologically Convinced and With High Specialized Training. . . "]

[Text] Our academy is well known among the people and the youth. It enjoys good prestige among the higher educational institutions in the country and has made an irreplaceable contribution to military training and the development of combat capable and combat ready antiaircraft and aviation forces. Our successes as well are known. However, we cannot allow ourselves to ignore the problems facing us, standing out in connection with the organization of the educational system in accordance with scientific progress and with the current and future social requirements and interests in defending the socialist society. We well realize that education and the entire cadre training system are experiencing an important period of truly profound reorganization. The first public education congress was a historically significant event in our education. In accordance with the letter by Comrade T. Zhivkov to the Komsomol Central Committee and the decisions of the congress, as well as in the light of the decisions of the July 1979 BCP Central Committee Plenum, we are working for the implementation of our own program entitled "Ways and Directions of the Work of Commanders, Teachers and Instructors for Making the Training-Education Process. . . ." Naturally, the main factor in the implementation of all our ideas and plans is man--the performer on both sides of the "barricade" of theoretical knowledge and practical possibilities--the teacher (commander, instructor) and the student. Nothing could be accomplished and nothing could change matters and insure the future without the educator. Under our circumstances it is above all the scientific and educational training of the teachers, commanders and instructors that could raise aviation to the highest possible level. This has always been our starting point. . . .

Aviation Major General Dimitur Karadzhikov, deserving flyer of the Bulgarian People's Republic, chief of the Georgi Benkovski VNVVU, military pilot first class.

TEACHING METHODOLOGY AT 'VASIL LEVSKI' MILITARY ACADEMY SURVEYED

Sofia BULGARSKI VOIN in Bulgarian No 7, 1980 p 2

[Article by Major Milcho Tomov: "Individual Style of the 'Vasil Levski' VNVU [Higher People's Military Academy]"]

[Text] Once, as my assignment to the Vasil Levski VNVU was nearing its end, a platoon commander said: "Only young officers in the units may display creativity and autonomy. This is impossible in our case, in the school. My work is always controlled. I am in charge of only two types of training--drill and physical training. I was retained here, two years ago, being one of the top graduates. I regret not being a platoon commander in a battle unit. I could hardly develop here now."

I was flabbergasted by this statement.

I had to determine how the new approach was being mastered and asserted, and the way the ways and means for intensifying knowledge were being improved. All of a sudden, however, there was a problem: There was a platoon commander doubting his creative development not anywhere but precisely at the V. Levski VNVU. Was this not excessive? Could he transmit his feelings to his subordinate students? Yet he, Lieutenant Kostadinov, could extend his influence on two platoons. One of them is considered excellent. The company to which it belongs is also excellent. . ..

Together with the readership, let us think of what makes a chair commander dissatisfied.

Officer Aleksandrov commands a young collective of teachers with academic education, experience, and knowledge. This was confirmed at the competitive examination for enrollment in the school and in the course of their training at the G. S. Rakovski Academy. Logically, we should expect high results in the training of such teachers, the more so since conditions for their complete manifestation have been created.

No grades were given at the company tactical set of exercises for erroneous actions ("The students should not think of the grade but to develop their thinking," says Officer Aleksandrov. It is not a question of pointing

out an error but of "tricking" the enemy. The new circumstances require even firmer activities and a true creativity on the part of the student as a future commander. A simulator with several hundred targets has been designed which, combined, could create a variety of circumstances. The student must constantly and intensively think and improve his tactical outlook, the more so since this simulator (whose practical execution has unfortunately not been undertaken yet) includes a television system and a machine for automatic knowledge testing. No single class training could take place before the teacher has become convinced that the trainees are ready. This presumes an exceptionally secure and effective feedback which does exist in the school.

However, the results of tactical training are not steady: In the classes taught by Officer Kolev they are good whereas they vary in the classes taught by Officer Ivanov. Officer Aleksandrov is displeased. How is it possible for a 4.63 grade to "jump" to 5.31 and then "drop" again? What is the reason for the fluctuation? Could it be that Ivanov prefers to assign reports on class training only to the best trained students? To the fact that he develops their thinking while forgetting students with more limited possibilities? That he emphasizes the quality of training for its own sake even though the knowledge of some students is occasionally below the minimum? Or else that he is unable to work with students such as Angelov whose high school diploma shows a 5.75 average yet now he is always missing something, is always among the last. . . .

Control exercises are becoming more frequent and conversations with the teachers become tenser. A practical application must be found to the view that an examination is not a test of memory but, above all, of thinking. Reserves must be found. A mere change in the presentation of the subject is hardly sufficient. Lectures must be improved. The content of the subject is being inordinately repeated whereas also necessary is the type of additional information which would offer a broader tactical view. What about additional reference works? They are available. Are the students willing to study them? They are! Is an example needed? Last year one of the seniors had also delved in problems studied at the War Academy On a number of occasions he had confused his teacher. What about practical experience? . . . . Captain Kyankov does not engage in the petty supervision of platoon commanders in the course of field training. According to his instructions the trainees must be ready. When the platoon turns back to assume a reserve position, the captain hurls smoke bombs and explosives. The platoon commander is caught without a gas mask and is considered "dead." Captain Kyankov does not issue instructions but waits for someone to assume command. A new circumstance is created. It would be difficult to make a decision unless all students have considered in advance what they could encounter and how to oppose the "enemy." Yet, frequently this "enemy" has been sent by the instructors to provoke the reaction of the trainees.

Nevertheless, Officer Aleksandrov remains satisfied. High results are needed without which the young commander would be unable to train excellent platoons. For this reason he tightens the "screws." Organizational standard?! Few people know how to achieve it and even fewer how to make practical use of it. He went to the training department for help. He demanded, he insisted, he triggered arguments both among teachers and trainees. He was sure that something would come out of it in the way the idea was developed by trainees Lalov and Vladov of compiling all lectures, editing them, and publishing them as a textbook to help future students. This was also like the idea developed by Senior Sgt Tsonev on the pierced bullet ("Those are the people I like most. He developed this bullet, theoretically substantiated its advantages, and quite boldly went to the chief of the school and the other officers to defend his idea," Officer Aleksandrov says).

And, since we are discussing developments, let us add that in the other departments a number of trainees, along with mastering theoretical and practical knowledge, are participating in rationalization and suggestion groups. Since the beginning of the school year 95 suggestions have been received and only five of them have been refused; 30 percent of the participants in such developments are trainees. Senior Sgt Vreskov found out that one of the formulas on deformation of the distributor shaft, as presented in the textbook on internal combustion engines, was wrong. Guided by the teacher, he derived the accurate formula using two methods studied in the course on resistance of materials.

A number of developments prove the enriched scientific thinking of the trainees, proving that creativity is possible if the future commanders are given possibilities to express themselves.

Iron Hand and Necessary Minimum

After sharing with Officer Slaveyko Dimitrov the words of Platoon Commander Kostadinov (without revealing his name) Dimitrov categorically stated: "He may display his creativity as much as he wants in knowing his people, improving the work of the platoon, and raising its grade. He is probably doing nothing of the sort." (We already emphasized that one of Lieutenant Kostadinov's platoons is excellent. Therefore, he must be doing something--the author.) "There are many 'dead' souls among the commanders. I have attended a class in which the commander does not know that his platoon has a class-group exercise. He does not know how to organize his work. He may think of creative advancement. However, we cannot escape the program and the orders."

True, an iron hand is needed, for in addition to the necessary minimum of knowledge mastered by the trainees, in order for military education to be equal to civilian training in a corresponding area, they must study the theory of their command profession and test it in practice. Yet, there

are only 24 hours in a day. The program cannot be avoided. All this is impossible without strict discipline. There must be control. However, when control is the same, whether one is ahead or behind, could it be that sometimes the opposite effect results? Since April alone control exercises at the chair commanded by Officer Aleksandrov have totaled 27. Is there always time for the proper preparation of the trainees for such control exercises and for class-group training?

The school has a minimum grade for each subject. This is a grade which every trainee and teacher must secure. On the one hand, this minimum makes the teachers involve creativity in their work, to seek possibilities, and to maintain close and direct contacts with company and platoon commanders and work individually with the trainees, for their work as well is assessed on the basis of this minimum. On the other hand, could this minimum result in tolerance in terms of grading, or to raising grades? For example, covering one training on measurements requires 2 to 3 hours. The next day the teacher knows that the exercises have been made by some trainees superficially, for they have not had time. He grades them. Yet, what if this grade is below the minimum? The information goes to the computer and from it to the training department and... both teacher and trainee find themselves in a difficult situation. The question is discussed then of whether or not they could develop? Some teachers, in such cases, "inflate" their rating to save themselves unpleasantness. They are forced to accomplish this by the minimum and the subsequent control. "The developed teacher will never compromise with his conscience," Officer Dimitrov says. I agree with him. However, what happens when the trainee has not had time to prepare for the class-group exercise yet it is attended by a controlling officer from the school's administration? The teacher who knows (let me recall again the proper feedback) the load of the trainees and is aware of their homework would be tempted to call on the best students who will not shame him. In such a case, perhaps, the practice of Officer Ivanov of entrusting additional reports to the best prepared trainees may be justified....

As we may see, one problem dovetails another awaiting resolution. The minimum grade is still in its experimental stage at the Vasil Levski VNVU. The experience is as yet to be studied and the most successful method for increasing knowledge will be sought. If there is a search there must be errors. They are sifted out through practice.

A Few Thoughts On The Criterion

The teacher leaves the chair. He is promoted. One year later he is back to check on things and is displeased: "The trainees are ignorant!" The teacher has not taught them anything! However, the chief of the chair realizes that his former colleague is wrong. He has improperly rated one of the trainees which has led to erroneous conclusions concerning the teacher. A sharp argument develops. The former colleague throws his

weight around, shows his displeasure, and is angry.... And, nevertheless, reports his opinion.

Is this alienation from reality that results in forgetting age-old truths? Is this not a routine which prevents from seeing the new and properly assessing an action? Could this be ignorance? Let us not use such a strong word. However, it turns out that something similar--incomplete knowledge--may be found in many of the testers, whether or not we are willing to acknowledge it.

Officer S. is an able teacher in one of the chairs. Everyone knows this. The students respect and love him. After an investigation, however, the opinion of him on the part of senior commanders (above the chair level) changes. He has not "presented himself" properly! He has failed to attain the necessary minimum by...three percent!!! This is incompetence! the "diagnosis" has been made. Yet, many teachers in the same chair believe that it is the testing officer who diagnosed himself on the basis of his mediocre training. Commenting on this case, Officer Slaveyko Dimitrov stated to me that, "Had I commanded the chair where this teacher works I would have struggled against the commander who assigned such a tester."

Obviously, what he meant was that an even stricter course is needed to upgrade the knowledge of those who test as well, rather than of the teachers and the students only....

Perhaps this will be accomplished soon.

Therefore, the reason for our wish to share the searching and the problems faced by a school in promoting the creative development of the students, and for starting with the Vasil Levski VNVU, is because we truly find here rather interesting and particularly instructive features. We did not discuss the results of the scientific conference on improving the method for the preservation of scientific information aimed at enhancing the level of the training process to that of training-research work. We did not discuss the ties between the chairs and the other higher educational institutions, nor did we speak of the high level of developments and rationalizations. The search is continuing. This is the most essential feature of the work of this large collective. It is this search that leads to the discovery of still unused reserves....

COMMENT ON TRAINING IN MILITARY ACADEMIES

Sofia BULGARSKI VOIN in Bulgarian No 7, 1980 p 6

[Commentary by Lt Gen Mikhail Tsonev]

[Text] The authors of articles on military education have discussed a number of essential and interesting problems. Yes, this is indeed the case, our military-educational system has made its contribution to the national educational system. Also universally recognized is the fact that the level of scientific training in civilian higher schools and in higher military schools is virtually identical, that we have able and knowledgeable teaching cadres, and that training-material facilities, is, in general, on a modern level, a level which makes possible the practical application of knowledge, passing from theory through experimentation. As has been pointed out, a minimum passing grade has been established for the Vasil Levski VNVU [Higher People's Military Academy]. This is not used in other military academies. This experiment deserves particular attention. Perhaps it is mandatory to study it comprehensively and extensively, particularly in connection with the problems raised by the author of the article. Should the result be that instructors artificially raise grades to save themselves unpleasantness, and should the trainees fail to achieve their minimum, ways and means must be found, tried, and applied to improve the quality of the faculty and their moral development. However, I too think that a comprehensively trained instructor, a person who loves his profession, who has a proper pedagogical approach, and who can work individually and purposefully with the students, in accordance with the requirements of the BCP Central Committee Education Plenum, the first education congress, and the stipulations of the Ministry of National Defense, would be able to educate and train his students properly and achieve this minimum. We must not forget that grades depend not only on good or excellent results at the end of the year but on the way and extent of work with the teachers. Advancing their training, we are advancing the training of the students as well. In such cases there would be no individual cases, as those mentioned in the articles, of partial knowledge by the testers and, hence, incompetent evaluations of teachers and classes. In such cases every teacher will involve the students in scientific development.

One of the interesting questions raised is that of developing the organizational standard of the trainees. Each school has a plan for command-organizational qualities of students. Furthermore, all schools teach the subject of "Scientific Organization of Labor." It is possible that in some departments the comrades are still not clear as to what organizational standard means. It is also likely that in many departments teachers and commanders try to break down organizational standards into details, and consider the ways and means for its faster practical application which would help the students to adapt within a much shorter time to the units to which they have been assigned after graduation. I consider this a basic field for future work.

As to training-material facilities, as I already mentioned, they are organized on a high standard in our higher military academies. Naturally, here and there individual gaps may be found. For example, as a result of failure to develop a work method, the television training system of the students of the Georgi Benkovski VNVVU [Higher People's Air Force Academy] is not used entirely effectively. As to the simulator designed by the Vasil Levski VNVU, we have not received a request from the school for its making. Yet, funds to this effect are available. Our desire is to use them precisely where it is possible (and necessary) to create high effectiveness in training and the acquisition of knowledge needed in the practical work of the future commanders.

There are many problems worthy of consideration in the area of military education. They are related, above all, to improvements in the military training system in the light of the decisions of the BCP Central Committee Plenum on education, the decisions of the first education congress, and the instructions issued by Army General Dobri Dzhurov, minister of national defense. Currently we have the base on which the necessary training qualities are created and further developed in the students. Far more work remains to be done to mold the features and aspects of the character of the future officer making him both a comprehensively developed individual as well as a person not only of the present but of the future.

Editors' note: The creative work at the Georgi Dimitrov VNVAU [Higher People's Military Artillery Academy] will be described in a subsequent issue.

STATE OF HEALTH CARE, HYGIENE EXAMINED

Sofia ZDRAVEN FRONT in Bulgarian 16 Aug 80 p 1

[Report by Prof Dr Kol'o Gargov, deputy minister of public health: "Before the 12th Party Congress: Balance and Upsurge"]

[Text] Our party's congresses have always been preceded by the political and labor upsurge of the public health collectives throughout the country. Such is the case now as well, in the days and months preceding the 12th Congress. What was achieved in the Seventh Five-Year Plan? What remains to be done before the end of this year in order to fulfill all tasks? What will be the contribution of each public health collective or worker in honor of the congress? These are the questions which excite today the many thousands-strong army in white. This was also the topic of the open party meeting held on 8 August by the collective of the Central Administration of the Ministry of Public Health with the participation of Academician Radoy Popivanov, member of the BZNS [Bulgarian Agrarian National Union] Standing Committee, Prof Dr Kol'o Gargov, deputy minister of public health, and Candidate of Medical Sciences Dr Lyubomir Tomov, secretary of the establishment's party committee of the Ministry of Public Health.

The report submitted by Prof Dr K. Gargov contained a thorough and profound study of achievements in the Seventh Five-Year Plan. At the same time, unresolved problems were indicated in a spirit of criticism and exactingness.

The period from 1976 to July 1980 was a dynamic and fruitful stage in the development of public health in our country, the speaker stressed. The collective of the Ministry of Public Health may be proud of the fact that in 1979 infant mortality reached its lowest ever level--19.8 per thousand (compared with 23.1 per thousand in 1975). This decline continued in the first half of 1980. Naturally, we are aware of the fact that in some countries this indicator is under 10 per thousand.

Morbidity caused by a number of communicable diseases declined. Whereas in 1975 231.2 cases of measles, 400.8 cases of mumps, and 184.8 cases of dysentery were recorded per 100,000 population, the 1979 figures were

considerably lower: 2.8, 17.5 and 150.4 respectively. As a result of the implementation of the national program for labor safety and hygiene the number of workplaces consistent with hygienic requirements rose from 36.5 percent in 1975 to 64.8 percent in 1979.

Substantial positive changes also occurred in the organization of the health service. Let us point out, first of all, the growth of the Medical Academy as a major scientific, training, production, and organizational-methodical complex operating on the basis of modern standards. It already has a center for the treatment of the sick coming from foreign countries.

A total of 5,372 hospital beds, facilities for 10,696 children in nurseries, and facilities for 3,151 people in social welfare institutions were opened.

These and many other positive changes in the health care of the population and the health care system achieved in the Seventh Five-Year Plan were the results of the proper social policy of the BCP and of the country's government, and the efforts of the many thousands-strong army of public health workers.

Unfortunately, the conclusion that the disparity between the possibilities of the material facilities and the cadres, on the one hand, and the achieved results, on the other, has not been surmounted applies to the health care system as well. Overall population mortality is continuing to rise. This is due mainly to the aging of the population. However, we cannot fail to be alarmed by the increased mortality in the 40-59 age group. In order to reduce the general mortality rate possibilities must be sought in the 0-4 and 40-59 age groups. In the Eighth Five-Year Plan infant mortality could and should be reduced under 18 per thousand. This year we must preserve the trend of decline of this indicator. This calls for organizing special supervision over Tolbukhin, Silistra, Turgovishte, Sliven, Shumen and Kurdzhali okrugs.

The Eighth Five-Year Plan must become one of effective efforts aimed at reducing morbidity and mortality from cardiovascular, oncological and respiratory diseases, and accidents which deprive the active population of its life, health or ability to work.

Problems related to upgrading the national ability to work and of increasing the national amount of work time have risen sharply. Despite the relatively good indicators of temporary or permanent disability, compared with other countries, possibilities remain to reduce labor losses caused by illness. The task is to seek them adamantly and make full use of them. This demands a great deal of effort on the part of all Ministry of Public Health units and the entire health network. The economic aspects of such activities are exceptionally important. That

is why the further improvement of the health service offered the workers, the more effective solution of sociohealth problems in protecting the workers' health and insuring objectivity and precision of medical labor evaluations remain our primary task.

Another direction in our activities is to save to a maximum extent outlays of public time (ours and of the citizens) in the course of providing health services. Despite recent accomplishments, unnecessary time continues to be wasted through various channels: waiting in polyclinics, sending citizens to various pharmacies and to unnecessary examinations and tests, and so on. Priority is not always given to people engaged in production work. Many medical activities are carried out at the expense of the public rather than the private time of the citizens without the presence of health or social indications.

Prof Gargov then discussed the problem of organizing the health care system on an economic basis. The application of the economic approach in health care, said he, should be such as to insure the optimum consistency between the considerable growth of the material and technical base and cadre resources and the most favorable values and trends of the indicators of the population's state of health; it should promote individual and collective interest in the effective utilization of allocated funds for health care; it should increase the incentive of public health workers to improve their skills; it should upgrade the interest of the state institutions and economic organizations and their participation in the creation of better working conditions, upgrading the effectiveness of general and specific preventive measures and lowering worktime losses caused by disability. It is expected that in September 1980 the Council of Ministers will pass a decree and ordinance on improving the management of health care and social welfare.

The normative base must be mandatorily improved. We must review and reassess the various norms and standards and upgrade them in accordance with the changes which have taken place and with the application of scientific and technical progress and the economic approach.

We must pay particular attention to the program-target approach in our work. The organization, standards, and quality of outpatient-polyclinical services, the enhancement of the health standards of the people, the further development of the care for the health of the workers and the students, the expedient use of mineral waters, and so on require long-term programming.

Prof Gargov then indicated some topical tasks related to the implementation of the Seventh Five-Year Plan and the plan for 1980:

By the end of the five-year plan the number of hospital beds must reach 81,000. On 30 June they totaled 79,322. In other words, facilities for 1,678 beds must be provided before the end of the year;

Places in nurseries must total 83,500. By the end of the year the largest number of places must be made available in Sliven Okrug--275; Ruse Okrug--250; Veliko Turnovo--215; Yambol--210; Varna--[illegible] and others;

The number of places in social welfare institutions must reach 20,800. By the end of this year another 774 places must be made available in a total of 14 okrugs (200 in Silistra, 90 in Vidin, 70 in Vratsa, 60 in Gabrovo, Kyustendil, and Sliven each) and so on;

The Seventh Five-Year Plan called for about 350 million leva in capital investments. Over the past 4 years 79 percent of these funds were used. Premises were built for the okrug hospitals in Kurdzhali, Stara Zagora and Sofia, and for the rayon hospitals in Panagyurishte, Svishtov, Botevgrad, and Malko Turnovo; the vocational diseases clinic of the Medical Academy, the polyclinics in Tryavna, Kazanluk, Lyaskovets, Sevlievo, Pleven, Silistra, and others. The 1980 plan called for investments totaling 60,492,000 leva; in the first half of the year 21,568,000 leva (35.7 percent) were invested. The construction of the additions to the polyclinic block and the building for intensive therapy of the Pirogov Institute, the therapy block of the Higher Medical Institute in Varna, the Hygiene-Epidemiological Institute in Plovdiv, the polyclinic in Maritsa, and the nurseries in Sliven, Mikhaylovgrad and Trudovets have fallen behind dangerously (less than 10 percent fulfillment of the annual plan).

Every manager and every collective, the speaker stressed, should now study the implementation of the Seventh Five-Year Plan and the stipulations of the Main Objectives and Basic Tasks of Health Care and Social Welfare for the 1979-1980 Period and update measures for their full implementation before the end of the year.

Following the report, representatives of the individual directorates read the pledges adopted by their collectives in honor of the 12th Party Congress. Following are excerpts:

The Population Medical Services Directorate pledges:

To upgrade the effectiveness and raise even higher the quality of medical services, focusing its efforts in the following basic directions: protection and strengthening the health of those who are healthy; early discovery of individuals threatened with or suffering from mass or problem diseases; effective and comprehensive outpatient-polyclinical treatment of patients; timely recovery of the disabled or those threatened with disabilities;

In 1985 the average number of visits to physicians should reach 7.2 per capita; house calls should reach 0.7; the percentage of outpatient visits, 43; and dental checkups, 2.5 per capita;

Infant mortality must decline below 18 per thousand; the percentage of children and students treated on an outpatient basis must be raised to 95 percent while that of pregnant and nursing women to 86 percent.

Planning and Health Care Economics Directorate:

By the end of the Eighth Five-Year Plan the basic indicators for meeting the population's requirements for medical aid must reach the following level: hospital beds, 97.8 per 10,000; beds in sanatoriums, 23.7 per 10,000; places in permanent nurseries and DMD, 21.4 per 100 children under the age of 3; places in social welfare homes, 27 per 10,000 population; physicians, 27 per 10,000 population; and dentists, 6 per 10,000 population.

Cadre Management and Labor Directorate:

Active participation in the formulation and development of a new effective structure and technology for the management of health care and social welfare;

Study and discussion of the possibility for the creation of state-public organs for managing health care and social welfare in okrugs and settlement systems;

Integrate activities and coordinate planning, implementation, and reporting of organizational-methodical aid provided by republic, okrug and rayon specialists and method workers, and others.

Social Welfare Directorate:

Total implementation of the Seventh Five-Year Plan for providing places in social welfare institutions, reaching the level of 23.4 places per 10,000 population;

For the Seventh Five-Year Plan reach a 44 percent employment of disabled individuals;

Train in the 1980/1981 school year in industrial enterprises and vocational schools 900 disabled people, thus raising the number of retrained people in the five-year plan to 4,500.

SANITARY CONDITIONS IN FARMYARDS REVIEWED

Sofia ZDRAVEN FRONT in Bulgarian 16 Aug 80 p 3

[Article by Dr Tsvetan Lazarov, head of the Communal Hygiene Section: "The Sanitary-Hygienic Condition of Farmyards"]

[Text] The proper hygienic condition of farmyards in APK [Agroindustrial Complexes] is of definite significance in terms of the health of farm workers, the quality of the food products (milk, grain, and others), and the hygiene of settlements.

We conducted a study of all farmyards in the okrug (120) to determine their precise condition and the possibilities for their development.

What did our findings indicate?

In terms of the sanitary-protection distance from the settlements, only 33 percent of the farmyards are consistent with hygienic requirements. A total of 104 farmyards (86 percent) are located in the leeward side of the settlements. Yet, we know that farmyards closer to settlements, particularly those located on the leeward side, adversely affect the settlements.

The conlusion was reached that about one-half of the farmyards cannot be developed further. In the future the efforts should be focused on the building of warehouse bases, workshops, bases for agricultural equipment and industrial activities, and so on.

General construction plans have been drafted for no more than 18 farmyards while plans for their urbanization and hygiene, for no more than 30.

The urbanization of farmyards has been unsatisfactory both in terms of fencing and landscaping them and the treatment of animal waste.

One-third of the investigated farmyards are fully fenced. They have esthetically pleasing and well maintained fences. About one-half are

partially fenced while 13 percent are not fenced at all. Worse in this respect are the farmyards of the APK of Borovan Village while the best were the farmyards in the APK in Byala Slatina, the scientific production complex in Knezha, and others.

The landscaping of the farmyards with grass and trees and shrubs has been underestimated. Only a small percentage of them have been landscaped (the APK in Byala Slatina and the scientific production complex in Knezha).

Roads are another important factor in the overall urbanization of farmyards. Observations have indicated that the developed road network is maintained unsatisfactorily. The worse in this respect are the APK in Roman and Gabare.

The treatment of animal waste is a problem of major hygienic significance. Unfortunately, no single APK has built treatment facilities for liquid manure. Usually, the manure is collected in cesspools most of which are in poor hygienic condition (they are not regularly cleaned, they overflow and swamp the surrounding area in the farmyards, a considerable number of them are uncovered, and so on.

The cesspools in the farmyards of the APK in Vratsa, Roman, Gabare, Borovan, and others are in poor hygienic condition. Most farmyards have specific solid animal waste manure areas. Many of them, however, are not properly used. The waste is not removed regularly but is scattered over a large area in the farmyards (the APK in Miziya, Vratsa, Gabare, Roman).

Water supplies in the farmyards is an exceptionally important hygiene problem. Most of the water comes from water mains and the water is decontaminated and subjected to systematic sanitary and laboratory control. A considerable percentage of the farmyards, however, have their local water supply sources (wells, dams, and others) which do not meet hygiene requirements. They have no protective areas. The water is not decontaminated. Its quality is not periodically tested, and so on. This creates a serious threat for the outbreak of epidemics, for the same water is used in milking. Frequently local water sources are being built in farmyards without the preliminary testing of the water.

A great deal remains to be desired in improving the amenities of the working people, particularly in animal husbandry. The problem has been properly resolved at the scientific production complex in Knezha, the APK in Krivodol, and others. However, current maintenance is unsatisfactory in 70 percent of the residential premises. Only 19 baths have been built for the livestock breeders and other farmyard personnel.

The main conclusions drawn on the basis of the investigation were the following:

On the one hand, the good hygienic and urbanization condition of a number of farmyards of the APK in Byala Slatina and the scientific production complex in Knezha. This, unquestionably, has a positive effect on the health of the working people and the hygienic condition of the settlements;

On the other hand, most farmyards are unsatisfactory. There are no long-range plans for their development, urbanization, and hygiene. Basic problems of hygiene are not being resolved properly, such as water supplies, storage and utilization of solid and liquid waste, the creation of proper living conditions for animal husbandry men, and others.

After informing the administrative councils of the APK and the executive bureau of the okrug agroindustrial union of the basic conclusions on the hygiene and urbanization condition of farmyards, the efforts have been forcused on the following:

The creation in the Eighth Five-Year Plan in all APK no less than three model farmyards from the hygiene and urbanization viewpoints, to be used as models of leading experience;

Applying hygiene requirements in all farm enterprises in settlement systems and settlements scheduled for development as model hygiene and urbanization centers;

Applying hygiene norms and requirements to local water sources used in farmyards;

Organizing the socialist competition among agroindustrial complexes on problems of urbanization and hygiene of farmyards.

The reaching of decisive successes in the implementation of these tasks will have a beneficial impact both on the health condition of farm workers as well as the overall hygienic and urbanized aspect of the settlements.

NUTRITION PROBLEMS, PROSPECTS DISCUSSED

Sofia ZDRAVEN FRONT in Bulgarian 16 Aug 80 p 3

[Article by Dr Todor Dobrilov, head of the Nutrition Hygiene Section, Vratsa Hygiene Epidemiological Institute: "Nutrition--Problems and Prospects"]

[Text] Recently we studied the organization of nutrition of farm workers, and the material facilities and hygiene in APK [Agroindustrial Complexes] and NPK [Scientific Production Complexes]. Several major omissions were noted, as follows:

The agricultural personnel receive their food from 70 permanent cafeterias with kitchens, 9 seasonal cafeterias, and 4 permanent take-out cafeterias and, in the summer, 23 take-out cafeterias set up in the fields. Cafeterias for farm workers were found in only one-half of the okrug's settlements.

The nutrition provided is not consistent with physiological norms. Last year only 2.1 percent of the workers were served breakfast; 16.2 percent were served lunch; snacks (before or after lunch) were served to 0.95 percent; dinners were served to 2.1 percent and a nightime snack was served to 0.4 percent.

Free food was given to 676 workers. All personnel attached to the cafeteria were given food price discounts ranging from 20 to 30 percent.

All cafeterias are supplied with products separately, mostly once or twice weekly. Supply difficulties exist in terms of some products and because of lack of transport facilities.

Only 24.4 percent of the cafeterias had a weekly menu and only 16.7 percent observed it.

The qualifications of the kitchen personnel are very low. Only 9 of the 257 cafeteria workers are graduates of public catering technical schools. Nearly one-half have grammar education and have attended courses for cooks or assistant cooks while the others have no special training whatever.

The managements of farms, trade union committees, and people's control commissions do not systematically check the work of the cafeterias. In the APK of Byala Slatina, Miziya and Gabare and the NPK in Knezha not a single investigation was made in the first 9 months of 1979.

Material facilities in farm cafeterias are considerably behind compared with the okrug's public catering institutions, as follows:

In a number of places the cooking and sitting areas do not meet sanitary requirements;

The level of the kitchen equipment is low. Refrigerated facilities are insufficient in one-half of the cafeterias. In a number of places facilities for handling the products are insufficient.

The materials from the study of the feeding of farm workers were submitted for consideration by the executive committee of the okrug people's council. It was decided that the Hygiene Epidemiological Institute, together with the okrug agroindustrial union and the okrug trade unions council will draft a program for the 1980-1985 period.

Last March the executive bureau of the okrug agroindustrial union adopted the suggested program for expanding cafeteria services to farm workers and the development of auxiliary farms of APK and NPK in Vratsa Okrug between 1980 and 1985. It stipulates the following:

Adoption of measures for mass cafeteria feeding and for improving the nutritional system of farm workers;

Improving the management and control of cafeterias and upgrading the skills of kitchen personnel;

Improving the transportation, supply, and material facilities of cafeterias.

Investigations conducted at the beginning of the intense field work indicated that the measures taken by the APK and NPK managements for the implementation of the program are already yielding their initial positive results:

A new cafeteria is under construction in Galovo Village. The reorganization of cafeterias in Kozloduy, and Banitsa and Brenitsa villages has been completed;

The current state of hygiene of the cafeterias has shown improvements.

Against the background of such unquestionable successes, the unsatisfactory attitude and lack of interest displayed in the problem of the nutrition of farm workers in the Krivodol APK, whose chairman is Blagoy Kirilov, stands out as a dark spot. The investigation here revealed that the reconstruction of the cafeteria in Baurene Village was stopped. After the cafeteria in Kravoder was closed down for reconstruction, the food served the workers of the branch farm was cook in two trailers whose state of hygiene was very poor. Despite the desist order, the cafeteria in Lesura Village continues to serve food to over 100 mechanizers even though its state of hygiene is unsatisfactory. Nutrition workers without health cards have been hired.

The okrug agroindustrial union must strictly take to task the APK chairman in Krivodol who, only 3 months after personally voting in favor of the adoption of the program, very rapidly forgot its existence.

FUTURE TASKS OF ACADEMY OF MEDICINE OUTLINED

Sofia ZDRAVEN FRONT in Bulgarian 23 Aug 80 pp 1-2

[Report by Prof Dr Atanas Maleev, Academy of Medicine corresponding member, BCP Central Committee member, first deputy minister of public health and president of the Medical Academy: "To New Successes With New Measurements!"]

[Text] As reported in the previous issue, the administrative, party and trade union aktiv of the Medical Academy met on 13 August. The meeting dealt with the main tasks of the academy based on the decisions of the July 1980 BCP Central Committee Plenum.

In his report at the meeting corresponding member Prof Dr Atanas Maleev stressed that the 29 July 1980 BCP Central Committee Plenum gave a positive assessment to the accomplishments of the first 4 years of the Seventh Five-Year Plan. The national income generated is about five billion leva higher compared with the Sixth Five-Year Plan. In the Sixth Five-Year Plan a one percent increase in the national income equaled 91 million leva; in the first 4 years of the Seventh Five-Year Plan it equaled 132,400,000 leva. In the first 4 years of the present five-year plan alone capital investments were made totaling 2.2 billion leva more than the overall amount of capital investments in the entire Sixth Five-Year Plan. There has been a considerable increase in the population's real income which averaged 1,186 leva in 1975 (the last year of the Sixth Five-Year Plan), and over 1,300 leva in 1979. Between 1976 and 1979 278,000 new housing units were built. All this indicates that we have sufficient reasons to be pleased with our accomplishments.

At the same time, the party's Central Committee noted the still existing many weaknesses whose elimination requires urgent measures. The main weakness to be surmounted as soon as possible is the disparity between the possibilities of the developed material and technical base and its inadequate and inefficient utilization. This basic weakness particularly applies to health care, including the Medical Academy.

The urgent task now is to insure the fullest possible utilization of the three elements of the production process--labor tools, labor objects, and manpower. For example, assessing, on the one hand, the funds spent in our country per patient for the different diseases, and, on the other, the modern possibilities and requirements of the science of medicine, we would see that this fully applies to the health care system as well.

Science is still not properly related to production and has not become a direct productive force. No sufficiently good system exists for providing prompt information on scientific and technical achievements and leading experience. Our scientific institutes must surmount red tape and bureaucracy and become factories for scientific products, factories producing scientific "commodities." It is a question not only of their own developments but of the utilization of foreign experience. The task has been formulated entirely clearly and our scientific activities must become free from all elements of bureaucracy in the practical utilization of the latest achievements of the science of medicine.

After that, corresponding member Prof Dr Atanas Maleev pointed out the problems to be resolved before the end of 1980: An assessment must be made of the implementation of plans so far and all the necessary measures must be taken so that no single collective will have failed to fulfill its Seventh Five-Year Plan; special attention must be paid to the work in August when a considerable number of management and performing cadres are on leave; in September a plan must be drafted on the activities of the Medical Academy in 1981-1982; the party leadership of public organizations must be improved and their active inclusion in the implementation of forthcoming tasks insured; public health collectives and the individual health workers must be informed of all problems and tasks.

The speaker then discussed in detail the basic tasks of the Medical Academy in the Eighth Five-Year Plan--the five-year plan of technical progress and intellectualization.

The task set by Comrade Todor Zhivkov of raising labor productivity not by percentages but by a factor of 2-3, or more applies to health care as well. It is on the basis of this requirement that we must consider and resolve our problems. Unquestionably, very precise programs will have to be elaborated for some basic indicators such as reducing labor losses caused by disease, morbidity, and mortality, economizing on equipment, funds, and so on. They must emphasize the application of the new economic mechanism in our work.

In the Eighth Five-Year Plan we must upgrade labor productivity through the application of technical progress and intellectualization in medical activities by reducing diagnostic time, treatment time and the stay of technicians in hospitals, and the length of sick leave, by improving the end results of the patients' treatment.

What examples could be cited on the various types of medical help?

In the field of oncology, according to the current method for diagnosis and treatment, only 20 percent of those suffering from stomach cancer are considered operable. Obviously, the task in the Eighth Five-Year Plan will be to raise the figure to 30-40 percent. Also rather low currently is a percentage of operable cases of lung cancer--only five percent. In the Eighth Five-Year Plan, as a result of prompt diagnosis, operability must reach 15-20 percent in all cases of pulmonary cancer. We must considerably upgrade the percentage of operability in intestinal and breast cancers, and so on.

In surgery, we could justifiably demand a lowering of postoperative complications from 10-15 percent to 5-6 percent; a reduction of mortality as a result of surgery by one-half through the application of new methods and technologies; reducing the amount of anesthetics, and so on.

In urology the problem of introducing new methods in prostatectomy has been urgent for some time. In the current methods used in our country the patient must remain bedridden 3-4 or, sometimes, more weeks, compared with usually no more than one week with the new methods. Another urgent problem is that of kidney transplants. The health and economic results of this type of medical help are obvious. However, the new Transplants Center has still not begun to operate as it should.

A number of possibilities exist in the field of ophthalmology for reducing the length of treatment, improving treatment results, outpatient instead of bed treatment of patients, and so on. However, we must apply far more extensively the method of laser coagulation which enables us to treat a number of eye diseases which previously required surgery. This reduces the risk of surgery and improves the effect of the surgery and reduces the length of hospital treatment.

In the field of cardiology mortality from infarct of the myocardium has been lowered to 20 percent. However, should we be satisfied with this or set ourselves the task of lowering it to 10 percent in the Eighth Five-Year Plan? Here is another problem: Reducing the extent of disability of infarct victims through the application of modern recovery methods aimed at reducing the visibility time from 6 to 3-4 or, in some cases, 2 months.

Let us consider gastroenterology as well. Here we have powerful means such as endoscopy and ultrasound diagnosis. We have the possibility to considerably shorten the time for diagnosing tumors and diffusion diseases of the liver and the pancreas and, hence, providing more timely and adequate treatment. We can shorten (from 30-45 to 15 days) the time for the treatment of ulcers through the use of new medicinal means;

thanks to achievements in the field of immunology we can provide differentiated treatment to patients suffering from chronic liver diseases, and so on.

Hygiene. There is no other area in which the achievements of scientific and technical progress find and should find such extensive application. We must extensively apply new methods and equipment to determine environmental pollution, improve the hygiene of the working environment, reduce morbidity caused by a variety of vocational illnesses, and so on.

We must very seriously consider the application of new methods in the field of dentistry. The fact that after we developed the complex adapta equipment set other more expensive instruments were used is unexplainable. We must also resolve the problem of the ratio between dentists and dental nurses, and so on.

What should be the end results of all this?

First: Reduce the amount of labor day losses caused by temporary incapacity and permanent disability.

Second: Reduce infant mortality even more sharply (by five percent or more!).

Third: Increase the average life span by 2 to 3 years compared with the current level.

Fourth: Insuring effective and factual rather than formal and "quantitative" outpatient treatment through the application of technical progress.

Fifth: Applying proper hygiene standards for work in plants, mines, schools, establishments, and others.

How will all this be achieved?

Before the end of October 1980 we must report on the fulfillment of the obligations we adopted in relation to the National Party Conference and the BCP Central Committee Politburo decision on upgrading the effectiveness of the medical science and the training of medical cadres;

All institutes must formulate clear prospects for the development of their respective disciplines in the Eighth Five-Year Plan--the equipment they will be needing, its expected effectiveness, the sequence in which it should be purchased and applied, the cost of the new apparatus, and so on. Henceforth, the funds at our disposal will be allocated in accordance with the positive changes which will occur in diagnosis, treatment, and so on, in a given area;

The medical cadres must steadily upgrade their training and knowledge and properly master the new apparatus and new methods. We must particularly emphasize the problem of intellectualizing our activities. We must regulate the right to release those who are unwilling to learn or to apply new methods and new equipment. We must eliminate the complacency noted among some of our cadres who, having become assistants, docents, senior scientific associates, and so on, consider that they should no longer grow.

We must develop the type of approach for the upgrading of cadres according to which everyone will be rated on the basis of the way in which he applies scientific and technical progress in his activities. Cadres unwilling to march in step with modern requirements in the medical academy should, obviously, be released;

We must give serious thought to the following question as well: Why is it that every year we send hundreds of patients to be treated abroad? The time has come to assess the activities of the respective specialists based on the number of patients sent abroad for treatment.

In connection with upgrading the cultural and quality standards of medical services, corresponding member Prof Dr Atanas Maleev seriously raised the question of the two-step servicing of patients. This matter is both underestimated and misunderstood. Actually, we cannot speak of the intellectualization of our work all the time that not nurses but medics take care of the patients;

The overall revision and proper solution of problems related to the number, selection, and training of cadres--physicians, dentists, registered nurses, dental technicians, and so on--is necessary. We must also review the norms governing the availability of beds and their level of utilization, the sanatorium facilities, and so on;

Measures must be taken to insure that the labor effectiveness based on the application of the achievements of contemporary medicine and scientific and technical progress are reflected on the wages of the corresponding specialists. Cadres which apply new and effective developments should be encouraged morally as well by promotions, award of titles, and so on. We must seriously consider the factual value of topics and development of candidate dissertations, rationalization suggestions, and others, a considerable percentage of which are valuable to their authors alone rather than to practical work at large.

The following spoke on the problems raised in the report: Prof Dr F. Kaloyanova, doctor of medical sciences and director of the NIKhPZ [Scientific Research Institute for Hygiene and Occupational Diseases]; Prof Dr L. Shindarov, director of the NIZPB; Prof D. Danchev, dean of the School of Pharmacy; Prof Dr El. Paneva, chairman of the academy trade union

committee; Docent Dr D. Nenov, deputy rector of the Higher Medical Institute in Varna; Prof Dr Sh. Nin'o, doctor of medical sciences and director of the NIP; Dr Ognyan Ikonomov, secretary of the Komsomol Academic Committee; and Prof Dr K. Popov, deputy dean of the School of Dentistry in Sofia.

Supporting the basic stipulations, assessments, and conclusions contained in the report, the speakers emphasized the readiness of the collective they head to creatively implement the instructions and welcomed the 12th BCP Congress with new and even greater successes in medical science and practice--successes which will be assessed on the basis of new criteria and measurements in the Eighth Five-Year Plan.

POOR QUALITY OF DENTISTRY CRITICIZED

Sofia ZDRAVEN FRONT in Bulgarian 23 Aug 80 p 4

[Article by Dr Mladenka Dimitrova, chief inspector at the Sofia City State and People's Control Committee, and Dimitur Dimitrov, inspector at the Sofia City State and People's Control Committee: "Organization of the Work in Dental Laboratories in Sofia"]

[Text] The Sofia City State and People's Control Committee and the NZSG [Public Health and Social Welfare] Administration and the Permanent Public Health Commission of the Sofia People's Council investigated the organization of the work of dental laboratories in the capital in terms of the qualitative and prompt manufacturing of artificial dentures.

As a result of the efforts made in recent years the NZSG Administration of the Sofia People's Council successes were achieved in the prompt and high quality manufacturing of artificial dentures. On the basis of the Ministry of Public Health norms Sofia's requirements for dental technicians have been met 100 percent. This is a guarantee for improving the organization and quality of the work in dental laboratories. It is a prerequisite for considerably shortening the time needed for the manufacturing of artificial dentures. However, it has not as yet adequately influenced their quality improvements.

Both dental technicians and dentists are to be blamed for substandard work. The impressions taken are substandard, with bubbles, missing pieces and improperly molded working impressions and the use of unsuitable materials for pontic crowns made of plaster without a preliminary anular abscission [apsustiran] or else with the use of silicone.

Denture areas are poorly prepared with improper filing of the bridge holders and unprepared natural teeth for partial dentures. In many cases the teeth have not been leveled. The area of the plate is not determined in advance in making the first impression for a full plate. This hinders the making of high quality individual trays by the dental technician. The A-line is not established intraorally by the dentist so that the valval area may be closed most precisely, letting the dental technician accomplish this arbitrarily.

The relief chambers are not delineated. Frequently, even if delineated, they are not coordinated with the shape of the torus.

The items made by dental technicians frequently include poorly cast models with air bubbles, and broken and glued parts. Some of the crowns are shorter, longer, or wider and are not always consistent with functional and medical-biological requirements.

The principles governing the manufacturing of bridges are violated. The middle cast parts have a wide chewing surface. Articulation with the opposite teeth is poor and the bridges are not connected with the supporting crowns in a straight line. No leveling is practiced in arranging the teeth for full or partial plates and blockings are not eliminated. The edges of the dentures are not preserved, particularly in the area of the paratuberal spaces, which lowers the functional qualities of removable dentures. In partial dentures the hooks may be poorly bent, placed low and with unfiled and unsafe points. The rules of polimerization technology of plastics and the proper recrystalizing of the crystal grid of the metal are not always observed.

Such weaknesses in denture work are the result of the insufficient training of dentists and dental technicians and the reduced exactingness of the managements of dental polyclinics. Fifty percent of the dental technicians working in the capital have less than 5 years practical experience. Insufficient care is taken to upgrade their skills. The possibilities of the sponsorship movement are not being fully used. Few dental technicians are assigned to attend courses at the School of Dentistry of the Medical Academy.

The official brigade organization of labor (with individual work records) adopted by the laboratories does not promote the desire and interest of the entire brigade to work well--to upgrade its dexterity and professional skills. There is no incentive for reasonable savings since no intracost accounting is used.

Coordination between dentists and dental laboratories is not properly organized, as a result of which the patients are not informed on time as to the day and hour of their second visit. The completion of artificial dentures is delayed also by the continuing failure to date the cards despite the instructions contained in the order of the NZSG Administration of the Sofia People's Council.

In order for artificial dentures work in the capital to be improved, the Sofia City State and People's Control Committee has made it incumbent upon the NZSG Administration of the Sofia People's Council to implement a number of measures aimed at improving the organization of the work in dental laboratories and improve the quality of artificial dentures.

BRIEFS

STOYCHEV ACTIVITIES--A new housing construction combine has been commissioned in Varna Okrug. It is the latest and largest plant for prefabricated construction materials. Each 75 minutes of the day the conveyor belts of the plant produce prefabricated material for one apartment. The commissioning ceremony was attended by Todor Stoychev, candidate member of the BCP Central Committee Politburo and first secretary of the Varna Okrug Party Committee. He pointed out that this new achievement is one more genuine expression of the implementation of the party's socioeconomic program. Ivan Sakarev, minister of construction and building materials, read a state council decree on awarding various workers in the collective who participated in the planning and construction of this plant. [AU040955 Sofia Domestic Service in Bulgarian 1900 GMT 3 Sep 80]

STOYCHEV OPENS CHEMICAL PLANT--In honor of the forthcoming 9 September holiday, four days before its celebration, one of our largest chemical plants was commissioned in Devnya, Varna Okrug. Todor Stoychev, BCP Central Committee candidate member and first secretary of the Varna Okrug Party Committee, inaugurated the plant a few hours ago. The festive meeting was also attended by Georgi Pankov, minister of chemical industry, Ivan Sakarev, minister of construction and building materials, by Soviet diplomats accredited in Bulgaria and by numerous local leaders and officials of the Okrug. [AU040955 Sofia Domestic Service in Bulgarian 0900 GMT 4 Sep 80]

PEACE PARLIAMENT DELEGATION--At the National Assembly Hall in Sofia, a public meeting took place on 4 September at which the Bulgarian delegation for the forthcoming World Parliament for Peace was elected. Comrades Pencho Kubadinski, Petur Tanchev, Andrey Lukanov, Vladimir Bonev, Misho Mishev, Nacho Papazov and leaders of mass organizations and creative unions attended. The meeting approved the proposed delegation which includes comrades Pencho Kubadinski, chairman of the National Preparatory Committee for the World Parliament for Peace, Lyudmila Zhivkova, Tsola Dragoycheva, Dimitur Stanishev, Misho Mishev, Vladimir Bonev and Nacho Papazov. [Sofia Domestic Service in Bulgarian 1730 GMT 4 Sep 80]

USSR TRADE MINISTER--Andrey Lukanov, deputy chairman of the Council of Ministers, received Boris Stepanovich Gordeyev, deputy minister of foreign

trade of the USSR and Suren Sarukhanov, deputy minister of trade of the USSR. They discussed questions concerning the expansion and intensification of trade and economic relations between the two countries and the implementation of the contractual deliveries on the basis of the exchange of goods protocol for 1980. The meeting was attended by Khristo Khristov, minister of foreign trade and by Valentin Dyakov, USSR trade delegation to Bulgaria. PROMINENT CZECH DISSIDENT CHOOSES EXILE

Frantfurt/Main FRANKFURTER ALLGEMEINE in German 5 Sep 80 p 25

[Article by -hpr-: "Exodus From Prague"]

[Text] Jiri Lederer has given up. The prominent Prague newspaperman, who spent years in jails and nevertheless remained steadfast in his convictions, has emigrated to the FRG. At last the Prague authorities had found a means of exerting pressure on him to which he could offer no resistance. They threatened to withdraw his Polish wife's residence permit in the CSSR, intimating that it might take as long as 4 years to reunite the family. So the family capitulated and applied, as the authorities had hoped, for an exit permit, which, as is usual, was quickly granted. Now the Prague Ministry of the Interior can cross out another name on its black list and thereby weaken the resistance against the Husak regime. Like perhaps nobody else Jiri Lederer knew how to document the resistance, especially of writers. His "Czech Conversations" with the country's leading authors, many of whom have also gone into exile in the meantime, reveal the motives which kept these intellectuals from giving up and gave them sterngth to go to jail for their convictions. Now this too belongs to Lederer's past. Last time, in 1977, together with Vaclav Havel and others, he was sentenced to 3 years in jail, partly also because the above-mentioned book published in the FRG, which at the time of his conviction was only in the form of a manuscript. Some people have wondered why Lederer was refusing to accept the offer by the state security authorities to set him free if he left immediately: because it might have been interpreted as an indirect admission of guilt. Vaclav Havel, to whom authorities have made the same immoral proposal, has taken the same position as Lederer. He too remains in jail, under aggravated conditions, but unbroken. Such an attitude cannot but raise unlimited respect even with the expectation that the ultimate end will be emigration. The list of individuals driven from the country is steadily growing and includes prominent names such as that of the writer Pavel Kohout but also of unknown workers such as that of Jan Seba. They all went into exile under pressure even though some of them have formerly applied for an exit permit themselves. In this manner the Prague regime hopes to solve the problem of critical intellectuals. But like Lederer, all newcomers into exile report that those who remain, while depressed and occasionally despairing, are not capitulating. The semi-legal publishers such as "Edice Petlice" continue to publish and even the Charter 77 movement, though weakened, has not been crushed. By showing up the fate of those who remained people like Lederer, who is starting his hard life in exile, remind us that, sometimes, we forget too fast.

'TRIBUNA' GIVES DEFINITION OF 'PRESENT-DAY REVISIONISM'

Prague TRIBUNA in Czech No 36, 3 Sep 80 p 2

[Article by Ladislav Hrzal" "The Leprosy of Revisionism"]

[Text] Marxism-Leninism strengthens and develops itself primarily through ideological struggle with its enemies. It fights revisionism especially in evaluating new phenomena in social life and in the development of the workers' movement.

Revisionists present themselves very often as creative Marxists. V.I. Lenin exposed their "creative" approach to Marxism. Since the inception of their work inside the workers' movement, the revisionists have concentrated their "creative" activity on deflating the revolutionary content of Marxism, ignoring the general laws of society and denying the generally valid and validated laws of revolutionary class struggle.

Contemporary revisionist, too, revises and falsifies and tries to deform all aspects of Marxism-Leninism. A scientifically justified critique of revisionism is a necessary prerequisite for the present ideological struggle and is an important part of the communist education of all working people. We must also add that revisionism cannot be defeated once and for all. As long as capitalism exists there will exist socioeconomic and class conditions permitting the repeated emergence and influence of opportunism and revisionism within the workers' movement. Revisionism is an international phenomenon even if it appears in concrete cases to be related to the specificities of this or that country. This specificity of revisionism, which was exposed and scientifically analyzed by V.I. Lenin, is fully demonstrated in the current conditions of the international workers' movement.

Marxists-Leninists are fighting a united front of international revisionism and opportunism encompassing rightwing revisionists, centrists and left-wing revisionist and "heroes" of the revolutionary phase. Although they differ one from another in methods, forms and other peculiarities which cannot be ignored in our criticism, all revisionists agree in their attacks launced from their varied positions on the same anticommunist and anti-Soviet platform. They have one common goal: to undermine the unity

of the international workers' movement as well as the unity of the communist parties in the socialist countries.

V.I. Lenin was the first Marxist in the international workers' movement who was fully aware of the danger of revisionism and opportunism for the workers' movement. He exposed their socioeconomic and ideological-political content, their class and intellectual roots, their function and historic place in the struggle between the bourgeoisie and the proletariat. Through his consistent struggle with revisionism, Lenin served as an example to all communists. He proved in theory and practice that it was impossible to be conciliatory toward the smallest manifestation of renegade activity and toward the attempts to smuggle bourgeois ideology into the workers' movement.

The 15th Plenum of the CPCZ Central Committee reiterated that revionism and opportunism can be compared to weeds: even if torn out of the ground, they have a tendency to reappear after a while. They exploit shortcomings, mistakes and questions which are not immediately answered; they exploit every situation where new answers involving risks are being sought. Their activity is always on the rise when class struggle on the global scale sharpens.

The most effective guarantee against the recidivism of revisionism and rightwing opportunism, regardless of where and in what form they appear, is the creative development of the Marxist-Leninist theory, its consistent application in practice, and the strengthening of the action and ideological unity of the party.

In the ideological sphere we cannot permit unprincipled attiudes, liberalism, and indifference toward the principles governing our policy. The historic experiences of our communist party and, in the first place, of the CPSU, testify to the ability of the workers' movement and its revolutionary avant guard to resist both opportunism and revisionism as well as all forms of bourgeois ideology and to develop Marxist-Leninist ideology creatively. The defeat of revisionism and bourgeois ideology in our country in the 1968-1969 period fully confirmed that the fate of socialism in a given country depends on the correct policy of the communist party, its ability to use creative and undogmatic methods in applying the teaching of Marxism-Leninism to the solution of various tasks in building a socialist society.

Even the smallest departures from the Leninist principles of criticism of revisionism and opportunism, the smallest manifestation of liberalism, can have disastrous effects on the development of a socialist society and can lead to complications, to the loss of momentum, to attempts by the bourgeoisie to slow down the march forward and to stop revolutionary development. It was no accident that the 15th Plenum of the CPCZ Central Committee emphatically reiterated that a consistent application of the Lesson from a crisis development in the party and country in the period following the 13th CPCZ Congress has great significance in the struggle for Marxist-Leninist unity of the party and in the struggle against various forms of revisionism and opportunism. The Lesson, reconfirmed at the 14th and 15th CPCZ Congresses, has been a permanent source of inspiration for our work, an example of the creative application of Marxism-Leninism in our conditions.

DEVELOPMENT, TRENDS IN PEOPLES'S NAVY OUTLINED

Stuttgart MARINE-RUNDSCHAU in German Vol 77 No 8, Aug 80 pp 475-484

[Article by Peter Joachim Lapp, East-West editorial staff, DEUTSCHLANDFUNK: "The GDR People's Navy"]

[Text] 1. The First Maritime Formations: From the Maritime Police to the Naval Forces of the National People's Army [NVA] (1950-1956)

In February 1950, at the direction of Soviet Russia, a "Maritime Police Administration"[1] was established in the GDR Ministry of the Interior; on 15 June 1950 it was elevated to "Main Administration for the Maritime Police" (HVS) by resolution of the GDR Council of Ministers.

The SED named then General Inspector of the People's Police Waldemar Verner director of this HVS.[2] The actual birthdate of the GDR Navy is 15 June 1950.

The new formation, which was designated as the Maritime Police, was first of all supposed to help secure the coast. At the time, the emphasis in this connection was on land-based sealing off of the coast/border with the help of small boats and coast guard stations. The beginning was modest:

In the early days the Maritime Police was able to use only three old hopper cars from the earlier Wehrmacht; not until summer 1951 did the government make 150 horses available in order to improve mobility in the coastal strips.[3] Later on the partially mounted Maritime Police did, of course, also obtain boats from the fleet of the old navy which the Soviets had conquered and no longer wished to use themselves. In this we are talking about patrol boats, mine-hunters and demolition boats.

With the creation of the "Garrisoned People's Police" (KVP) on 1 July 1952 a "People's Maritime Police" developed out of the Maritime Police. At the same time, the GDR also began building seaborne border security forces. The Maritime Police and the People's Maritime Police, respectively, starting in mid-1952, gave the "Maritime Border Guards: coastal patrol boats, the People's Maritime Guards then concentrated on keeping shipping lanes and the fishing regions free of mines.[4]

In addition, the People's Maritime Police had to look after "general security tasks." The People's Maritime Police and Maritime Border Guards were obliged to work together closely, both formations provided each other with mutual support, primarily in respect to "protecting the sea border."

Effective 1952, the People's Maritime Police received the first larger ships from domestic shipyards:

By 1956 the Stralsund Shipyard and the Peenewerft in Wolgast delivered a total of 12 Habicht class (I and II) minelayers and sweepers (MLR). The MLR's were strongly reminiscent of the minehunters (M 40 and M 43, respectively) of the wartime navy. Technical specifications: Habicht I class was developed in the period 1952 to 1954 and displaced 480-500 tons at 1518 knots. The type had 1 8.5-cm cannon, 4 2.5-cm antiaircraft guns, depth charge throwers and mines. The Habicht II class was built between 1954 and 1956, it displaced 650 tons at 15-17 knots and had the same armament as Habicht I.[5]

Moreover, in the first half of the 1950's the People's Maritime Police acquired about 40 demolition boats of the Schwalbe class (75 tons; Engelbrecht, Berlin-Koepenick), and about 100 "coastal patrol boats" of the Tuemmler/Delphin class and the Sperber class (50-78 tons; Engelbrecht and Peenewerft) strengthened inshore coastal protection.

The Ernst Thaelmann, a former Danish fishery protection vessel (the Hvidbjoenen) was both training and flagship of the People's Maritime Police during those years; it became part of the wartime navy during the German occupation of the Kingdom of Denmark in 1940 and served as an auxiliary ship (The Dorsch); in 1945 it finally became part of the Soviet spoils of war. The 1,050-ton ship was then given to the People's Maritime Police by the Soviets and in 1953-1954 it was rebuilt at the Neptun Shipyard in Rostock.[6] With a skeleton crew of about 40 men the "Ernst Thaelmann" was able to accommodate about 80 naval officer candidates who completed their practical training there.

Since 7 January 1952 there has been a "Naval Officer Training Facility" of the Maritime Police and People's Maritime Police, respectively, in Stralsund.[7]

In the mid-1950's the SED was in a position to draw on a nucleus of naval officers, thus permitting the establishment of regular naval forces. Except for a few former lower ranking naval officers from the wartime navy who occupied staff positions in the People's Maritime Police, these "cadres" no longer had any war experience.

2. The NVA's Naval Forces (1956-1960)

After the formation of the NVA and a Ministry for National Defense the "Administration for Naval Forces" began its work in this ministry on

1 March 1956. The squadrons, units and formations of the new naval forces of the NVA were to be established in their basic outline by 1 July. Since the People's Maritime Police had the responsibility of inshore security tasks and guaranteeing the protection of the sea border, the tasks of the NVA naval forces were expanded: Under the direction of the Baltic Red Banner fleet the GDR Navy was to become one part of the united Baltic Sea Fleet of the Warsaw Pact and receive "combat tasks" throughout the Baltic Sea.

For this reason cooperation between GDR forces and the Soviet fleet and--secondarily--the Polish navy now took on increased importance: in June 1957 the first joint tactical exercise of the three fleets took place under the command of the chief of the Baltic Red Banner Fleet; additional joint maneuvers followed.

In 1969 an officer in the People's Navy offered the following assessement of the first phase of cooperation:

"In the framework of the allied socialist fleets, in the first years of their existence the NVA's naval forces solved important tasks of securing and safeguarding which were essential for temporary support and for the development of the Baltic Red Banner Fleet naval forces in order to jointly repulse and destroy any enemy at sea. They had to be in a position to guarantee all kinds of defense in their sector and at the same time organize an adequate system for safeguarding and supplying their own and allied fleet forces. This objective was the beginning of the systematic cooperation between the allied fleets."[10]

Then the regular GDR Navy also began to practice interaction between land, air and sea forces and to test, above all else, landings via sea "under real combat conditions."[11]

In order to fulfill this clearly expanded objective, the USSR delivered to the GDR Navy ships and boats that it had manufactured.

In December 1956 the GDR naval forces received the first "superships": frigates of the Soviet Riga type.[12]

Toward the end of the 1950's the GDR Navy had 4 or 5 of these 1,200-ton escort vessels; it identified them as "coastal patrol ships" (KSS). Some of the frigates were later decommissioned because of explosions on board; in 1980 there is just one KSS left in the fleet according to data in the new edition of Weyer.[13]

In the period 1957-1958 10 new minelayers and sweepers of the Krake class were built at the Peenewerft in Wolgast to replace the MLR's of the Habicht class. Technical data: 650 tons, 18 knots, 1 8.5-cm, 10 2.5-cm antiaircraft guns, depth charge launchers, mines. Four of these MLR's of the Krake class stayed in the fleet until the mid-1970's.[14]

In October-November 1957 the GDR Navy took possession of several high-speed torpedo boats of the Soviet P 4 and P 6 types (50-75 tons, 2 TR [torpedo tubes]).[15]

On 1 January 1957 Vice Admiral Waldemar Verner became chief of the naval forces; he replaced Rear Admiral F. Scheffler who had held this post since March 1956. W. Verner already was chief of the Maritime Police and the People's Maritime Police, respectively.

On 1 August 1959 the SED transferred command of the GDR naval forces to Rear Admiral Wilhelm Ehm, a position which he has held to this day, interrupted only by a training tour in the USSR.[16]

At the beginning of the 1960's the coastal patrol ships and the high-speed torpedo boats comprised the "nucleus of the combat forces" of the GDR naval forces. Without submarines and naval pilots the GDR naval might have remained nothing but a coastal approaches navy with limited tasks.

3. The People's Navy in the 1960's

On 19 October 1960 the "GDR National Defense Council" (Walter Ulbricht, chairman), decided to give the name "People's Navy" to the GDR naval forces. The GDR Navy has had this new name since 3 November 1960. At the same time, it was resolved in the future to give ships and boats in the People's Navy (VM) proper names "which correspond to the revolutionary traditions of the German workers movement and socialist reconstruction work in the GDR."[17] The VM also received a new official flag with this resolution.

Following the sealing off measures in Berlin on 13 August 1961 the VM was also given "full responsibility" for the direct protection of the GDR's sea border. Up to that time the Maritime Border Guard and the coastal Border Brigade of the Border Guards had been responsible for that. Then the GDR minister for national defense put the coastal Border Brigade under the command of the head of the VM, effective 1 November 1961.[18]

This Border Brigade has the following tasks according to its commander's statements:

"The coastal Border Brigade must, according to conditions of the seasons and the tourist traffic, which is becoming increasingly greater every year.... guarantee flawless safeguarding of the sea border. The members of the coastal Border Brigade are responsible for securing the GDR sea border, including consistent use of firearms against the enemies of our state."[19]

"Enemies of the state" are, in the first place, those who violate the border, those GDR citizens who turn their backs on the republic.

At the end of 1962 the VM started training crews on "high-speed rocket boats" of the Soviet Osa type.

In 1964 the fleet received the first units of this then very modern type.

Also in 1962 the VM established its first landing units: The Peenewerft in Wolgast, starting in summer 1962, delivered "medium landing ships" of the Robbe type (600 tons, 12 knots, 2 4.5-cm, 4 2.5-cm guns). The same shipyard had also been building "small landing ships" of the Labo type (200 tons, 10 knots, 4 2.5-cm guns) since 1961. In the course of the 1960's the VM received 6 Robbe and 12 Labo type vessels which were kept in service until the end of the 1970's.

In the period 1962-1963 the Pennewerft delivered the first submarine chasers to the VM: the GDR model of the Hai type replaced older Soviet boats of the SO 1 type.

The VM's new submarine chasers (300 tons, 25 knots, 4 3-cm guns, 4 anti-submarine rocket launchers)--a total of 25 were delivered--are still the backbone of the submarine defense forces.[20]

The rapid buildup of the fleet, the acquisition of a high-speed rocket boat flotilla, the establishment of submarine chaser and landing units placed high demands on the command of the VM. In the first few years there were substantial deficiencies in training; the fleet chief often vigorously criticized "insufficient results" in combat training and in political education. Chiefly in the first half of the 1960's there were numerous accidents in the fleet itself.

The chief of the VM said at the beginning of 1964:

"The tendencies, which have not yet been totally overcome in some comrades, toward embellishment, presumption and subjective interpretation of commands by superiors and of resolutions by the party leadership hinder us in our work."[21]

And 2 years later Wilhelm Ehm said:

"The requirement to make military order and discipline and the observence of service regulations in daily work was not fully realized in the period 1964-1965. ...After all, in various units there was still a lack of tight organization in daily service. ...The training of our young officers also requires...overcoming a number of deficiencies and weaknesses in the process of academic work."[22]

Toward the end of the 1960's, however, the greatest training deficiencies in the VM appear to have been remedied, the command of the VM tackled more vigorously than before the task of gearing the level of the GDR Navy to its Soviet ally. At the same time the political education of the members of the VM was again speeded up. Wilhelm Ehm, who meanwhile had become vice admiral, wanted to be assured that, among other things, the following beliefs were solidly established:

"Educating the members of the VM to have unbridled hate toward the imperialist class enemy and its helpers. ...Only in the unity of boundless devotion in respect to the party, solidarity vis-a-vis comrades in arms and deep hate toward the class enemy are our comrades capable of fulfilling ...their class mandate decisively and under all conditions."[23]

At the end of the decade the VM had about 19,000 men, approximately 300 ships and boats, a helicopter squadron and 2 coastal rocket detachments.

The make up of the fleet (without auxiliary ships) was as follows in 1969:[24]

Table 1: VM Fleet in 1969

4 frigates/coastal patrol ships, USSR Riga type, 1,200 tons, 28 knots, 3 10-cm, 4 3.7-cm guns. 2 TR's, 4 antisubmarine rocket launchers, 50 mines

10 mine hunters/minelayers and sweepers (MLR's), Krake class, 650 tons, 18 knots, 1 8.5-cm, 10 2.5-cm guns, 4 depth charge throwers, 30 mines

25 submarine chasers, Hai class, 300 tons, 25 knots, 4 2.5-cm guns, 4 antisubmarine rocket launchers

6 mine hunters/minelayers and sweepers (MLR's), Habicht (I) class, 500 tons, 17 knots, 1 8.5-cm, 8 2.5-cm guns, 4 depth charge throwers, 18 mines

6 mine hunters/mine layers and sweepers (MLR's), Habicht (II) class, 550 tons, 17 knots, 2 5.7-cm, 8 2.5-cm guns, 4 depth charge throwers, 20 mines

6 medium landing ships, Robbe class, 600 tons, 12 knots, 2 4.5-cm, 4 2.5-cm guns

12 small landing ships, Labo class, 200 tons, 10 knots, 4 2.5-cm guns

35 high-speed torpedo boats, USSR P4/P6 type, 50/75 tons, 42/45 knots, 2 TR's, 4 2.5-cm guns

12 high-speed rocket boats, USSR Osa type, 200 tons, 35 knots, 4 launchers for short-range rockets ("Styx"/SS-N-2), 4 2.5-cm guns

12 light high-speed torpedo boats, Iltis class, 20 tons, 30 knots, 2 stern TR's

16 submarine chasers, USSR type SO 1, 215 tons, 28 knots, 4 2.5-cm guns, 4 antisubmarine rocket launchers, mines

50 demolition boats, Schwalbe class, 50 tons

48 patrol boats, Sperber class, 56 tons

45 patrol boats, Tuemmler/Delphin class, 50 tons

4. The VM from 1970 to the Present

a) Part of the United Baltic Sea Fleets of the Warsaw Pact

Since their existence, the GDR naval forces have been part of the united Baltic Sea Fleets of the Warsaw Pact, they are under the supreme command of the Baltic Sea fleets in Leningrad. In this connection, there is the following statement in a standard work on GDR national defense:

"The VM fulfills its mandate in solid brotherhood of arms with the Soviet Baltic Red Banner Fleet.... The common interest in maritime protection of the socialist Baltic Sea states determines the position of the VM in this fleet alliance, both in respect to uniform armament and equipment, organization and structure, deployment, training and education, and to political and military leadership."[25]

The Soviets' Baltic Red Banner Fleet functions officially as the great mentor for the VM within this alliance. Interaction between the united Baltic Sea fleets is constantly practiced; the intensity of maritime common concerns is often praised.

Rear Admiral Guenter Kutzschebauch, deputy of the head of the VM and director of the Political Administration in the GDR naval forces, said in 1975:

"In the past 20 years such a deep friendship has developed between the three Baltic Sea fleets that today it is considered perfectly normal to carry out combat and operative-tactical training on the basis of uniform documents. It has also become a matter of fact that in the course of exercises and maneuvers, depending on the situation and task, the participating forces function in mixed groupings and are led by the chiefs of staff of either the BRF (Baltic Red Banner Fleet, editor), the PSKF (Polish Navy, or the VM."[26]

Generally, Soviet maritime interests, Soviet naval strategy and tactics and the level of Soviet naval arms define the objective, the field of action and service in the Baltic Sea fleets.

The VM even adopts the most important regulations of the Soviet fleet; all technical standards, the basic teaching materials and fundamental documents of all kinds from the Soviet navy are adopted by the VM or used as a basis for its own documents. Even the staff service regulation of the Soviet fleet is, as it says, "used" in the VM.[27]

b) Organization of the VM

The chief of the VM is Wilhelm Ehm, who--with the rank of admiral--is simultaneously deputy GDR defense minister. He is in charge of the "VM

6. 1st Flotilla (Peenumuende)
7. 2nd Flotilla (Sassnitz)
8. 4th Flotilla (Warnemuende)
9. 6th Flotilla (Bug)
10. Independent units: coastal Border Brigade
11. Independent departments
12. Brigades
13. including high-speed rocket boat/high-speed torpedo boat brigades
14. VM rearguard service
15. Detachments
16. including--minelaying and sweeping detachment (1st Flotilla/4th Flotilla)
17. Landing ship detachment (1st Flotilla)
18. Submarine chaser detachment (1st Flotilla/4th Flotilla)
19. Coastal patrol ship detachment (4th Flotilla)

c) Structure of the VM

At present the VM has 181 fighting units (ships and boats) and 32 training and auxiliary ships (excluding the vessels of the GST and the Maritime Hydrographic Service/SHD of the GDR).[29]

Frigates/Coastal Patrol Ships (KSS)

The fleet has two frigates (KSS) of the Soviet Koni type, the KSS Rostock and the KSS Berlin (put into service in July 1978 and May 1979, respectively) These ships displace 1,800 tons (standard) and have missile armament (2 SA-N-4), 4 7.6-cm, 4 3-cm guns, 2 antisubmarine rocket launchers and mines.[30]

The VM designates the KSS's as "multipurpose fighting ships" whose primary tasks consist in repulsing attacks by high-speed boats and air attacks and in combating submarines.[31]

The acquisition of at least one additional unit of the Koni class from the USSR is expected.

Data in the 1979-1981 edition of Weyer indicate that the fleet also still has one frigate of the Riga type.[32]

High-Speed Rocket Boats

Since 1964 the VM has had in its fleet high-speed missile and rocket boats of the Soviet Osa type. Today there are supposed to be a total of 15 high-speed rocket boats (12 of the Osa I type, 3 of the Osa II type). The units have four launchers for floating target short-range rockets (SS-N-2a) and 4 3-cm antiaircraft guns. Officers of the VM termed the high-speed rocket boats the "cost combat-effective" boats that they have. Tasks: To fight and destroy with "concentrated blows" the enemy's surface vessels, escorts and landing detachments."[33]

Command" in Rostock. Within the VM a "Political Administration" takes care of implementing the influence of the SED. The organization of the VM is given in Chart 1.

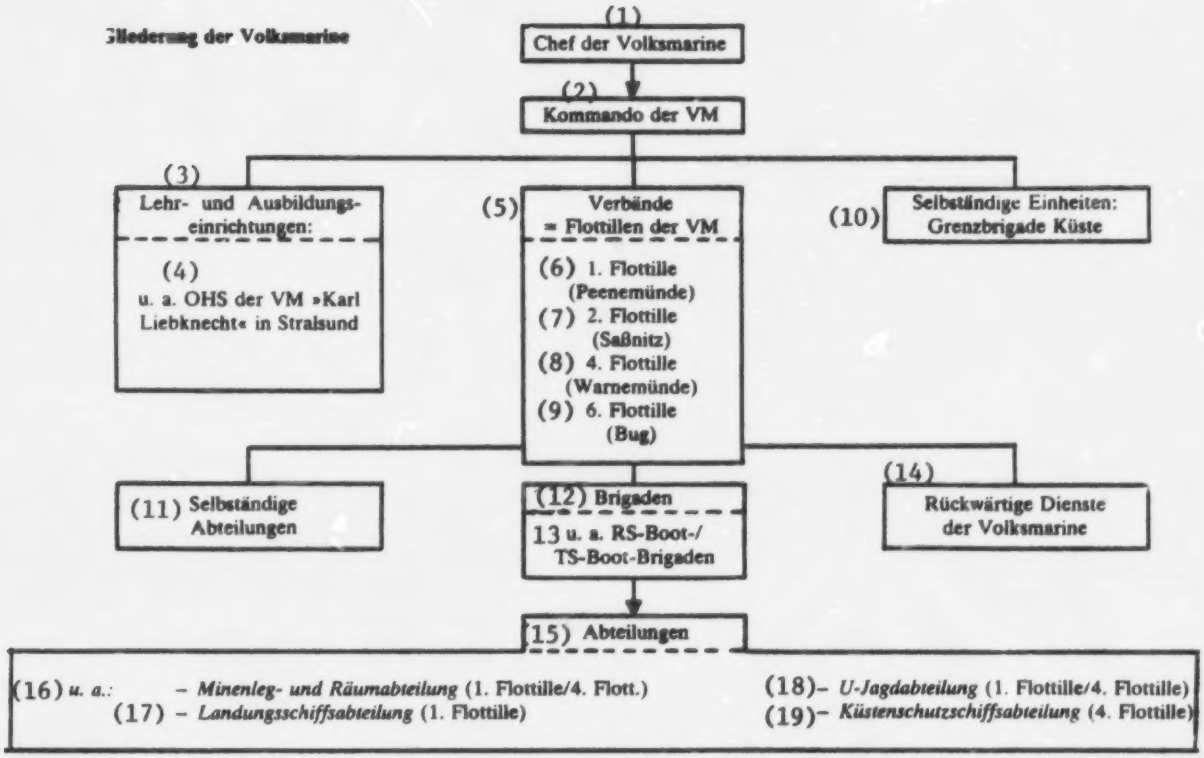

Chart 1. Organization of the VM

Key:

1. Chief of the VM
2. VM Command
3. Instruction and training facilities:
4. including, the Karl Liebknecht Advanced School for Officers in Stralsund
5. Squadrons = VM flotillas

The high-speed rocket boats are now out of date, but there are reports indicating that the electronic equipment (fire-direction equipment for rockets) is to be modernized in 1980.[34]

High-Speed Torpedo Boats/Light High-Speed Torpedo Boats

At the end of the 1960's and the beginning of the 1970's the VM introduced high-speed torpedo boats of the Soviet Zherzhen type. At present, 18 vessels of this class seem to be in service in the fleet. The high-speed torpedo boats displace 145 tons and carry 4 53.3-cm TR's and 4 3-cm guns. They, too, are obviously going to be modernized this year.

The VM's high-speed torpedo boats are charged with attacking enemy surface vessels and with operating individually or even in groups in the process.[35]

In addition to the high-speed torpedo boats the VM has "light high-speed torpedo boats" (LTS) which are domestically produced.

In 1962 the Iltis type (30 tons, 2 TA 53.3 h, 45 knots, was introduced, with approximately 10 of them still in service today.

Since 1973 the GDR has been building a new type of LST: the Libelle class which is also 30 tons. Armament: 2 53.3-cm TR's and 2 2.3-cm antiaircraft guns, 40 knots.[36] There are now about 30 LTS's of this type in the fleet.

Mine Hunters

Since 1967-1968 the Peenewerft in Wolgast has been guilding so-called "mine hunters and demolition ships" (MSR) to replace the MLR's of the Krake class. These MSR's, which have been identified as being in the Kondor class, have been joining the fleet since 1969.

Since then, the VM has received about 50 of this type which can be divided into two subclasses: the VM distinguishes between the coastal MSR (Kondor I) and an oceangoing MSR (Kondor II). The coastal MSR (20 units) are primarily used in outpost service in the coastal Border Brigade and have less armament than the oceangoing type; furthermore they are 2 meters shorter. The oceangoing MSR's (Kondor II) displace 245 tons and have 6 2.5-cm antiaircraft guns (water displacement varies only slightly in the coastal type), these MSR's have the primary job of hunting enemy mines and destroying them.[37]

The Kondor class MSR's are more or less the VM's standard type; it appears that they will continue to be built. The 1979-1981 edition of Weyer records 52 units.[38]

Submarine Chasers

Today the fleet still has only submarine chasers of the Hai class (produced in the GDR since 1962-1963). The smaller Soviet submarine chasers of the SO 1 type have been decommissioned in the meantime.

The Hai class displaces 300 tons and carries 4 antisubmarine rocket launchers and 4 3-cm antiaircraft guns. Some 14 submarine chasers are said to be still in service.[39] With appropriate rebuilding these submarine chasers can also take on mines.[40]

There are first reports of the new construction of a larger submarine chaser in the GDR.[41]

Landing Ships

The VM has approximately 12 landing ships of the Frosch class in service today; they were built at the Pennewerft between 1975 and 1979. This larger landing ship type displaces 1,950 tons, or 4,000 tons loaded, has 4 5.7-cm and 4 3-cm antiaircraft guns (more recently antisubmarine rocket launchers are said to have been installed) and can take 12 tanks on board.

Some 10 additional vessels of a new landing ship designated as the Eidechse class are under construction at the same shipyard.[42] The medium-size and small landing ships of the Robbe and Labo classes are no longer in service.

Other Ships

Since 1976 the VM has owned a rather large training ship, the Wilhelm Pieck, built in Poland (Wodnik type) with a displacement of 1,800 tons and armament of 2 3-cm and 4 2.5-cm antiaircraft guns. The ship goes on foreign cruises with VM officer candidates on board; in summer 1979 the Wilhelm Pieck, together with a salvage and rescue ship, appeared for the first time in warm waters (Mediterranean/Black Sea).

In addition, the fleet still has the salvage and rescue ship Otto von Guericke, 5 tenders and repair ships, 3 tankers, 2 net layers, 3 salvage tugs, 2 icebreakers, 3 training ships (former MLR's) and 6 training boats, 2 torpedo recovery boats and 3 "measuring ships."[43]

Independent Formations of the VM

The coastal Border Brigade numbers about 3,000 men who secure the GDR's sea border in 8 boat groups and in the border coastal service in 12 batallions on land (including training units).[45]

In addition, the VM has "aerial forces." Currently there is a helicopter squadron for antisubmarine defense, coastal observation and sea reconnaissance; it is equipped with helicopters of the Soviet Mi-8 type. The pilots are naval officers.[46]

Furthermore, there is a "coastal artillery" with two coastal rocket detachments.

A "naval infantry" is apparently being developed. The Ernst Mortiz Arndt motorized rifle regiment 29 in Prora on Ruegen, which for a long time

has been in the process of being trained for landing operations,[47] could be elevated to this.

d) VM Training and Personnel

The highest internal training facility of the VM is the Karl Liebknecht Advanced School for Officers in Stralsund. Young men are trained here in a 4-year course of study to become VM officers. Divided into two sections for budding naval officers and for future officers in the engineering service, the officer candidates undergo in 4 "years of instruction," interrupted only by practical training on board, qualitatively excellent training which concludes with promotion to lieutenant and the awarding of the (civilian) professional designation of "advanced school engineer."[48]

Following the completion of their training, the young lieutenants of the VM may consider themselves as part of the naval officer corps which comprises about 1,800 men; this corps considers itself to be the elite of the VM and also of the NVA.

Additional studies either at the Friedrich Engels Military Academy in Dresden and/or at Soviet naval academies prepare them for use as staff and flag officers, respectively.

Training centers for "sailor specialists" and noncommissioned officers in the VM are the two fleet schools in Parow (near Stralsund) and in Kuehlungsborn.

Training to be a career officer in the VM involves two stages: First, completing a 5- or 10-month long course of study, respectively, at the fleet school, followed by promotion to Petty Officer 3rd Class. Then, at the earliest, after 2 to 3 years of service as a noncommissioned officer a career officer's course of study of 3 to 6 months can be taken which ends with promotion to Petty Officer 1st Class (corresponds to boatswain/sargeant).[49]

The VM has six service careers. These are the nautical, technical, coastal service, administrative, medical and legal (military judicial service) careers.[50]

The personnel of the VM numbers about 17,000 men, including 1,800 officers.[51]

Outlook for the 1980's

The addition of extremely modern frigates of Soviet manufacture, the expansion of the landing fleet and the broadened tasks of the naval helicopter forces have undoubtedly increased the capabilities for using the VM. In the event of a conflict the VM, together with the Soviet fleet, is in a position to carry out landings and undertake offensive actions on foreign coasts.

In addition, strongly intensified training of the VM is to be noted. In connection with this the VM command still displays verbal aggressiveness which, given the mood of detente in Europe, has to be a source of amazement. At the end of 1979 Admiral Wilehlm Ehm said:

"...the introduction of new weapons and technology also (requires) new tactical methods of use..., which...can only be... tested in practice at sea. ...Intensive combat training at sea is hard training that is thoroughly prepared, designed to be combatlike, is rigidly controlled, with the use of opportunities for developing skills and capabilities and with exhaustive use of all educational potential. ...Combat training at sea must...to the highest possible degree reflect the harshness, complicated nature and the dynamics of combat actions to be anticipated at sea, it must make it possible for all participants to experience them, and it must thus promote combat-oriented thought and behavior." [53]

In the 1980's, too, however, the most important task of the VM remains securing the GDR's own sea border which is about 360 km long (surveillance of the air and sea space) and hindering the "flight from the republic" on the part of GDR citizens via the sea.

The GDR VM might thus remain a pure "coastal outpost navy" which can move only in the wake of the Soviet fleet.

The VM fleet had the following composition in 1979:

Table 2: VM Fleet in 1979[52]

2 frigates/KSS, USSR Koni type, 1,800 tons, 32 knots, 4 7.6-cm, 4 32-cm guns, 2 SA-N-4 antiaircraft rockets, 2 antisubmarine rocket launchers, mines

1 frigate/KSS, USSR Riga type, 1,200 tons, 28 knots, 3 10-cm, 4 3.7-cm guns 2 TR's 53.3, 4 antisubmarine rocket launchers, mines

52 mine hunters/min-hunting and demolition ships (MSR), 245 tons, 21 knots 2 to 5 2.5-cm guns (Kondor class I/II)

15 high-speed rocket boats, USSR Osa type, 200 tons, 36 knots 4 SS-N-2a short-range floating target rockets, 4 3-cm guns

14 submarine chasers, Hai class, 300 tons, 25 knots (?), 4 3-cm guns, 4 antisubmarine rocket launchers

18 high-speed torpedo boats, USSR Zherzhen type, 145 tons, 40 knots, 4 3-cm guns, 4 TR's 53.3

30 light high-speed torpedo boats, Libelle class, 30 tons, 40 knots, 2 2.3-cm guns, 2 TR's 53.3

10 light high-speed torpedo boats, Iltis class, 25 tons, 45 knots, 2 TA 53.3 h

18 patrol boats, KB 123 class, 25 tons, 2 machine guns (14 knots)

2 landing ships, Frosch class, 1,950 tons, 4 5.7-cm, 4 3-cm guns, 12 tanks, 800 tons load (18 knots).

RED CROSS COMMISSIONS EXAMINE HEALTH SITUATION IN MINES

Prevention of Pneumoconioses

Bucharest SANATATEA in Romanian Jul 80 p 6

[Article by Prof Dr Docent Petre Manu, head of the Department of Labor Medicine and the Bucharest Occupational Disease Clinic]

/Text/ The presence of dust containing a high percentage of silicon dioxide in the atmosphere of work places is the risk factor in the incidence of pneumoconioses. In such cases the pneumoconiosis that occurs is silicosis, an acute form of pneumoconiosis. As a rule pneumoconiosis sets in after an exposure of 3-5 years, depending on the concentration of the dust and a number of individual factors like previous pulmonary diseases, chronic bronchites and the smoking habit. Smoking is an aggravating factor for the incidence of silicosis and of pneumoconioses in general because cigarette smoke has a paralyzing effect upon the cilia in the respiratory tracts. These cilia are the ones that are topped with a fine mucous film that catches the solid particles entering the respiratory tracts and expels them from the lungs. When the conveyor belt of mucous is stopped because the cilia are no longer in motion, all the dust that enters the lungs is deposited in the respiratory alveoli and bronchiole. Cigarette smoke temporarily arrests the mechanism for purifying the lung, called the mucociliar escalator, although these mechanisms are highly effective. It has been calculated that over a period of 30 years a miner inhales about 6 kg of dust, 98-99 percent of which is eliminated by the purifying mechanisms and about 1-2 percent remains in the lungs, causing pneumoconiosis. It is clear that any disturbance of the purifying mechanism facilitates the faster development of pneumoconioses, including the effect of cigarette smoke.

Therapy has made progress now and the results are satisfactory, to the extent that man's life has been prolonged far beyond what it was 20 years ago in the acute forms of silicosis. The treatment of superaerial infections (acute and chronic bronchitis) is particularly important. Bronchial diseases in a pneumoconiotic very severely aggravate the evolution of silicosis because the self-purifying mechanisms are handicapped and the inflammatory process affects the evolution of pulmonary fibrosis in pneumoconioses. Preventive and curative antibiotic treatment is also promising, showing very good results in

improvement of the clinical condition. In the case of a silicotic a bacillary superinfection causes a rapid evolution of the disease. Therefore prevention of the superinfection is a useful therapy in stopping the evolution of the disease. Moreover a declared and promptly treated silicotuberculosis is now a modern therapeutic means of improving the patient's health and prolonging his life.

Coal pneumoconioses are among the preventable occupational lung diseases, and consequently the complications (which are factors aggravating evolution) can be avoided. The preventive measures that have been taken have greatly reduced them in Romania. The first measure is to reduce the concentration of dust to the maximum tolerable levels at work places, by such technical measures as infusion of water into the coal blocks through the drill holes under a pressure of 2-4 atmospheres. The water soaks the coal and greatly reduces the amount of dust produced in the explosion. Other technical measures that can be taken are precipitation of the dust by spraying water into the air of the stope chambers, etc. The second measure is regulated control of the concentration of dust at work places by keeping it as close as possible to the maximum tolerable levels.

Good results are also obtained by medical supervision of the work places and miners in order to detect pneumoconiosis in an incipient stage. We now have medical methods of precise investigation that can detect the disease at its onset. In such cases it is recommended to transfer the respective worker temporarily to work places with less exposure to dust, so that his lungs can eliminate the accumulated coal dust.

Other medical measures consist of treatment of the complications, of chronic bronchitis and tuberculosis. But in general the longevity of coal miners is unaffected if there is a well-organized medical and labor medicine service and if the measures are taken to reduce the concentration of dust at work places. Today any miner working in a mine can work and live just like any other man who is not exposed to dust. It is clear that maintenance of health is not the sole responsibility of the physician and the administrators but also that of the miner himself. Every miner must realize that smoking is an aggravating factor and that a heavy consumption of alcohol also interferes with the function of purifying the lungs.

As we know alcohol is to a great extent eliminated by respiration. The presence of alcohol in the lungs affects the self-purification mechanisms, which cease their activity so that they can no longer cleanse the lungs of the dust that has entered them. What is more, heavy drinking lowers the resistance of the organism in general and the individual falls ill more often.

Consequently the miner's health also depends upon how he takes care of it.

Prevention of Rheumatic Diseases

Bucharest SANATATEA in Romanian Jul 80 p 6

/Article by Prof Dr Remus Nestor, head of the Rheumatology Clinic at the Methodological Center for Rheumatology/

[Text] Pursuant to the studies made by WHO determining the main peaks of the incidence of disease in the mining environment, the Ministry of Health, the

Ministry of Labor and the General Union of Romanian Trade Unions have started a joint campaign for prevention and treatment of the main diseases including those of the locomotor system.

What is the rheumatologists' role in this effort? Primarily to help in detecting rheumatic diseases as early as possible, an objective that is vital in the case of these diseases, the causes of which are considered to be a possible genetic predisposition or the presence of a virus or an immunological imbalance. Since the rheumatic diseases involve many factors and require consideration of a wide range of risk factors in their prevention, they call for a combined and lengthy effort. For example, it took a long time to determine that treatment with drugs can prevent inflammation of the joint in gout but not the disease itself or the evident metabolic disturbance, and that on the other hand acute articular rheumatism can be prevented by correct treatment of the streptococcal attack at the onset.

The studies made at the Methodological Center for Rheumatology did not confirm any greater incidence of spondyloses, arthroses, vertebral sciatica, chronic lumbago, secondary tendinites, bursites and arthrites, or focal infections in the case of miners than in the rest of the population, to mention only a few of the rheumatic diseases with high death rates but which can be prevented. Paradoxically, other types of rheumatic diseases were also found among miners that are sometimes caused by the modernization process, which tends to limit their physical exertion and their involvement in greater intermittent efforts. This also includes the development of the humidification process.

These are only a few examples demonstrating the need of preventive measures. Noteworthy among them is the part played by transmission of the mining profession from father to son, involving a direct apprenticeship. But it does not follow that miners' sons will not be strictly selected according to the hiring standards in force, since there are a number of ailments of the locomotor system that are incompatible with the mining trade.

Prevention of rheumatic diseases begins with hiring and is continued by periodic check-ups every 6 months, according to parameters in which the rheumatologist's responsibility will have the necessary weight.

The proposed offer of a free meal before going on a shift should be considered very valuable for its preventive effect. But it does not bestow the right to an abundant meal at home, rich in fats and "washed down" with alcoholic beverages, after leaving a shift. These excesses can increase the body weight (and alcohol is fattening!) and consequently favor the development of two risk factors for chronic degenerative rheumatism, namely overweight and atheromatous deposits.

The proposal to assign seaside hotels to miners for treatment at all seasons is also welcome. In addition, every miner must keep up the effort to strengthen the organism by exercises, roadwork, outdoor living, and use of places of recreation.

Kinesitherapy is an excellent method, provided it is adjusted to and alternated with rest. Postural hygiene and physical treatments are unquestionably effective, and they can now be performed at the physiotherapy stations upon departure from work. But all these therapeutic methods require perseverance on

the part of the miners, and observance of the physician's directions in order to improve health or recover working capacity.

Red Cross Commissions

Bucharest SANATATEA in Romanian Jul 80 pp 6-7

/Interviews with Dr Nicolae Aldica, vice chairman of the Lupeni Municipal Red Cross Committee, Nurse Elena Cernea, Petrosani Municipal Hospital, and Ion Mischie, chairman of the Petrosani Municipal Red Cross Committee, by Nicolae Turturescu/

/Text/ All health personnel working in Romania's coal regions and all members of the Red Cross committees and commissions are concerned with the far-reaching problems of protecting miners' health. The dialogue with the volunteer activists and health personnel gave us the opportunity to record some interesting opinions on the role of health education in maintaining health in underground working conditions and to determine the scope of the Red Cross organizations' efforts.

The Physician as Health Counselor and the Red Cross as Educator

DR NICOLAE ALDICA: Many years ago reporting for periodic check-ups was a problem in Valea Jiului. The figures show how serious this problem was: Only about 30 percent of those working in the Barbateni Mine and only 45-60 percent of those working underground at the Lupeni IM /Mining Enterprise/ were responding to the invitation to have these check-ups. Nor was the attendance any better at the MRF /expansion unknown/ mobile units or the Petrosani Pneumoconioses Laboratory. Why? Because the absentees had their arguments: "My father was a miner too and he didn't have so many check-ups," or "I will report to a doctor when I get sick."

Sustained efforts of health personnel and activists of the Red Cross, trade union and youth organizations were needed to combat this attitude, as well as the help of the enterprise party organizations and managements. Thanks to an extensive, diversified and persevering health propaganda effort, today over 95 percent of the miners are reporting for the periodic check-ups at the enterprise medical dispensaries, over 97 percent are reporting to the MRF mobile units and over 80 percent are reporting to the Petrosani Hospital for standard X-rays.

We could be satisfied with the results and it could be concluded that the problem has been solved. But having induced the miners to respond to the periodic invitation to check their health, we must accustom them to visiting the consulting rooms not only for the periodic medical check-up or to get the "disease sheet," as they call the medical certificate, but whenever they note a change in their state of health or do not feel well. Today the miner should regard the physician as his adviser on health matters.

In order to improve the effort to prevent diseases in miners, in the second half year all miners working underground at working faces in Valea Jiului will be given a general medical examination. But more detailed information as to the state of each miner's health is required to enhance the quality and completeness of the periodic check-up. On this occasion it is advisable to indicate the possible treatment as well as the living and dietary regime and to provide a health-education booklet on the same subject. This would result in a "pointed" health education with good results, in the sense that the informed patient would take an active part in his recovery. I think this should now be the objective of the health-education work and the health propaganda conducted with the aid of the Red Cross commissions.

I also think it necessary to supplement the list of medical examinations for hiring and the periodic check-up with an orthopedic examination accompanied by X-rays of the vertebral column to detect possible malformations or diseases in incipient stages (spondyloses, discopathies) that can be aggravated by stresses in the course of the production process.

Since the mining profession is often transmitted from father to son, opinion in favor of the need of periodic check-ups and self-supervision of the state of health must be formed in families and supplemented in schools. Automation, mechanization and further improvement of the underground microclimate (important factors for prevention of diseases) must be supplemented by increasingly active participation in protection of the miner's own health.

Abuse of Alcohol Can Be Checked by Means of Health Education

NURSE ELENA CERNEA: The Health Education Laboratory of the Hunedoara County Health Directorate made two surveys to determine the motivating factors in some miners' excessive consumption of alcohol. The first one, in 1968, indicated that 31.9 percent of a sampling of 650 miners drank alcoholic beverages daily and 68.1 percent did so occasionally. Of these, 62 percent preferred distilled beverages and 38 percent preferred fermented ones. The second survey, in 1977, based on a sampling of 320 miners, showed an increased preference for the fermented beverages (especially beer) on the part of 57 percent of those tested, as well as the fact that 11 percent of those questioned did not drink any alcoholic beverage.

In the second survey, 56 percent knew the harmful effects of alcohol upon health but explained their consumption variously, revealing the fact that they gave in to inherited "pinciples": "Alcohol drunk after work combats fatigue," "Alcoholic beverages are indicated in the treatment of colds and viroses," and "Consumption of alcoholic beverages passes time."

The decreased percentage of consumers of distilled beverages between the two surveys (from 62 percent in 1968 to 32 percent in 1977), the increased percentage of those wo drink beverages with a low alcohol content (from 38 to 57 percent), and the existence of those who do not drink alcoholic beverages as well as the knowledge on the part of the majority of those questioned in 1977 of the bad effects of alcohol consumption upon health bear witness to the effectiveness of the propaganda and health education work done by health personnel in

collaboration with the mass and public organizations and especially with the Red Cross, as well as the fact that abuse of alcohol can be combatted by health education.

Accordingly the County Health Directorate has made an intensive effort of propaganda and education on this subject through its health education laboratory and in collaboration with the Red Cross committees and commissions. A wide audience was attracted by the symposiums on "The Miner's Living and Dietary Regime" organized by the National Council of the Red Cross Society, the health-education films on this subject followed by discussions, the dialogues between physicians and miners entitled "A Tonic with a Reverse Effect" and "What We Should Know About Alcoholic Beverages," the pamphlet "The Truth About Alcohol" put out by the Red Cross, the folder "Abuse of Alcohol and Its Consequences" published by the Bucharest Institute of Hygiene and Public Health, and the flyer published by the Hunedoara County Health Directorate.

The first results of this overall health-education effort are encouraging. The percentage of consumers of distilled drinks is declining and the demand for cooling beverages (Pepsi-Cola, Bem-Bem, Sambucovit) is growing. The miners have taken a greater interest in the health-education programs on this subject that have been organized at work places, clubs and cultural homes. Of course neither we nor the Red Cross Municipal Committee are going to stop there.

Further improvement of health-education work, adoption of new ways and means, enlistment of various specialists (physicians, psychologists, sociologists, ergonomists and jurists), and collaboration with all mass and public organizations and with all educational elements will help to foster responsible behavior toward health and to strengthen the miners' health and working capacity.

Declining Death Rate as the Preliminary Criterion of Health Education

ION MISCHIE: The Petrosani Municipal Red Cross Committee's effort toward organization of Red Cross activities and health-hygiene education in the mining units in Valea Jiului was analyzed a few weeks ago at the bureau meeting of the County Red Cross Committee.* This enabled us to analyze in depth the fulfillment of our tasks under the Plan of Measures prepared by the National Council of the Red Cross Society in collaboration with the elements responsible for the protection and promotion of the miners' health. On this occasion we reported a number of measures that proved useful to members of our organization. We also stated that the analysis of activities since the start of the year determined us to introduce the decline in the death rate as the preliminary criterion of effectiveness in evaluating the organized actions. To this end we set as the objectives of all activities we shall conduct in the next period prevention and control of occupational diseases, reduction of the number of labor accidents through purposeful use of protective clothing and labor safety measures, and pleas for application of the general measures to strengthen the organism and heighten its resistance by rational use of the natural factors and a diet suited to the effort exerted. We also considered a better dissemination of the educational material we have available, namely the pamphlets "First Aid Underground," published by the Research Center for Mining Safety, "The Truth

*In Deva.

About Alcohol," published by the National Red Cross Society, and "One Can Live Without a Cigarette," published by the County Health Directorate, as well as the flyer "Miners, Check Your Health," published by the County Red Cross Committee jointly with the County Health Directorate. We shall also consider periodic discussion of the main indicators of health for purposes of precise guidance of the health-education programs in each mining enterprise according to the preventive needs.

BRIEFS

SPECULATION IN GOLD--Some time ago we wrote about the discovery by the militia organs of a case of crass eluding of the law, by Paun Chirita of No 9 Strada Ocolului, the "Man with Two Faces." To those uninitiated in the secrets of "gang trade" he seemed to be a peaceful retiree; to "specialists" in shops dealing in brooches, trimpets and other plastic "ornaments," he was a real shark. He accumulated more than 2 million lei and almost 1,800 kg of gold by committing a long string of infractions (the illegal exercise of a profession, speculation, prohibited dealings with precious metals). Recently, the speculator was sentenced to 1 year and 7 months in prison for his penal acts and the court ordered the confiscation of the jewelry in the possession of the accused and the confiscation of a large sum of money resulting from the infractions. Also, an investigation was initiated to discover the sources of his other assets. Society firmly protects its ethical principles, attacking, unmercifully, trafficking, greed and abuses. [Text] [Bucharest INFORMATIA BUCURESTIULUI in Romanian 25 Sep 80 p 3]

MACEDONIAN SUITOR UNACCEPTABLE--In the "Person to Person" column, written by Ion Baiesu, which appeared in the 16 August 1980 issue of the Bucharest daily SCINTEIA TINERETULUI, the central organ of the Union of Communist Youth, page 5, a letter from "Anda" of Medgidia tells about her friendship with and subsequent marriage to a young man of Macedonian nationality. In her words: "We were walking in front of the house and my mother saw us. She asked who he was and I said that he was a friend. She told me to break up with him because he was not for me since he was a Macedonian and I am a Romanian and that I should not waste time on a boy of my own age." However, "Anda" and the boy were married secretly. She and her husband lived with friends until he was taken into the army. Her parents came to take her home and said they forgave her for what she had done but they still insisted that she break up with her husband and marry a Romanian. Ion Baiesu's advice is: "Wait for your husband, with faith and confidence, and continue your marriage." [Editorial Report]

DEFENSE SCENARIO AGAINST AGGRESSOR SKETCHED

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1544, 3 Aug 80 pp 8-10

[Article by Stevan Korda]

[Text] The YPA [Yugoslav People's Army] assumes responsibility for stopping or at least slowing down the advance of a possible aggressor's main forces in the initial period of war and for shattering those forces together with territorial defense units by quickly launching a counteroffensive and for expelling them from Yugoslav soil.

Put most briefly, then, the task of our armed forces can be defined in those terms. Of course, this is neither simple nor easy. A possible aggressor, after all, by the very fact that he has dared to attack us at all, will be moving with considerably stronger forces than our own. With smaller forces he would not dare to attempt anything against us. In the very first minutes of a war imposed upon us we would come up against a superior adversary.

We should immediately say that there are no such dangers for the moment or in any direct way. Peace prevails along our borders.

Armor Does Not Help the Aggressor

The YPA is today armed and drilled so that it can oppose an attack by tanks and other armored forces, an attack from the air or landing from the air or sea.

First of all, no one can throw all his combat track vehicles exclusively against us. He can only set aside a minor portion of them for that purpose. Moreover, it is not possible for our country to be attacked with excessively large units. The terrain itself would break up the front of those units. It is enough to look at a map for one to see that we can be attacked only along certain operational-tactical or tactical routes. These routes are separated from one another by mountain ranges creating large intervals between them. Armored and mechanized forces cannot operate in

mountainous interspaces of that kind. There a soldier and the most modern army can be turned into an ordinary hiker. Our territorial and partisan units would settle accounts with them. Those units are both armed and drilled so that they can halt such an adversary and indeed more than that. They also have ways of fighting combat armored vehicles and even aircraft.

Over most of our territory any aggressor will have to channel attacks of his tanks and armored personnel carriers along relatively narrow routes. In places these routes are nothing more than canyons. That is why it is difficult to build up large forces in the first echelon. The major portion of those forces will have to wait for success on the part of those in front.

Our antiarmor arsenal is even today rather large and varied. Without claiming to enumerate everything, it is sufficient to recall the antitank shells with which we can shower all the routes of the adversary's advance, the bazookas with shaped-charge shells, recoilless cannons with shaped-charge shells, excellent antitank guns and other artillery, above all self-propelled artillery. To this we should also add our fighter-bombers and Yugoslav-made aircraft carrying missiles and napalm bombs to fight tanks. It is clear even today that we will soon be able to use our own helicopters in antiarmor combat. They will carry guided antiarmor missiles, which even today are possessed by every YPA ground force unit. These missiles are a calamity for advancing tanks. Seven years ago these missiles showed their strength in the war in the Near East. Today our own industry is manufacturing such missiles. There will be more and more of them in our armament. We will be able to hit a possible aggressor's advancing tanks with such missiles both from the ground and from the air. Since these missiles are guided, there will hardly be any misses. Even today we have so many of them that the commanding officer of any hostile armored unit would be afraid to count up the possible losses.

Picture of the Present-Day Battlefield

Anyone who goes on the offensive must move with tanks. Aircraft and artillery soften the defense so that the tanks can penetrate more easily. The infantry advances behind them. And only when the foot soldier's foot reaches a place can we say that it has been taken. But without the help of the tanks the infantry would be unable to advance, even mechanized infantry in armored personnel carriers.

That is why the attacker strives to facilitate the movement of his tanks and the defender to destroy as many of them as possible. And it should be said at once--there is nothing difficult about destroying a tank today. This can be done by any soldier armed with a bazooka. That is why the attacker strives with artillery fire and aircraft to force the defender's soldiers to be inactive, strives to destroy them or neutralize them. That is why artillery fire is laid down in front of the tanks and stays ahead of them every step of the way.

This complicates the picture of the contemporary battlefield. And the defender must respond with his own artillery--hitting the adversary with counterbattery fire. It is also helped in this by airplanes and quite recently by helicopters as well. The adoption of antiarmor helicopters as armament has just begun in many armies, above all the most highly developed, and in our armed forces as well. Our antiarmor helicopter has already been shown to the public.

Helicopters are today the great hope of antiarmor combat everywhere in the world. But it is clear even today that these clever aircraft can be driven from the sky. So even helicopters will not be able to attack on their own, at least not in large numbers. Even they will have to be protected not only by airplanes, but also by artillery. Yes, we did say what we meant, both cannons and howitzers--at distances of 10, 15 and 20 km. Artillery fire against an advancing tank column will force machinegunners in tank turrets to withdraw within the protection of the armor, and they will not be able to shoot at the helicopters. Today we possess artillery guns of that range. In addition to cannons and howitzers, there are also multiple-barrel rocket launchers, whose range extends beyond 20 km. We have cannons which are accurate even at distances greater than 30 km.

The Role of Our Own Tanks

In our list of antiarmor weapons we intentionally left our own tanks for the end. It is not our intention, and Comrade Tito spoke about this on several occasions, to immediately bring out our tanks into a frontal collision with the enemy, who at the outset will certainly be stronger with respect to the number of tanks. Only when artillery shells, bazookas, recoilless cannons, artillery, airplanes and helicopters--acting in concert with one another--do what is necessary, only then will our "steel fist"--our tank units--go into action against a weakened adversary. This, of course, applies to our larger armored units, but they are not the only ones in which we have tanks. Even many of our infantry units today have their own tanks for intervention in the most critical moments of the battle.

In other words, tanks are the backbone of the battle wherever routes are passable for tanks. And it is impossible to attack them or defend oneself against them without coordinated action of the different arms and also the different services. In the end victory will go to the one who is more skillful and faster in coordinated action, not to the one who has more of this or that. He who is numerically weaker can conquer a numerically stronger adversary--if he is more skillful, better trained, more flexible in command, and especially if he is able to utilize the advantages offered him by the terrain. And our terrain is such as to open up many opportunities for us to defend ourselves more successfully.

An attacker will not dare to rely exclusively on his armored forces. He will bring his artillery and also air force to help. It is certain that he will commence his war operations with air attacks. With attacks from

the air he will attempt to damage our transportation routes, to destroy communications centers and staffs, and to weaken the defensive strength of our military units. Of course, we will not be sitting on our hands, waiting. We have both the forces and the means of returning the strike. We will be striving to "pluck clean" those enemy air forces. Above all with the forces of our antiair defense, which possesses surface-air missiles and fighter-interceptors.

The reconnaissance service of our antiair defense, which possesses sufficient reconnaissance radars, sees far beyond our borders. It is able to alert all our units in time. Missilemen and pilots will quickly be in "number one alert" in every situation of any seriousness--and they can immediately commence action. Many of our cities and industrial installations are today under the invisible "umbrella" of our missiles. In other words, all air approaches are well covered by guided antiaircraft missiles. And all sizable units of the YPA, especially armored units, have their own rocket artillery units for air defense.

Sky Cleaners

Today we are neither barehanded nor weak in fighting a possible aggressor's air force. From the antiaircraft machinegun and multiple-barrel automatic cannon to the homing missile of the air-to-air type and especially the guided surface-to-air missile. This is our antiaircraft arsenal. We also have "homing missile carriers"--supersonic fighter-interceptors.

Fighter bombers and assault aircraft must fly at reduced speeds while seeking their target. It is rare for them to fly at speeds of 900 km/hr, though at great heights they can fly at even 1,500 or 2,000 km/hr or even more. If they want to find and hit an objective on the ground, they must reduce their speed below 900, 800, or even 700 km/hr. Some of the most recent aircraft intended for attacking ground objectives are not even capable of flying faster than between 600 and 700 km/hr, and they will be carrying out their missions flying at speeds of about 450 to 550 km/hr. Even fighter aircraft in the strict sense, whose purpose it is to intercept and attack other aircraft, no longer fly at high speeds. Their maximum speeds of Mach 2.5 are used only to bring them to the target rapidly or again to quickly disengage in case of an unsuccessful attack. All air fights between airplanes are conducted at much lower speeds--no greater than between 1,000 and 1,500 km/hr. The race for speeds has today stopped in aviation. The most recent airplanes are not faster airplanes. An effort is made for them to be more maneuverable in the air, even though they fly slower. In an air fight it is usually the more maneuverable airplane rather than the faster one that wins.

It is this principle which is honored by Yugoslav-designed and Yugoslav-made combat aircraft. They are not all that fast, but they can fight effectively even against a much faster adversary--unless he takes flight. And that in fact is our purpose--either to down him or force him to flee.

If enemy aircraft attempt to attack our units on the ground--they will have to reduce speeds from supersonic to subsonic. Then they are an ideal prey of our more maneuverable aircraft and also of our guns firing from the ground. We do have such guns. Not only the machineguns in the turrets of our tanks, but also specialized multiple-barrel automatic cannons. Among our fighting men are the well-known and highly esteemed 20-mm three-barrel automatic cannons made in Yugoslavia, which are virtual "sky cleaners" for everything that comes in their range.

Infantrymen Against Airplanes

Of course, airplanes may not come in their range. But then they will not be able to perform their combat mission--to spot and strike various guns and vehicles on the ground. Even if they themselves do not wish to come into the range of our antiaircraft cannons--they will have to. At high altitudes they are an ideal target for our guided antiaircraft missiles. For a long time contemporary air forces have been avoiding flights at high altitudes--wherever there are such missiles. They flee to lower altitudes, often they move even at the lowest speeds--hedgehopping. What awaits them, as if in ambush, are our small-caliber automatic antiaircraft cannons and, a particular hazard, small homing missiles which soldiers launch from their shoulders--which are also being manufactured by domestic industry.

There have already been situations in wars conducted in recent years, especially in the Near East, when the air force has been unable to operate. Attempts to overfly ground force units by surprise have been paid for dearly--by the loss of dozens of aircraft and pilots. It is no wonder that there have been theories to the effect that combat aviation is doomed, theories that nevertheless are exaggerated. It is certain that today even ground force units, including infantry units, have the capability to bring down aircraft. Our ground forces are no exception. On the contrary, every day they are more capable of fighting the enemy air force effectively, of inflicting serious losses on it, and of preventing it from clearing routes for its tanks. And it is a long time since we have been afraid of tanks.

What we have related here is only a simplified picture of a possible present-day battle. This is only a sketch, whose intention is to show that we have good opportunities for being successful with any aggressor. We have good people. We have long been known as courageous and resourceful fighters. Today we also have sufficient weapons, modern weapons, most of them made in Yugoslavia. That is why we can look with confidence at the possibilities of our successful defense.

PARTY OFFICIAL NOTES HOSTILE FORCES, CITES TRADE UNION ROLE

Sarajevo OSLOBODJENJE in Serbo-Croatian 26 Sep 80 pp 3, 4

[Excerpt from speech given at the 11th meeting of the Bosnia-Hercegovina LC Central Committee by Nikola Stojanovic, president of the Bosnia-Hercegovina LC Central Committee]

...[Following a discussion of the economic crisis, he says] There are problems, there are even explicit deformations. But it is exceptionally important to find the answer to the question of how one should and can fight against these problems and deformations. It can happen that self-management is left to the side in this struggle, that a "witch-hunt" takes place, that problems and occurrences are discussed in a sensationalist way, that certain problems are viewed only partially, and that one tries to solve them in a pragmatic way. In some way our class enemy is already selling these things through annonymous action, rumor, lies, half-truths.

The most effective way of solving all problems with which we are faced is doubtless the development of real self-management... One must clearly say that although we all are responsible according to the Constitution and Law [on Associated Work], we are not responsible in the same degree. One should not lose from sight in this regard the fact that the responsibility of members of the Central Committee is necessarily increasing.

Various hostile forces outside and within [the country] are making the judgment that at the present time there are opportunities for them to act against our country and the Socialist Republic of Bosnia-Hercegovina. They are being organized more and more secretly, so it is more and more difficult to uncover them. One can see in their actions the identical approach to certain phenomena and problems in our country and see the readiness to band together on this basis. Here are also the actions of clerical forces in all [religious] confessions which are constantly trying to manipulate the religious feelings of citizens. Although there are also encouraging processes which attest to the fact that they are not succeeding or that they are succeeding less than before, clericalist efforts in all confessions are nevertheless requiring even more political vigilance and action...

The conditions in which self-management is being created especially require that more consideration be given in the trade unions to the action of communists [the LCY]. One should always consider this on the basis of the Constitution and the Law on Associated Work. Communists must be engaged in making the trade unions an organization that the working class sees as its own organization to which they can turn for any question and be sure that, if a solution cannot be found in the action of individual institutions, the trade union federation represents a guarantee that it will organize the workers in a democratic way and seek solutions with them for that which is their constitutional right.

It is necessary that the Trade Union Federation be capable of thoroughly expressing the real views and interests of the working class, that is, that it consistently carry out its constitutional role and duties. This role will not be adequate if the trade unions wait for others, citing the views of the Party, class and working people as basic subjects of our social development. The concept which we have is certainly good but it should be consistently implemented. The practice in our republic is also promising. I am thinking here of those instances where the trade unions, based on the constitution, have placed themselves at the head of the workers and expressed the interest of the workers. When such practice prevails, we will be sure that the real problems of the workers will not be pushed aside, that anti-socialist and anti-selfmanagement forces will not be able to infiltrate and try to manipulate the workers, that it will not be possible to drive a wedge between the workers and the Trade Union Federation, nor between the LCY and the working people. In order for the Trade Union Federation to carry out its constitutional tasks, the action of communists in the trade unions is very important.

PREVALENCE OF WORK SHIRKING INVESTIGATED

Attitudes Surveyed

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1546, 17 Aug 80 pp 7-9

[Article by Toma Dzadzic: "Are We Encouraging Idlers?"]

[Text] Having been unable to find any other solution, the story goes, the director of the Napred construction firm in Belgrade, more out of frustration than seriously, proposed in a meeting of the work force that all the idlers be put in one office! At least then they would not interfere with those who are working.

In the opinion of Dr Neca Jovanov, who has been studying self-management for many years and is a professor of self-management at the School of Engineering Science in Novi Sad, one can prove that idleness has reached its highest point with us precisely in these last 2 years. Neca Jovanov emphasizes that he is not referring here to idleness as a negative character trait, but is speaking of various forms of passive resistance on the job because of what he calls "failure to realize the promise made several years ago that the workers would have decisive influence on the conditions for creation of new values and on overall distribution of that value."

Proceeding from the fact that idleness is becoming a real menace in quite a few collectives, our research center conducted a survey among some 100 workers in a dozen work organizations; several questions were asked, but they come down basically to this: Are you encouraging idleness? Judging by the answers, the questions were not pointless.

The great majority (85 percent of the respondents) are of the opinion that idlers are one of the big troubles of our society: "This is like a natural disaster," was one of the many responses. Another one was this: "No, the idlers are not the biggest problem--they are a consequence of poor incentives, of hit-or-miss assessment of the abilities of individuals, and of imperfect organization."

In all these 100 respondents there were just 4 who did not think that what we referred to as idlers are a problem one should be disturbed by.

So, an awareness of the harmful effect of idleness is highly developed, but the respondents differ about how this trouble should be combated. The respondents can be put in three groups on the basis of their answers:

By far the greatest number of them favor more severe penalties, warnings and similar methods. In first place were answers like this: "They should be punished, they should be hit in the pocketbook, and they should be expelled," or: "If the idler saw that his colleagues were earning three times as much as he is, he would start working on the spot." We find among the answers some with observations that only appear to be illogical: "There are incentives for idlers, not for workers."

The question "Are there any other ways (not being used) to force the idler to work like other people?" was answered even by an extremely pessimistic conclusion like this: "No, there are not, everything has been tried, they are indestructible, unrestrainable and have a corrosive effect on others." In response to the same question one person sketched the mace of Kraljevic Marko. The psychologist would call this group of respondents traditionalists, which means that they are people inclined to resolve things by the tried and true methods of pressure.

Whereas they (the respondents) are unanimous that there are idlers (most of them, they say, in nonproduction areas) and that this is a serious problem in our society, they differ utterly on how this should be solved. The grouping of workers labeled traditionalists (and in this case they represented more than one-third) leaves that satisfaction to their superiors. They also think along the lines of "no one is responsible for combating idleness," and there are few of them who call for the forces of self-management to have the decisive role.

Not even all the superiors are immune to idleness, judging by the responses of a majority of the respondents. A typical answer to the question "Are there idlers even among the supervisors?" might be: "Are you kidding! That's their breeding ground."

And thus we arrive at the main question: "Why don't the idlers work like the rest?" Most of the persons surveyed feel that these are lazy individuals and that the workplace environment allows them to do this: "Actually, no one is forcing them to work," "It is difficult to discipline people without conscience," "I don't know," "It's certainly not up to me." Then it is said that the idlers are dissatisfied with their personal income, but also that they are a product of poor organization of the work. The answers range over a broad scale all the way to "It is a question of personality--if a man is honest, he works."

However, if we judge by the answers of those surveyed, those who do not work or work little feel absolutely no consequences of it either in terms of their personal income or any way. And why should they when quite a few of those surveyed feel that unfair distribution of personal incomes in their basic organization is involved. (Personal income depends "on friendship," "on God-given talent," "on personal evaluation," "on the banditry principle--take as much as you can," but it also depends "on work done," "on actual results of work insofar as the work is easy to measure as is the case with production jobs.") But it is significant that a sizable number of the respondents feel that personal income does not depend a great deal on work.

In that kind of atmosphere it is not unusual for a good third of the respondents to feel that their colleagues and superiors regard them as exceptionally good workers. There are many more of those who perceive themselves as average, and an almost negligible number of those who do not have a high opinion of their work. So, the idlers--they are always "somebody else."

In answer to the question "How do fellow workers behave on the job toward the idlers?" a majority say that a noncommittal attitude is maintained: "I don't interfere so as not to make my life bitter to no purpose," "I tried to bring the thing out in the open, but I only aroused ill feeling." All the respondents say that "they" (fellow workers) and not "I"--talk about the idlers behind their back. One might say that in this case hypocrisy is developing successfully.

"Actually, evaluation of work is a complicated calculation, while opinions are unreliable, and the idlers portray their idleness as work," is how the sociologist Slobodan Bakic, senior researcher in the Institute for Sociological Research in Belgrade, presents this phenomenon. According to him, everything comes down to interest bargaining on the internal market for work, and that is the swinging of votes concerning the contents of the regulation to be adopted in the future. "Even when a good regulation is drafted, it is not adhered to," Slobodan Bakic says, adding that if someone does 2 hours of effective work and manages to represent it as 8 hours, he is the winner.

What he means is this: everywhere there are shirkers known to everyone in work organizations, it is just that no one puts their finger on them. Bakic sees this as a false conception of solidarity. That is, Bakic feels that most people prefer to earn their guaranteed 6,000 dinars without much effort than the 9,000 dinars that are accessible, but uncertain, which they might earn i they really were rewarded according to the results of work.

He interprets this as the psychology of mediocracy or leveling: better for us all to have 6,000, 6,500 and 7,000 dinars than some to have 10,000, others 6,000, still others 2,500, and yet others to discharge because of idleness.

This kind of deep-seated egalitarian atmosphere does more harm than good. This past week we saw on television the case of a director in Slovenia who simplified and considerably speeded up the production process in a textile factory and thereby saved the enterprise enormous amounts. Nevertheless, he did not dare to take the award of 2 million dinars granted him. This man is obviously afraid of the judgment of the public: what will people say if a man accepts that kind of money in a socialist system (though it was honestly earned)?!

We are not accustomed for the more able people to stand out, at least not in terms of personal income. Let them work as hard as they like, but they are not to earn much more than us.

And while no one has yet appeared to encourage the director and innovator from Slovenia to take what he is entitled to, we are rather inclined to laugh and stigmatize the case of the male construction worker from Maribor who was on sick leave for having received (on doctor's orders) medical treatment--an abortion. Thus, thanks to the doctor's confusion--probably they have run out of reasons for their patients' absences from work--our false sick leave has reached the point of being grotesque. Last year alone Yugoslavia had a total of 84 million workdays of absences, and those are only the ones recorded. We can only guess how many of these sick people were hale and hearty.

Cedomir Jeftic, chairman of the Federal Committee of the Trade Union of Yugoslav Metal Manufacturing Workers and a member of the Presidium of the Council of the Federation of Yugoslav Trade Unions, who cited the figure given above, believes that the irresponsible attitude toward work and work duties is also one of the principal causes of economic instability. In his opinion this kind of work discipline results mostly from poor organization of work. It is not, he said, the workers who are responsible for this, but the organizers of work.

Jeftic points to the inappropriate system of distribution according to work as the second reason for the reproduction of idlers. "Aside from the tendency toward leveling, there is still a prevailing fear of large differences in the level of personal incomes," he says. He also finds that various "social welfare measures" contribute to narrowing the range of income between the best paid and the poorest paid. All of this certainly acts more as a disincentive on the good workers than an incentive on the others.

"What good does it do to talk when the idlers are protected even by law!" says one of the respondents. When this opinion was passed on to Dr Aleksandar Nikolic, professor of self-management practice at the School of Law in Kragujevac, he reacted categorically:

"That is not accurate: our laws are very democratic toward honest workers and self-managers, but very strict toward idlers. The measure of terminating the employment relation can be pronounced as never before because of

many violations of work duties, self-management obligations, and other obligations (because of refusal to execute work orders, for coming to work intoxicated, because of absence from work, and so on) so as to disrupt or considerably hamper the work process, that is, inflict a loss on the work organization."

We might mention only that in some cases of a serious violation of work duties, as Professor Nikolic explains it, the work organization is required by law to discharge the worker. In Serbia, he told us, a worker must be discharged if he is absent from work at least 5 successive days without justification or 7 workdays not in succession during 1 month, or 15 days over a period of 3 months.

Neca Jovanov finds the origin of passive resistance lying deep and a bit further back in the past--in the fact that workers have lost confidence in the declaration repeated for 10 years or more, but not implemented, that they themselves would dispose of all the income, and not merely personal incomes.

There is, he says, the book income and the real income of the basic organization, and when all these compulsory payments are made that do not depend on the desires of the workers, the difference between those two incomes is like the difference between a bear and a flea.

Jovanov says that the political power of institutions that serve as intermediaries and which are only nominally called self-managed special-interest communities, banks and the like, has grown. The principle that everyone should divide up as much as he has earned, he feels, is nothing more than a good intention. In his opinion, this is the road toward disloyal competition, that is, to the social and political disintegration of the working class. He feels that there is an enormous discrepancy between the creative potential and the available means of paying people appropriate rewards for demonstrated creative ability.

Neca Jovanov recalls the well-known saying of the idler: "You can never pay me so little that I can't work less." At the beginning, supposedly, people worked little on this basis: "You do not want to pay us as much as we are able to create." Later, this idea was transposed into something equally accurate: "You cannot pay us as much as we are capable of creating because you have spent most of that money still unearned for various investment projects at least some 10 years in advance. And however much we create, you will take it away, since you have already spent it on the basis of your own decisions that lie outside our power. We are not motivated, then, even to develop our creative abilities, nor to display them, since we will still not get anything."

At this point we can conclude our study, which, of course, by no means exhausted the topic we raised. It is because of its urgency, since stabilization cannot be imagined without more productive labor, that we will be

continuing these talks in various journalistic forms, since there is obviously a need for public interest.*

Disincentives in Pay System

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1546, 17 Aug 80 p 9

[Article by Scepan Rabrenovic: "Dense Leveling"]

[Text] There have always been more idlers when there were fewer motives for higher earnings. It happened, as it happens even now, that a worker would receive the same amount of money in his pay envelope regardless of his output. Numerous studies have already shown that absenteeism is lower in work organizations with fairer distribution of income.

The longer such a period lasts, the poorer are the overall results of business operation. One such period is taking place right now, it began at the beginning of last year, and no one knows when it will end.

That is, last year real earnings did not increase by a single dinar over the previous year, though labor productivity was 3 percent higher. How could this have happened? Work organizations decided to economize, and they can economize only in those areas where they have an impact.

The situation is still more serious in the first months of this year--labor productivity was up 2 percent, and real earnings were down 9 percent from last year. At present no one knows how long this situation will last, but one thing is known for certain: we will not be able to carry out the stabilization program with lower real earnings.

Just as we also know that leveling in distribution does not act as an incentive. It is true that by saving on earnings the economy did enrich its funds last year, but it is also true that leveling became still denser. After all, in a situation when real personal incomes are growing slower than labor productivity, it is normal for those with the lower incomes to move upward, and thus it happened that last year 41.8 percent of all employees were somewhere near the average personal income (between 5,000 and 7,000 dinars).

Not only did earnings crowd close to the average, but compared to 4 years ago the income span in the economy has been considerably reduced. Here is

---

* The respondents were employed in the following work organizations: IKL [Antifriction Bearing Industry], IMT [Machine and Tractor Industry], MPI [Milling and Baking Industry], the Serbian Republic Economic Chamber, the Beograd department stores, Jugoslavijapublik, the Yugoslav Authors' Agency, and the Beograd Hairdressing Cooperative. The interviewers were the following: Ljubica Stavric, Nada Petronijevic, Svetlana Kasalovic, Milenko Toskovic and Zorica Knezic--under the supervision of Ljuba Stojic.

the evidence: last year in about 20 percent of the work organizations the range between the lowest and highest personal income was barely 1:2, and in about 30 percent of the work organizations it was barely 1:3.

Last year only 3.6 percent of work organizations had differences in earnings over a range of 1:5, and only 2.1 percent of the work organizations had an income span greater than 1:6.

This kind of dense leveling, which respects neither knowledge nor abilities, nor even concrete results of work, and the fact that real personal incomes are tied down at a level which is lower than the rise of labor productivity--are considerably detracting from the motivation to work, which means that they are actually an incentive for idleness.

WEST GERMAN COMMENT ON ECONOMIC CHANGES

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 29 Sep 80 p 12

[Article by Viktor Meier: "Yugoslavia Not Out of the Woods After All--Illusion About Economic Prospects Vanishing"]

[Text] Belgrade, September 1980--Despite its supply problems, inflation, its great debts abroad and a number of other economic failings, Yugoslavia, with its semimarket economy system, is still far better off than most of its "strictly" communist neighboring countries. The only problem is that the Yugoslavs thought that by and large they were out of the woods, and now they have to go back again. This makes for an utterly different psychological and political situation.

The Root of the Evil

The debate about why the country's economic situation suddenly has taken such a turn for the worse is suitably extensive and acrimonious. There seem to be as many different opinions on this as there are Yugoslavs. Among ordinary people, some say that it really is peculiar that everything was all right "under Tito," while others point out that the country wasted such a great deal under Tito that there is nothing left today. Either interpretation can cause political difficulties. Perhaps this is one of the reasons why the present leadership is permitting the Tito cult to recede gradually. Comparisons between past and present are always and in every way a delicate matter. Evidently there is a desire not to do anything to provoke them.

In "more enlightened" circles, opinions vary primarily about the extent to which the "system" has to be blamed for purely economic facts and for the poor economic situation. Bureaucrats and other "official" spokesmen incline toward drawing the foreign visitor's attention to the surface of things. They say that investments were overdone and that one is now faced with innumerable half-finished projects and that it often is a difficult dilemma to decide whether completion or "preservation" entails the greater loss. Others emphasized the fact that investments have been inadequately "coordinated" between the various republics or municipalities and that this resulted frequently in "double capacities."

At the National Bank the emphasis is on foreign economic factors. Import prices, it is stated, have risen far more than the prices of exported goods, the "flood of imports" had been ignored too long, and perhaps, because of Tito's illness, the devaluation had been delayed too long. The people at the National Bank are not prepared to attribute the most important role to the low export factor of the Yugoslav economy. Rather, they believe in the purely mathematical automatic formula of "lower domestic demand, higher exports," finding their view confirmed in part by the results of the first half of 1980. The governor of the National Bank, Bogoev, is definitely against any new devaluations. The "apparatus"--if one wants to use that expression--thus rather inclines toward administrative restrictive measures, partly even long-term administrative economic-control measures. These are more comfortable for the administration because they neither require imagination nor make it necessary to engage in the politically delicate action of disturbing the "system."

Meanwhile the debate in the newspapers, among economists and even to some extent among politicians is moving in another direction. Summing up a widely heard opinion, Professor Horvat writes in DUGA that the root of the present evil is the fact that in the last big reform in 1965 and then once more in 1970 self-administration was not given a chance at all. Instead of giving enterprises complete freedom and only using economic means to press for certain general objectives being observed, government administration of the economy had been replaced by a "paragovernmental alternative," with self-administration being but an outer form, and the content "interventionist." This had been the meaning of all the various "agreements," "associations" and "accords" which had put the enterprises in a net and deprived them of any freedom of actions. Professor Horvat could have added that after 1972 the party had also definitely again "taken over" the self-administration. Horvat says that the system of self-administration must be based on a "stimulative incomes policy." In doing so, he cites the authority of another prominent economist with invariably independent views, Professor Bajt of Ljubljana. Horvat charges many Yugoslav economists with saying what the politicians want to hear. For 10 years now, he says, every year some sort of "program of stabilization" had been put forward; what was needed was for once to make a radical change.

But this is precisely what is likely to become difficult. True, many politicians talk about the need to strengthen the "market forces" and "self-administration" and in addition definitely reject "administrative measures" when it is, for instance, a question of introducing ration coupons for scarce goods. In practice, however, nothing happens, and supposedly "transitory" restrictions prevail exclusively. Nothing is happening even in agricultural policy, which to a large extent is responsible for the difficulties in supply at least of domestic produce; only the provisions about the upper limit of landownership and such like are to be applied "in a more liberal manner." This political impassiveness and the fear of "stimulation" and "liberalization" insures that the Yugoslav crisis, which cannot be compared to past recessions, is going to continue for a long time. The only thing of which the politicians are afraid is that the supply problems and the reduction in incomes (there is talk of 5 percent and even 10 percent this year) will create political problems. This is the main reason today for the universal call for an end

to the wage freeze. Price regulations for enterprises are also being weakened, with individual politicians in the republics stating right out that they would immediately arrange for the import of food if the population should be faced with acute shortages.

Political Factors

The Yugoslav National Bank, which constitutes something of a proportional association of the republics, evidently has not got the strength or, for that matter, the authority of, say, the National Bank of Hungary, which has direct control over the finances of the enterprises, decides about loans and engages in the promotion of exports. The governor of the Yugoslav National Bank is an economist, and his political position in the power apparatus is not very strong. Strictly speaking, so far the control over the Yugoslav monetary and credit system has never been in the hands of the National Bank but rather always in the hands of the political factors in the nation, in the republics and even in the municipalities.

These by and large have controlled the commercial banks, granted credits and in turn have kept the enterprises on a leash. To a large extent, enterprises were deprived of funds of their own and the freedom of making investments. In summing up one's basic impression, one may perhaps say that in Yugoslavia for 10 or even 20 years, through the whole period of development, there has been a neglect of the monetary factors and inadequate use of them to control economic events, including investments. If a National Bank that is also strong politically had been in charge of a credit policy, this would not have amounted to "centralism," but, on the contrary, economic laws would have been allowed to take full effect and, the chances are, in this way investments would have been under better control and inflation would have been held in check as well.

It is not by accident that the theories of so-called "monetarism" are gaining increasing attention in Yugoslavia these days. True, there is little prospect of the books of Milton Friedman replacing those of Karl Marx as obligatory school textbooks in Yugoslavia, but at least Milton Friedman is no longer official anathema, and his writings and the applications of his teachings are being studied with interest. Before British Prime Minister Margaret Thatcher came to visit Yugoslavia last week, Yugoslav television in an interview gave her ample opportunity to speak about her economic ideas. What she had to say about dealing with unprofitable enterprises and unproductive labor unwilling to do anything to raise productivity was followed with interest and gave food for thought to many Yugoslavs, including people holding official positions.

WEST GERMAN COMMENT ON ECONOMIC-POLITICAL TRENDS

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 25 Sep 80 p 12

[Article by Viktor Meier: "Something Is Stirring in Belgrade--When Will the Economic Difficulties Also Become a Pressing Political Problem?"]

[Text] Belgrade, September 1980--One can read at present remarkably frank articles in Yugoslav papers and journals--particularly about economic questions but also about other problems. The journalists no longer have much respect for the taboos of the system. Particularly the journal NIN stands out in this, but also BORBA, which is still considered a party organ, the Slovenian DELO and to some extent the Zagreb VJESNIK. POLITIKA, the old principal Serbian paper, is still exercising reserve, perhaps because of its close ties with the Serbian leadership. In the Yugoslav parliament as well, discussions are becoming increasingly frank, even if generally only concerning minor questions and often unsystematically--probably because of a lack of parliamentary tradition.

Evidently certain doors have opened in Yugoslavia. "Something is stirring," one can hear people in Belgrade say. There are two interpretations as to the causes of this. According to one thesis, this opening of doors can be traced to a group of politicians taking up positions for a struggle for power; or it is simply that "there is no one any longer to keep the doors closed." Most observers incline toward the latter interpretation. One cannot escape the impression that "at the very top"--in other words, in the "collective leadership" and its organs--a political vacuum and lack of action prevail. This is particularly true of economic policy, which now clearly has become the most urgent national problem.

In a recent interview NIN confronted Premier Djuranovic with a remark by the late Edvard Kardelj to the effect that many systems simply had collapsed owing to their "material dissonances." Of course Djuranovic rejected the thought that this was true of the present Yugoslav system, but over long stretches his utterances impress one as rather nebulous and helpless; aside from his promise that there had to be "an end to the old

politics," he had hardly anything concrete to say about the future. Since there is little impetus from the top, more leadership tasks than before are falling on Djuranovic and his Executive Council, manned partly by realistic economists. Meanwhile one gets the impression that Djuranovic is only having partial success, particularly vis-a-vis the republics, with his economic initiatives, which, presumably in the interest of the administration, are often tinged with a central-economic-planning approach. Thus the effect of the devaluation is petering out without any constructive corollary measures pointing toward the future.

Economic difficulties and lack of action by the government are a combination which generally has political consequences both in the West and the East. Sooner or later, the chances are, the poor economic situation, including the supply difficulties, are probably bound to have a political effect. This would then be the first time in the history of Yugoslav communism for the impetus toward political change to come direct from the economy. How this might happen cannot really be predicted for the moment. It might come to a split in the leadership, or one day the workers might simply lose their patience. In both cases the national problem may become acute.

Developments such as in Poland can hardly be expected in Yugoslavia for the time being. In Poland the workers' dissatisfaction with wages and supply had a direct effect on the state and the regime, without any responsible organs in-between. In Yugoslavia there are the intermediary organs of self-administration in the enterprises. People one talks with in Yugoslavia think that the people's dissatisfaction over the lowering of standards of living will at first devolve on these organs, with one director after another likely to be removed from his post. Objectively speaking, this seems hardly justified, for the very cause of today's poor economic situation in Yugoslavia seems to be the fact that, contrary to the idealistic view of so many political and social analysts in the West as well, self-administration never became reality at all. This is definitely the opinion of respected Yugoslav economists, such as Prof Branko Horvat writing in the journal DUGA. The authorities, however, are likely to participate enthusiastically in a crusade against the directors because it would divert attention from their own responsibility. The party and its exponents have always regarded the economic managers as unwelcome and dangerous competitors against their striving for power. As early as after 1971, while Tito was still in charge, there was a big campaign against the managers, against the "technocrats" with "liberalist tendencies." One day, however, the political machine of the regime is also likely to find itself in the direct line of fire. There will then either be profound, perhaps revolutionary, changes in the nature of the regime--or there is the danger of the country going under as a result of problems and conflicts.

At the present time the republics are playing a big part in Yugoslavia--according to the opinion of economists such as Professor Horvat, a

divisive one, however. In Horvat's view, they are cultural and also political but not economic entities. In fact, he says, they must not be economic entities if Yugoslavia wants to adhere to its important national political premise of a united market. Yet, according to Professor Horvat, quite a number of economic stability measures, not least wage agreements, are drafted and effected within the republican framework. The republics also have their own foreign currency accounts.

The political leaderships of the republics are strong. The phenomenon of the "Titici"--the "small Titos"--against whom Edvard Kardelj had warned before his death, at present is most apparent in the republics. A typical example is Slovenia with its party leader Popit. As if to mock the whole constitutional debates about the duration of tenure of heads of government nationally and in the republics, Popit without ado dismissed his Premier Vratusa, replacing him with his minister for police because people with "operational qualifications" were needed. Meanwhile it has become known that there were yet other reasons for Vratusa's dismissal, having to do less with Vratusa's qualifications than with Popit's personal ambitions for power and also perhaps those of some other high officials of the "old guard" in Slovenia. In 1971, following the forced resignation of the then Slovene head of government, Kavcic, Popit had been made party secretary by Tito personally. Under Popit, Slovenia obediently toed the central Belgrade line, the "Tito course," and until a short time ago it forwent making substantial demands of its own. As a result the Slovenian economy now is antiquated as far as its machinery of production is concerned. The Slovenian steelworks are not in good standing. The top manager of the internationally respected Gorenje firm was let go at Popit's bidding because he had become too pwerful for him. Now, after Tito's death, Slovenia has put forth a proposal henceforth to recognize only Kosovo and Montenegro as underdeveloped Yugoslav territories and, in addition, to have aid go to them direct from the republic or autonomous area concerned. Thus the "Titici" are now also asserting themselves on a national scale. They--Popit, for example--will have little use for the requirement to give freedom of action to the economy at long last and to abandon its politicization.

RECENT INSTANCES OF POLICE BRUTALITY DISCUSSED

Serbia's Interior Secretary Comments

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1547, 24 Aug 80 pp 8-10

[Article by Zvonko Simic: "The Blow Did Not Come From Heaven"]

[Text] Alija Toskic, 22 years old, died in early July in the police station in Priboj na Limu. Three members of the opstina law enforcement agency were arrested and are awaiting trial. Others were suspended, and the head of the opstina law enforcement agency and commander of the police station have submitted their resignations.

At about the same time a traffic policeman insulted and humiliated a newsman of POLITIKA EKSPRES following a traffic violation. He was suspended. His fellow policemen have sharply condemned his action, and the Belgrade municipal law enforcement agency has instituted disciplinary and criminal proceedings against him.

These two incidents cannot be compared in either seriousness or consequences. What they have in common is only that four irresponsible men in uniform obviously abused the use of force, which under regulations they have the right to use only when the situation calls for it. This type of abuse, to which the private citizen is particularly sensitive, has occurred from time to time. In Priboj it was particularly serious. Why do such things happen? Who are the people who commit them? How frequent are these undesirable arguments in contacts between police and individuals?

NIN took these questions on a visit to Viobran Stanojevic, republic secretary for internal affairs of the Socialist Republic of Serbia.

"In Serbia we have a good police force, and I am satisfied with its work," the republic secretary said. "Among the several thousand law enforcement officers there are irresponsible and willful individuals who exceed their authority, just as they exist in other occupations. We dare not identify the force with individuals nor judge it by them. Quite a bit has been said

about the case in Priboj. What could and should be done before the verdict of the court has been done, and the court will make the final judgment about those directly responsible for the death of the unfortunate young man and about the degree of guilt of each of them individually. Public analysis of the case on my part before the verdict of the court would constitute interference in someone else's jurisdiction, and would be a prejudicial act.

"I must say that the law enforcement service in Serbia, as indeed throughout the country, performs even the most complicated tasks successfully, thanks above all to the exceptional cooperation with the public. The intolerable case in Priboj is casting a shadow on that relationship, and we on the force are taking steps so that nothing like that ever happens again.

"The republic secretariat, together with senior officials from joint secretariats for internal affairs, opstina secretariats and commanders of police stations, is striving to use this unpleasant case as a lesson and warning, as an impetus for a kind of mobilization against violation of the laws and regulations on the force.

"In my opinion," the republic secretary continued, "the main question is whether the people who wear the uniform and carry a nightstick and a weapon come to understand that violence can be applied only when envisaged by law. And the law and service regulations specify precisely when a policeman is allowed to use his pistol, his nightstick or physical force: only when resistance is offered to law enforcement officers and only when that resistance persists: or when the interests and rights of citizens, personal and public property are threatened, or there is a danger that cannot be eliminated without the use of force. The policeman must submit a report to his superior on every use of force. In recent years our statistics show that the use of force is on the decline, that the abuse of coercion is also on the decline, and that excesses in which policemen are the victims (assaults and insults) are on the decline. On that basis I could conclude that the situation today is better than yesterday, and I have reason to hope that tomorrow it will be better than today."

Over the last 3 years the means of coercion (firearms, rubber nightstick, and physical force), according to figures of the republic secretariat for internal affairs, have been used on 772 occasions in 1977, 713 occasions in 1978 and 670 occasions in 1979. In between 95 and 97 percent of the cases the use of force was judged to be justified, but it was felt not to be justified in between 3 and 5 percent of the cases.

At the same time every year charges are filed for between 70,000 and 60,000 violations of public peace and order, more than half of them involving fights and violent behavior. A simple comparison of the figures suggests that on the average coercion was used only once for every 100 cases of violations of public peace and order. Nor were certain other violations and crimes in which the sporadic use of coercion can also be expected included

in this calculation. Probably altogether--both the general public and the police--we are not exactly the kind of kindergarten that one might conclude from those figures.

But if a certain reserve can be shown toward the absolute figures on the use of coercion, it seems unquestionable that its use is declining from year to year. This conclusion is fully in accord with the figure that the number of assaults on "authorized officials," as it is put in the reports, is decreasing. The year before last there were 190 such assaults, and last year only 165. Previously there were many more of them. Some nine men were seriously injured and 113 slightly injured in these conflicts.

Other figures suggest that the force is tightening its attitude toward its own people who are too ready to use force. In 1977 12 persons were prosecuted--in either disciplinary or criminal proceedings--for exceeding authority in use of means of coercion, the year after that 19, and last year 27. Last year six were in fact discharged for that reason. In all of 1979 349 members of the Serbian Republic Secretariat for Internal Affairs went through disciplinary proceedings because of all types of violations, and that is one-fifth more than in the previous year.

The head of the secretariat for internal affairs in a small opstina has shed light on the problem from a special angle. "I have four men who I wish had chosen some other occupation," he has said. "But of the 38 job slots envisaged by the organization chart, only 21 have been filled. If I were to insist on the discharge of those four, then we would have only 17. And I cannot perform the tasks assigned with so few people."

In Serbia proper there is a shortage of almost 20 percent of the police force. But in some opstinas the shortage amounts to more than half of the force. Belgrade, where 88 percent of the job slots are filled, is still in the best position.

By force of circumstances this force, which is never fully staffed, has assumed certain obligations and duties which it should not be involved with. Why should the police have the burden of responsibility for drivers' tests? It is best for the examinations to be organized by those who run the schools: Red Signal, Akademac, the Automobile and Motorcycle Federation, and so on.

If a customer in a restaurant gets into an argument with the waiter about the check, the latter will first call the policeman on the beat. And now he must leave his beat where there are three banks and 50 stores in order to argue about whether it was five or seven glasses of wine with soda water. Or to intervene when a drunk comes up to a table and drinks off someone else's bottle of beer. Or to take up his station next to the line for coffee so that nobody moves up two places from where he should be in the line. It would be better if this were done by people from the consumers' council or the council of the local community. There are few restaurants

and bars who have employed a former athlete with enough strength and sufficient authority to be on hand if an unruly customer needs a peaceful but resolute reminder: "That doesn't go in our place." And the policeman would be called from his beat only when the situation could not be controlled and if an incident with serious consequence was threatening. The tasks of the entire force and the job of each individual in it are quite difficult, complicated and delicate. It would be better for the force to be relieved of secondary matters, which can be done by others, so that it can devote itself fully to the main things.

"The private individual need not know about our personnel and other difficulties," Viobran Stanojevic said. "It is up to us to consistently combat violations of service regulations, and the service itself requires that violations of public peace and order be combated vigorously, but also that a civilized and decent attitude be taken toward the individual, so that either we will break the habit of that individual who is inclined to such violations, or he will go to some other job outside law enforcement. We are now doing both."

It seems that unprofessional behavior is at the heart of most incidents involving abuse of physical force. An experienced man is not going to get into a contest with a group of drunks brought in because of nighttime disturbances. He will leave them in the lockup to calm down and sober up, and in the morning they will discuss the problem "coolly."

"Experienced policemen are rarely involved in incidents involving abuse of force," the republic secretary said. "Much more frequently they involve young men just beginning their career, who have just come from school, who have not yet become integrated into their new environment. They need the help of the League of Communists and the youth organization so that they 'become active,' say, in the council of the local community, in the youth organization, in the work of some cultural or athletic society, and there they would get what the school was unable to give them. All of us together should do everything we can so that the young man carrying a firearm and a nightstick is not left alone on the pavement, and we should always bear in mind the specific nature of the tasks of law enforcement officers, who if necessary work continuously for 24 hours and who perform tasks even at the risk of their lives."

Motorists know from experience that after a traffic accident they have their best chance with traffic police if they make themselves smaller than a poppy seed. They also know that now and again a man in a blue uniform will take their running of a red light as a personal insult and failure to respond to his whistle almost like a physical assault on himself and the uniform he wears.

The policeman's identification with the service he performs also has its good side, as an element of zeal, but it could have very bad aspects if it becomes that well-known attitude "the government--that's me." Probably

there is no need to convince anyone either in the service or outside that the police, law enforcement agencies, and the security forces are not the government, but a social service similar to the school, the heatlh service, the courts.... Work in that service is very strenuous, very complex and very responsible. Often it is not able to get all the people it needs, nor always the right people (the republic secretary said that the Yugoslav police force is one of the smallest in the world in terms of the size of the country's population). But the mistakes it makes are always in front of the public's vigilant eye.

Most often these are occupational mistakes by individuals at critical moments, people who either mistakenly evaluate the public interest as provided for in regulations, or who neglect it--violating the regulations outright. It is in no one's interest, say, for them to risk their lives over stolen cars.

One "borrower" caught in the act recently in Belgrade, was hit by a pistol shot when he wanted at all costs to escape the patrol which had forced him into a blind alley. If we are to believe the newspaper reports, the policeman recognized him, since they had had dealings with him before. They might have arrested him somewhere else, perhaps at home, under less dramatic circumstances.

In private conversations many of our people would close one eye or even both about use of the nightstick against criminals to get a confession or for other reasons. The roots of this go back into folklore. It is said: "Whipping was not invented in paradise." Or: "It is not God that every good-for-nothing fears, but a beating." Modern pedagogy, and even modern criminology, however, say that violence begets violence. Those who have been beaten later are ready to inflict a beating themselves. Or: those who do the beating have themselves been beaten. Even if we leave aside for the moment the notorious fact that the criminal has the right to civilized treatment in accordance with regulations by law enforcement authorities, just like any other citizen, there is something else which remains. When the regulation on use of the nightstick is violated against a criminal once, three times, 10 times, with no consequences, this becomes a habit, and on the 11th occasion the victim will be an individual who can by no means be classified among those on the wrong side of the law.

"Both as a man and as a lawyer I do not approve the use of violence as the principal means of maintaining peace and order," says Viobran Stanojevic. "There is no justification whatsoever for use of force outside the law and regulations. The nightstick is the last resort, just as the police is the last barrier to crime. As for forced confessions, even a voluntary confession is not proof in and of itself, and so much the less when it is made under pressure. We must put our belief in knowledge and in the law, and not in beating. We must put our trust in correction. The saying that whipping was not invented in paradise sprang up in an environment in which there were neither schools nor laws. It is outdated for the conditions of

our time. At the same time, I would also like to add that the policeman can escort a child across the street, but his parents, the school and society must give him guidance in entering life."

The republic secretary said that the policeman has no reason whatsoever to take anyone's violation as a personal insult. Unfortunately, there are some young people in the service, as is the case with young people anywhere, whose feelings often run ahead of their minds, and altogether unnecessary incidents take place. The secretary said that strict respect for regulations on the use of force, as indeed in all other matters, depends mostly on the superior officer: "The character of the company reflects the character of its commanding officer."

"I believe that in the foreseeable future we will bring the human factor altogether up to the plane of strict and literal respect for the law," said Viobran Stanojevic. "The service will perform its duty with maximum responsibility, and it will also make a maximum effort for those who violate the law, regardless of what kind of offense is involved, to receive what the law provides."

New Accusation

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian No 1548, 31 Aug 80 p 22

[Article by Zvonko Simic: "How Much Is a Confession Worth"]

[Text] The Belgrade enterprise Zvezdara has an establishment at Viline Vode. A theft occurred there. During working hours 3,100 dinars were stolen from S. T., a laborer. The money was in his wallet, the wallet was in his trousers, and the trousers were in a locked locker in the worker's shed. S. T. later said that the door of the locker had been forced, probably with some pajser, and that the lock was put back in place as though nothing had happened.

Immediately before he noticed the theft, S. T. came upon S. B., a fellow worker, also a laborer, in the shed near the locker. He appeared to him somewhat confused, and his suspicion fell upon him. He reported the theft to the police.

Contusion and Hematoma

The next day a patrol came for S. B. It was Saturday. An inspector interrogated him in the police station. S. B. confessed the theft to him, wrote out and signed a statement to that effect in his own hand and promised that he would return the money as soon as he received his pay (about 3,500 dinars monthly).

On Monday S. B. told his fellow worker from whom the money was stolen that he had confessed the theft to the police because they beat him and that he would return him the money (which he did subsequently do in the presence of "his" inspector). Also on Monday S. B. went to his local health care center. They found that he had a contusion and hematoma (bruise and effusion of blood, put more simply) on the left side of the chest. Starting with that day he was on sick leave for 18 days.

The public prosecutor filed charges against S. B. for grand larceny. Before the court he renounced the confession given in the inquiry. "I confessed because the inspector beat me," he said.

The court called the inspector to the witness stand, though defense counsel objected: "Show me the inspector who will admit that he has beaten a suspect!" The inspector told the judge that he had behaved toward the accused in a fair and proper way. The court confronted him with S. B. Each, of course, stuck to his own story.

The inspector also said before the court that he had not gone to the scene of the crime. Consequently, he had not seen the broken locker, so that he could not know how it was broken into, nor in the end even whether it had been forced open at all. "For me as the officer conducting an inquiry it is sufficient when someone confesses," he said in the trial.

Nothing Aside From the Confession

The First Opstina Court in Belgrade acquitted the accused S. B. The lad is always short of money, he borrows from his fellows at work, but he regularly returns it, and he has never had any dealings with the police or the courts. For 8 months now he has been employed in the same job where he was when the theft occurred. Never before had anything like that happened to him. In a very proper statement made before the court by S. T., the victim of the theft, he said that no one, not even S. B., knew that he was carrying that money (to buy some cement--if he happened to find it).

The accused S. B. has his locker next to the locker of S. T., the victim of the theft, and no conclusion whatsoever about the theft can be drawn from the fact that the victim of the theft happened to come upon him next to his locker. The other workers also had access to the shed. This is where they eat their lunch. Customers also come from time to time. In short, the court concluded that there were no indications that S. B. had committed the theft.

Nothing except his confession to the inspector in the police station. But "the confession of the accused that he took the money from the victim occurred as a consequence of behavior toward him in the preliminary proceedings," it was stated in the justification of the acquittal verdict.

This everyday story about a petty crime would hardly find room in this or any other newspaper if it did not illustrate, as if made to order, what Viobran Stanojevic, republic secretary for internal affairs of Serbia, said in the last issue of NIN: "There is no justification whatsoever for use of force outside the law and regulations.... As for forced confessions, even a voluntary confession is not proof in and of itself, and so much the less when it is made under pressure."

We would expect this inspector to reassess his methods of inquiry with the help of his superiors, and indeed all others who find it easier to obtain a confession than to ascertain the truth "on the spot" by tangible and painstaking work.

PRESS PROTESTS CHURCH ATTACKS ON ATHEISM

Zagreb VJESNIK in Serbo-Croatian 12 Sep 80 p 5

[Article by Nenad Ivankovic: "Atheism Is Not an Enemy of Religion"]

[Text] "Perhaps the time has finally come for us to cease to look at atheists as something hostile and alien to religion." This thought, stated by Tomislav Ivancic, professor of fundamental theology in Zagreb, actually sounds like an epigraph for the debate on the topic "Our Church Confronted by Atheism," which was recently held in Pazin as part of a pastoral course in theology.

Perhaps someone accustomed to the anathematization of atheism will be surprised that the theologians are not talking about it as either "brainwashing" or an ideology that is hostile to religion. Perhaps he would be surprised that they debated atheism "exclusively" as an epiphenomenon of religion--a phenomenon generated by religion itself, or, more precisely--religious feeling with no original source of its own.

Against Every Division of People

There would be no reason for surprise, since this is altogether in accord with the council constitution "Joy and Hope," which states among other things that atheism is not something which has its own source, but always rises up as a kind of antipode to piety itself and therefore cannot be spoken about outside the context of religious feeling.

Probably there are some who will not agree with this definition of atheism, but that is not essential here in the least. It is a more important fact that in taking this position the Second Vatican Council opened the doors to dialog and cooperation, condemning at the same time ideological confrontations between believers and atheists. After all, emphasizing these differences is not in line with the council's spirit, that is ecumenism, at all, about which, incidentally, Pope John Paul II wrote in his next encyclical ("Redemptor hominis"), among other things, "to equip us at the same time to come closer to all cultures, all ideological conceptions and all men of good will."

This idea, which is actually opposed to all division of people along religious, ethnic, cultural, ideological or other lines of commitment, is actually the moving spirit of a truly up-to-date church, just as "aggiornamento" is a measure of its accommodation to the world and a measure of its historical "purpose" in the world.

That is why K. Rahner's idea that the church "turn to atheists and serve them as people, support their efforts for the good of men and learn from their experiences and constructive effort for the good of man" is no exception at all, but the rule and indeed the categorical imperative of the church if it does not want to fall into self isolation.

A Part of Man's Dilemmas

That is why the participants in the Pazin course in pastoral theology were not even concerned with the phenomenology of all possible atheisms, no more than with their genesis, and still less with atheism as an ideology which has its representatives, toward whom one should then take a position, but they examined atheism as a part of man's dilemmas, questions and hopes.... "In that sense," Professor Antun Hek of Pazin said, "the dialog should be both to our own and to his enrichment." After all, as another theologist said in his turn (Dr Marijan Jurcevic, professor of religious anthropology in Rijeka): "The believer has discovered in the atheist a man with the same concerns, good intentions and failings. Likewise some atheists by conception or by belonging to some ideology or some party has discovered in the believer a man with the same concerns and the hopes. In practice, therefore, each recognizes the other as a man: life constitutes the greatest ecumenism and the greatest dialog."

The words of Father Jerko Valkovic of Crikvenica are evidence that this dialog is not some empty metaphor, much less some kind of theological crutch: "We in the church should pose the question of atheism and atheists even on behalf of the everyday concerns of life. Since we are here, since we were all born here, we have the same rights to this country, and we also have equal duties concerning its life. It is very important that we do not become entrenched in blocs and some sort of fronts. It is important that our history be our teacher, that we learn to respect one another, to honor one another, to discover good in one another and to value it."

No One's Special Privilege

These ideas, and this should be emphasized, are truly in opposition to the clericalistic attempts which are still made at times to dig a kind of ideological chasm between believers and atheists, to divide citizens into opposing camps on the basis of definitions which by their nature do not suffer any sociopolitical differentiation whatsoever. Since this society is not being built by atheists alone, nor by believers alone, since that is not anyone's special privilege, but is the duty and obligation of every citizen, it is clear where that kind of "entrenchment" leads. So if any

sort of differences are to be made, then it can be done only as to who has contributed how much to the development of this country and to the general good of all.

So religious feeling and irreligious feeling cannot be the grounds for any sort of differentiation which claims to have any sociopolitical relevance.

This is something that bears repetition so long as such attempts are made in practice. It is in this sense that we should see those talks about atheism at the Pazin conference on pastoral theology.

BRIEFS

OPSTINA PROSECUTOR ON TRIAL--On 22 September an indictment was made by the district public prosecutor in Mostar against Petar Barbir (29), public prosecutor of Ljubuski Opstina, for stealing and for misusing his official position. In the course of last year and this year until July he took 105,500 dinars and 3,850 West German marks, as well as 3,000 dinars in goods. According to the accusation, Barbir had demanded money from persons against whom criminal reports had been made offering them "guarantees" that they will have mild treatment in the course of criminal proceedings against them or that they would even be freed. Barbir received money from ten people, while five refused to give him money. [Text] [Sarajevo OSLOBODJENJE in Serbo-Croatian 23 Sep 80 p 20]

ENEMIES OF SELF-MANAGEMENT--At a 18 September meeting of delegates of the Presidium of the Federal Conference of the SAWPY, at which Istvan Rajcan, secretary of the Federal Conference, spoke, it was said: "We are conscious of the fact that individuals and small groups hostilely disposed toward socialist self-management want to exploit this occasion [the economic crisis] for their own ends. We can sometimes hear words about the fact that our system is incapable of overcoming the economic difficulties, that instability is the "product" of self-management, which is proclaimed to be economic anarchy. Representatives of dogmatic and etatistic concepts are openly recommenting stronger state intervention, an operative role for the LCY, and a system of centralist planning. The main tendency of these small groups is to sow disbelief in socialist self-management, to exaggerate our difficulties, and to sow doubt in the ability or preparedness of personnel in leadership functions. [Excerpt] [Zagreb VJESNIK in Serbo-Croatian 19 Sep 80 p 4]

CATHOLIC PAPER PRAISES STEPINAC--The 14 September 1980 issue of the Catholic twice-monthly publication GLAS KONCILA (page 10) publishes a report of the Zagreb Cathedral service held on 7 September commemorating the 50th anniversary of the ministry of Cardinal Seper. Archibishop Franjo Kuharic praised on this occasion also Cardinal Seper's former colleague in the priesthood, Alojsius Stepinac, saying among other things, "God led both of these men through the marvelous paths of sacrifice and witness. Both were given to us in a specific and difficult period of our history. In their calling as priest, archibishop, and cardinal they had to acquit themselves well not only in their personal lives but also on the level of history, namely, the history of the church and of the people." FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

PROPER SERVICING OF MILITARY EQUIPMENT STRESSED

Modern Weaponry Requirements

Sofia VOENNA TEKHNIKA in Bulgarian No 8, 1980 pp 2-3

[Article by Maj Gen Engineer Aleksandur Bozhilov]

[Text] "Modern technology formulates strict requirements pertaining to the intellectual and moral qualities of man." A. Berg.

Thanks to the increased economic and scientific and technical possibilities of our state, the fraternal aid of the Soviet Union and cooperation with the other socialist countries, the combat power of the BNA [Bulgarian People's Army] has a qualitatively new material and technical base.

The new complex armaments and combat materiel face army commanders and trainees with more complex and more responsible tasks and requirements. The operation of the new armament systems requires a specific approach. In this connection, this periodical has considered on a far more timely and frequent basis urgent problems of our daily life. For example, the article by Col Engineer Lukanski "A Feeling For the New and the Power of Inertia," published in issue No 11 for 1979, met with a broad response. The interesting problems related to the activities of army specialists and the views expressed by a number of authors give us reasons to consider and analyze our activities and those of subordinate specialists, draw proper conclusions, and earmark the activities needed for improving the style and method of work in order to upgrade our theoretical and practical training.

Modern armaments and equipment cannot be effectively used without high professional training. Today we cannot hope that omissions in the training and upbringing of the specialists will be eliminated as they use the equipment and armaments. This would be very costly. Here is an indicative example: A member of the crew of a combat vehicle forgot or, it may be more accurate to say, did not know that a certain valve had to be closed after practicing with the weaponry. This led to an outbreak of fire and the vehicle was immobilized for quite some time. Insufficient knowledge

of the weaponry leads to violations of safety regulations. Yet, contemporary weapons do not allow even the slightest deviation from the regulations governing its handling. Every commander and specialist must not only know what should and what should not be done in the various armament systems but have a proper concept of the consequences of his error or erroneous action. This, in turn, requires a profound mastery of all theoretical and practical operational fine points.

The time is long past when the approach to the armament was purely empirical, practical, while servicing it was reduced to the use of a screwdriver or a key. Modern weapons require a skilled scientific attitude. Only this would insure hitting the target with the first shot or the first missile. A specialist develops by steadily expanding his knowledge. Practical experience indicates that only knowledgeable and capable specialists can cope rapidly and easily with arising difficulties. A characteristic example in this respect is the case of officers Stefan Minkov and Borislav Todorov.

An alarm signal was issued by a unit. Its commander reported that a complex weapons system was not operating normally. The two specialist officers discovered that as the result of improper use the control of the system's mechanism was damaged. They not only repaired the damage but showed to the crew and the specialists in the unit how properly to operate the weaponry system. The unit commander sent a letter of gratitude for the help given. This is the type of specialists that are needed, combining control with specific practical help.

A profound knowledge of the structure and rules governing the use of armaments is the basis on which the skill needed for its combat use is acquired. We can count on success when the personnel are trained to handle armaments and combat equipment on a high technical level and when they have a feeling of duty and responsibility for the implementation of functional obligations.

We can see for ourselves that in recent years the nature of military work has changed. Today the specialists must display a scientific attitude toward their work and an intellectual approach. They must work with their minds, they must think. How topical are Engels's prophetic words that, "When the waves of the technical revolution are raging around us...fresher and more daring minds are necessary."

The military specialist faces a number of problems whose solution requires creativity and initiative, and the qualities of a good commander, organizer, and educator. In this connection, fulfilling Georgi Dimitrov's behest of "Let us learn day and night from the Soviet army," we could borrow a great deal from the Soviet military specialists and engineers. The sharing of the rich Soviet experience in the operation, maintenance, storage, and repair of armaments is a steady source of technical progress in the BNA. The artillery engineers and technicians must be the focal point of this progress.

The highly skilled specialists in our army are working to modernize armaments, insure the maximum satisfaction of modern requirements toward them, create original developments yielding major combat and economic results, improve repair technologies, and create material training facilities. An example in this respect is the unit where Officer Stoykov serves. Along with fulfilling the assignments on combat and political training of engineers and technicians, the unit uses the experience of Soviet specialists in areas such as, for example, the protection of armaments, combat equipment, and ZIP [spare parts, instruments and accessories]. Officers Botev, Todorov and Panchev are actively developing the automation and mechanization of loading and unloading operations and creating modern material and technical facilities. A number of rationalizations and inventions have been applied aimed at improving the use of armaments and upgrading their qualities.

The decisions of the National Party Conference call for the labor of the specialists to become highly organized, inventive and dedicated. It must become the work of creators with alert and restless minds, high quality and effectiveness. This demands that the engineers and technicians attentively follow the latest achievements in the military sciences and technology, including those of the capitalist countries. We must always remember Lenin's words. He considered it a crime "...the bahavior of an army which is not prepared to master all ways and means of struggle which the enemy possesses or could possess."

At the same time, we must make a precise and profound study of the possibilities of our own equipment and armaments in order to be able to use them most effectively in combat. We shall always remember Comrade T. Zhivkov's words: "The equipment must be mastered not in general but in such a way as to be used under the most complex conditions which could arise in a future war. Without this a modern army would be inconceivable. Our entire work--organizational and political--must obey this rule."

Regardless of the duty they perform, the engineers and technicians have been given the great honor of organizing the use, maintenance, safeguard, and repair of armaments and combat equipment. To this effect the specialists must creatively apply in their areas the latest scientific and technical achievements and modern methods of forecasting and upgrading the efficiency of armaments and equipment. They must seek means for the most economical use of each gram of material resources, drop of fuel or lubricant, or kilowatt hour of electric power.

We could boast of many successes. However, we cannot deny that, here and there, we find inertia, bureaucracy, obsolete work methods, and lack of creative thinking. This is what we must fight and respect cadres who do their work as a vocation and who love their profession. We must take as an example every officer who organically combines party-mindedness with profound competence, organization, discipline and creative approach to assignments. Modern equipment does not tolerate meaningless boastfulness

but demands daily creative and dedicated work for maintaining it in a state of constant good order and combat readiness.

The Commander, Seasonal Services

Sofia VOENNA TEKHNIKA in Bulgarian No 8, 1980 pp 9-10

[Article by Maj Gen Ivan Ivanov]

[Text] The internal regulations make it incumbent upon every commander to be familiar with the equipment assigned to his subunit and to periodically check its condition and availability. Instructions and other documents which regulate its utilization, operation, and storage are far more detailed.

As the regulations stipulate, the commander is the organizer of the entire life and activities in his unit. The most important and most characteristic feature of his daily activities is a concrete approach. Knowledge is necessary in order to be aware of current assignments and to properly realize problems. That is why today, more than ever before, the commander must be perfectly familiar with the equipment assigned to his unit and with the rules governing its use, operation, and storage.

The different kinds of reviews and services and their periodicity, extent, and deadlines for completing the stipulated operations depend on the type of the equipment and the conditions of its use and are defined in the respective manuals. Practical experience has indicated that the higher the quality of machine services is, and the better trained the personnel using them becomes, the more their breakdowns or irregularities decline and the higher the combat readiness and combat capability of the troops becomes. Usually, such activities are planned and are of a preventive nature. Seasonal technical servicing is the most important among them. This takes place twice annually. Its purpose is to make the state of the equipment consistent with the specific requirements and conditions of the season. The main performers are the drivers and the crews, actively assisted by the specialists. The work is organized by the technical services and guided by the commander.

Considerable positive experience has been acquired in the organization and implementation of seasonal maintenance work. It is reflected in the monthly plans and is considered one of the most important seasonal activities. In order to insure its organized and qualitative implementation, particular attention is paid to the preliminary preparations. The direct participation of the commander is the most characteristic feature of the organization and providing of seasonal servicing. This introduces better organization in the work, upgrades the discipline, and improves material and technical support. Furthermore, the personal example and closer control on the part of the commander mobilize the service personnel to insure the qualitative and precise implementation of assignments.

Our commanders have acquired great experience in organizing and carrying out seasonal technical servicing. Most of them are directing ever more personally preparations and servicing and personally participating in the work. Exemplary in this respect is Officer Kamburov. This year model practical exercises were carried out under his direct control along with overall material preparations. In the course of the servicing he checked the quality of the work and rated performances on a daily basis. Officer Kamburov is promoting the same work style among his subordinate commanders. As a result, the quality of servicing of the equipment is high and it is ready for use.

However, some commanders remove themselves from the fulfillment of this most important and responsible assignment. Some of them are merely present in the course of the servicing while others have entirely left this work to the officers from the technical services, the drivers, and the crews.

In the unit where Officer Petrenchev serves the equipment was not properly prepared for work under spring and summer conditions. The conducted study indicated that the leading and guiding role of the commander was absent in the course of the seasonal servicing. Unquestionably, this affected the organizing role of his subordinate commanders and, particularly, the results of the work.

As a stage in preparing the vehicles for work under special conditions covering a certain period of the year, seasonal servicing is one of the most important activities in maintaining the vehicles in high technical conditions. Past experience has indicated that wherever the equipment was serviced with insufficient preliminary preparations and where control and, particularly, command exactingness were not on the necessary level the quality of the work has been low and failures and breakdowns have been no exception. That is why all commanders must be concerned with the proper organization and qualitative implementation of seasonal services. The political organs and party and Komsomol organization must join most energetically in the solution of this most important topical problem.

Seasonal technical servicing is complex and expensive. That is why, together with the drivers and crews, the specialists from the technical workshops, who are in charge of the more complex operations, actively take part in it.

One of the most important prerequisites for the successful and qualitative seasonal maintenance is its preliminary preparations and material support.

In the period preceding the servicing, by order of the commander the time for the servicing, the procedure and the deadlines for preparatory activities are stipulated. To this effect, the ZKTCh [Deputy Commanders for Technical Affairs] draft detailed plans including all activities related to the preparations of the equipment, the work areas and their facilities, the repair and servicing facilities and, particularly, the

personnel. Particular attention is paid to material support. In this case the drafting of the proper documents and supplying of necessary servicing facilities and materials play an important role.

Rallies and training classes are organized for the personnel. Work groups are set up. Meetings are held and instructions on the socialist competition are issued. Control is organized and means for recording the work done are stipulated.

The main concern of every commander and the main obligation of the deputy commanders for technical affairs should be to supply everything that a workplace may need: technological charts, work benches with sets of tools, materials for general use, and others.

Seasonal servicing is not only a responsible but a rather difficult activity. The difficulties stem, above all, from the simultaneously resolved problems: Planning for the forthcoming period, holding rallies and command exercises, work on training-material facilities, economic and living problems, and so on. In this case the organizing work of the commander is particularly important. This is because he is not only best acquainted with the tasks to be implemented by the unit under his command at that time but because he handles the deployment of and maneuvering with the available forces and facilities in the course of the implementation of the task.

The preliminary preparations mark merely the beginning of the work. The most important condition for the successful implementation of the assignment remains the high organization of the work in the course of the execution and the steady aspiration to utilize and mobilize in full the forces of the entire personnel involved in the servicing. At the same time, permanent control and daily accountability of the work done play an important role in the timely completion. Such activities are organized and headed by the commander and directly under the control of the deputy commander for technical affairs.

There was a time when, for objective reasons or subjective considerations, many commanders removed themselves from the implementation of this exceptionally important assignment. Some of them were satisfied with receiving information on activities based on the current plans of the unit or the reports of their chiefs of services. This, however, is now past history. Today our commanders not only have solid military knowledge but good technical training as well. They are well familiar with the equipment of their subordinate units and the rules governing its use. Furthermore, with every passing year they become ever more familiar with the problems of the organization, implementation and reporting of the results of seasonal servicing, which are becoming an inseparable part of their daily command work. They penetrate the nature and content of problems related to maintaining the vehicles in a state of high technical readiness

ever more profoundly, displaying an understanding and high individual responsibility. All this becomes part of their daily work and their style and methods.

Armed with Marxist-Leninist theory, and implementing the decisions of the 11th BCP Congress, our commanders spare no efforts and forces to maintain the expensive combat equipment assigned to them in a state of full readiness. They are working with the clear awareness that this will insure the implementation of the tasks related to combat training and enhancing the combat readiness of their units.

Seasonal Servicing By Technical Workshops

Sofia VOENNA TEKHNIKA in Bulgarian No 8, 1980 pp 10-12

[Article by Col Nikola Gadzhev]

[Text] Preparing armaments and equipment for work under autumn and winter conditions is an important aspect of the work of commanders and technical organs. The qualitative organization and implementation of such activities largely determines both the solution of a number of problems related to the combat training of the troops and to maintaining a state of permanent combat readiness.

Along with the considerable amount of work which must be done by commanders and technical organs in preparing for and providing seasonal technical servicing, the extent of the direct and immediate participation of technical workshop specialists in various types of machinery is of decisive importance.

The question of using technical workshop specialists in seasonal technical maintenance make their high level training a mandatory prerequisite for the full and qualitative implementation of such obligations.

Previous experience has indicated that whenever the ZKTCh show a feeling of responsibility in the training of the specialists for seasonal technical servicing the results of their work become far better.

We are resolving the problem of training technical workshop specialists through a system of classes in accordance with organizational-methodical instructions as well as through two-day practical training immediately preceding the period of seasonal technical servicing.

What makes such training necessary? Practical experience has indicated that the need for it is dictated by the fact that the level of training of the specialists varies and that the quality with which various operations stipulated in the technical charts are performed by individuals in the same field of training may be different. Furthermore, there are stipulations not only in the manuals on the operation of a specific model but in

other documents and instructions which, one way or another, do not always reach the specialists. Practical experience has indicated that frequently the specialists fail to understand some specific problems arising in the course of seasonal technical servicing. For example, an error is made in regulating the braking system of ZIL-model vehicles by allowing for identical engine axles different strokes of the levers for actioning the diaphrams which results in the nonsimultaneous activating of the two axle wheels. In turn, this means that in applying the brakes the vehicle will lurch toward the side whose diaphragm is activated first, thus endangering the run of the vehicle. A similar situation exists in adjusting the clutch of ZIL-157 and ZIL-157-K vehicles, due to the fact that some specialists are unfamiliar with the features of the ZIL-157-K and leave a 20-30 mm play instead of 30-45 mm.

No less important in training the specialists is for the ZKTCh to determine their ability to use diagnostic equipment. This may be their weakest point, for they are either unfamiliar with many of the instruments or are not familiar with them enough. Unquestionably, this will affect the quality of the seasonal technical maintenance. Some ZKTCh believe that the diagnostic equipment should be used only in the diagnostic centers set up at technical workshops.

That is precisely why some specialists such as Master Sergeant Baykov, Sergeant N. F. Enev and others still have difficulties in using the instruments E-5 and K-301 in checking the electrical system of the vehicles.

What is our method in organizing the practical training of specialists for participation in seasonal technical servicing? When the technical service of the large unit formulates the technological charts, it determines which of the operations will be carried out by specific specialists. On this basis the chief of the workshop organizes practical training with the specialists who thus specialize in a specific work. It is mandatory for the specialists from the technical workshops of the units to attend such training, for usually each workshop has one or two specialists and the ZKTCh of the unit cannot organize the practical training of all of them at the same time. That is why we summon them to training provided at the technical workshop of the large unit under the guidance of the chiefs of sections in charge of repairs of the various machinery models and an officer from the big unit's service.

As we prepare the documents for the seasonal technical servicing we also draft a schedule for the use of the specialists broken down by days and vehicles. This makes their work more orderly and helps not only to upgrade the quality of the work but to resolve the problem of individual responsibility for work done on the machinery in the course of the seasonal technical servicing. We thus know what specialist has been working when and on what machine and what precisely he has done. Schedule violations always

lead to formalism in the work of the specialists and lowers the quality of the seasonal servicing.

At the same time, however, we pay great attention to equipping the workplaces and brigades with the necessary tools, instruments and appliances. This enables the specialist to carry out the operation, as indicated on the technological chart, on a high quality level. For example, it is virtually impossible to check the parameters of the stabilizer or the radio, tune up the vehicles or check the seals of a T-55 tank or a floating vehicle or the air cooling system of the tank unless the proper workplace or brigade has been equipped with the necessary tools, attachments and instruments. Consequently, the question of their availability is exceptionally important and no compromise solution is possible. For this reason the technical service of the big unit must establish a specific procedure for the utilization of instruments and attachments which could not be supplied to the individual workplaces or brigades of all units for simultaneous use. That is why we also draft a schedule for their use in different days by unit. This enables the ZKTCh of the units to properly plan the work of the specialists. This insures the rhythmical implementation of the entire amount of activities included in the technological charts of the different vehicles. The ability of the ZKTCh properly and most effectively to organize the use of technical workshop specialists is also necessitated by the fact that during the seasonal technical servicing some of the combat training, drill and transport vehicles also require repair operations which could consume a considerable amount of the specialists' time. For this reason, based on the list of repairs drawn up before the seasonal servicing, the ZKTCh must organize his work in such a way that repair operations will not eliminate the participation of the specialists in the seasonal servicing operations they must perform. In the opposite case their participation becomes fictitious which affects the quality of seasonal machine servicing.

A no less important aspect of our work in the course of the seasonal technical servicing is to organize and implement effective control by the ZKTCh of the individual units and the officers of the technical service of the large unit regarding the quality of the work done by the technical workshop specialists. The question of quality control is of great importance in terms of end results in making the equipment fit for work in autumn and winter conditions. In order for the ZKTCh to insure effective control, mandatory knowledge is required not only of the adjustment parameters of a given system or unit but the ability of the ZKTCh to use control facilities as well. That is precisely why we hold a one-day meeting with the ZKTCh to acquaint them with new or insufficiently well-known control instruments. For example, it would be difficult to guide and control work on the processing of a tank engine for storage with the help of the AKD-1 unit unless the ZKTCh of companies and battalions are thoroughly familiar with it. This is precisely the reason for which there have been frequent cases of some subunits to process a tank engine

for storage in accordance with obsolete methods. Another similar problem is that of familiarity with the remaining machine units and instruments for controlling the condition of the vehicles and of instruments needed for one or another operation as required by the technological chart of a given vehicle model.

All this proves that organizing the work of the technical workshop specialists during the seasonal technical servicing is no easy matter and that it should be approached with the highest possible feeling of responsibility. Practical experience has indicated that whenever the ZKTCh and the technical service have paid serious attention to the training and use of technical workshop specialists for seasonal technical servicing the results of their work and their individual contributions to high quality preparations of armored vehicles for work under seasonal conditions are considerably higher. This contributes to maintaining armored vehicles in a high state of combat readiness and insures normal conditions for high quality training.

Preparing Tanks for Winter Work

Sofia VOENNA TEKHNIKA in Bulgarian No 8, 1980 pp 12-13

[Article by Maj Engineer Georgi Boyadzhiev]

[Text] Two-day training classes with the participating personnel are held immediately before the seasonal technical servicing (STO). The study covers the features of operating tanks in autumn and winter conditions, the amount of activities to be carried out and the safety measures to be taken in their implementation, after which practical instructions are given on the most complex operations. In order to achieve high quality STO, commanders, ZKTCh and technical workshop specialists draw up specific lists of defective equipment. A route technological chart must be provided for each vehicle in order to increase responsibility for the fulfillment of the operations stipulated in the technological charts. The route technological chart must stipulate the member of the brigade (post, crew) performing a specific operation. After the servicing, the route technological charts are submitted by the chief of the brigade or post to the ZKTCh of the subunit and are kept until the next STO.

As the vehicles are used, the quality of the lubricant in the moving parts worsens, seals are broken as the result of wear and tear, and bearings are damaged. This calls for dismantling the running parts of all combat training vehicles and of combat vehicles which have been run across water in the summer and, on a preventive basis, once every 6 years, of 20 percent of the battle tanks. Experience has indicated that after such dismantling old and unfit seals have been used or that some of the new seals have been damaged in assembling the bogies. The quality of the seals may be checked by winding up the pressure roller after the rollers

have been assembled, in the area of the upper lubrication plug, and of the air pump pipe of the lower plug, thus creating a pressure of 0.5 MPa (5 kg per square centimeter), which must last 2 to 3 minutes. The labyrinth ring must be checked. Should there be a lubricant leak from it the defective seal must be replaced. This guarantees the protection of the roller bearers from mud and water. The low winter temperature requires the use of antifreeze instead of water. If necessary, the cooling systems must be flushed in advance with a six percent solution of lactic acid heated to 80°C. We must bear in mind that the acid has an adverse effect on rubber seals and that such flushing takes place only if it is truly necessary, i.e., in the presence of boiler scale. After draining the water solution of lactic acid, the cooling system must be flushed with soft water. Following the draining of the water the cooling system must be air blown. The volume of antifreeze must be five to six liters under the capacity of the system. This is necessitated by the higher expansion coefficient of the antifreeze. Should the radiator be filled up, following the heating of the antifreeze to the level of engine running temperature, some of the liquid will be released by the system. In order to be confident that the cooling system is in order it must be checked for leaks. A tap with a pressure gauge and an air pumping valve must be put at the place of the air-steam valve. A pressure of 0.11 MPa (1.1 kg per square centimeter) must be created. For a period of 10 minutes the pressure must not drop by over 0.02 MPa (0.2 kg per square centimeter). Should the pressure drop the leak must be found and sealed. The preheater valves of the combat training vehicles must be opened. In the summer the nozzles of the preheaters are kept in storage, for which reason they must be washed together with their fan screens and the preheater flame must be adjusted to insure their normal operation in winter. The fire pipe boiler must be cleaned by removing and scrubbing it with a wire brush and tractor kerosene.

In order for the engines to operate normally the air filters must be washed. The boxes are washed in diesel fuel at a temperature not below 15°C. They must be drained after washing and lubricated with MT-16p oil in their upper and middle sections, in dust-proof enclosed premises. After oiling, the sections must be placed at a 45-60 degree angle in order to drain. The draining time is based on the temperature of the oil. At temperatures of 100, 80 and 60 degrees centigrade, it is, respectively, 30, 90, and 120 minutes.

The cyclone dust separator must be rinsed with diesel fuel and dried with compressed air. Even though the oil from the sections has been drained, some of it remains within the frame and, after reassembling, drains into the cyclone separator, oiling the cyclones from within, after which dust settles on the oiled surface and the air filtering is worsened. In order to eliminate this unnecessary oil, immediately after the casings have been put back, the air filter must be assembled and placed in the tank, the engine must be started and ran for 3 to 5 minutes at 1,400-1,800

revolutions per minute, in the course of which the air flow tears off the small oil particles and carries them to the cylinders.

The penetration of water inside the slotted guide plate dirties its selector rods, as a result of which the gears in the gearbox cannot be engaged. This requires the disassembling of the unit and its cleaning, and the lubrication of the selector rods.

In order for a normal temperature system to be maintained, the state of the louvers and their control gears must be checked, defects eliminated, and hinge joints of drives lubricated.

In the winter the viscosity of the electrolite in the batteries rises and its penetration into the pores of the active mass is hindered. This worsens the work of the electric starters. Furthermore, we must not forget that the lesser the thickness of the electrolite the higher its freezing temperature is. For these reasons the batteries must be kept in a state of delution not exceeding 25 percent.

The water which finds its way in the fuel lines and filters freezes. Ice caps are formed and the engine stops or cannot be started. That is why the filters must be checked and five to six liters of fuel must be drained from the tanks and checked for water content and filtered, after which the fuel lines are recharged.

The air bottles must contain compressed air under pressure of 13.5 MPa (135 kg per square centimeter). It must be borne in mind that in some tank models the upper bottle must be loaded to 7 MPa (70 kg per square centimeter) and that if kept stationary, this air pressure level must not be exceeded so that the safety valve of the air reductor IL 611-150-70 does not break down. Furthermore, the seal of the system must be checked, leaks must be eliminated, and the condensor must be released from the moisture and oil separators, paying particular attention to the one next to the air bottles.

These are the most essential activities whose proper execution is a basis for the reliable operation of tanks in the autumn and winter training period.

BETTER TRAINING IN USE OF NEW WEAPON SYSTEMS ADVOCATED

Sofia VOENNA TEKHNIKA in Bulgarian No 8, 1980 pp 14-15

[Article by Capt Engineer Kiril Shakrachki: Our Experience in Organizing and Holding a Vehicle Fleet Day"]

[Text] The vehicle fleet day is one of the most important activities in maintaining the equipment and armaments in proper technical order and permanent combat readiness. Furthermore, in the course of the day the proper attention is paid to checking and improving fire fighting and training-material facilities and the landscaping of the grounds.

In order for vehicle fleet day to be highly effective a good organization of the work and preliminary preparations are needed and improved steadily.

We plan, organize, and hold vehicle fleet days in the following order:

At the end of the current month, as we draft the plan, we also plan the vehicle fleet days to be held in the next month, coordinated with other activities and tasks. It training classes or comprehensive exercises are held in a given week, ending on a Friday or Saturday, in addition to the vehicle fleet day we allocate yet another day for servicing the equipment.

In the course of a conference with the commanding officer, we earmark the main activities to be carried out on maintaining the equipment and armaments during the following month. We then draw up a plan for vehicle fleet days to be held during the month.

The preparation for the next vehicle fleet day begins with the drafting of its plan which must be approved by the commander by Wednesday at the latest and a copy of which is distributed among the subunits. The plan calls for the solution of problems which are part of the basic activities related to the equipment for that particular month, but already broken down into details. The main officials of the staff who will help the subunits and check the equipment in accordance with the service regulations and instructions are named.

On Thursday, in the course of the conference on reporting and planning the weekly cycle of the following week, the commander also formulates the tasks for vehicle fleet day, assigning to the staff officers the various control assignments or the subunits to be helped. He instructs subunit commanders on the salient points to which attention is to be paid and the number of men to be assigned to general work. The subunit commanders as well draw up their vehicle fleet day on Thursday. On this basis, on Friday the chiefs of stations and the drivers draw up their individual plan-assignments. The instructors who will be teaching specific topics to be covered at the beginning of the vehicle fleet day also draw up their plans at the same time. Friday afternoon the necessary materials are given to the subunits for servicing the equipment along with instruments for work on the territory of the depot.

Vehicle fleet day begins with a general review in the course of which the readiness of the personnel for work is checked. The commander then announces the time breakdown and the assignment of staff officers by subunit. After that the subunit commanders specify the assignments and go over the basic safety requirements and the procedure to be followed in checking the company equipment. The ZKTCh [Deputy Commanders for Technical Affairs] give further specifications on the posts and the technical personnel who will be assisting the subunits after which the troops march in military formation to their work areas and cites. Here, headed by their commanders and the deputy commanders for technical affairs, in about 30 minutes the drivers and specialists go over the practical questions which will help the personnel to do the technical servicing competently and on a high quality basis. Thus, for example, in one of the vehicle fleet days the following items were covered with the drivers: types of oils and their use in a motor vehicle; lubrication areas; preparing the automotive vehicles for emergency driving under winter conditions. The following items were covered with the signalmen: rules for operating radio transmitters under winter conditions; types of antennas and procedures governing their use; and safety measures in handling equipment issues.

Having gone over the training questions, the personnel began work in accordance with the plan-assignments. The drivers were working with the motor vehicles while the crews carried out regulation operations involving communications equipment. Usually, the drivers are issued several permanent assignments. For example, every vehicle fleet day they must check the oil in the engines and the position and condition of the batteries. On the one hand, this is important in maintaining the equipment in constant combat readiness and, on the other, it enables the personnel to take measures to prevent breakdowns.

In the course of the vehicle fleet day platoon and company commanders review the proper documentation and technical conditions of the motor vehicles and communications facilities. They direct the work personally and see to it that the equipment is serviced on time and properly.

Every month we go over regulation No 3 concerning communications equipment involving the use of the measurement issues and done by the crews. Since this involves a high amount of work, regulation No 3 is covered over two to three fleet vehicle days. To this effect the ZKTCh of subunits plan in advance the operations to be carried out in a given fleet day. This way, in the course of the month, the entire equipment stipulated in regulation No 3 is covered.

We find it more difficult to deal with measuring the parameters included in regulation No 3. The parameters of systems for which measuring equipment is available are measured in advance according to schedule. This is done by the technical organs of the workshops under the guidance of the subunit engineer. Therefore, during the vehicle fleet day the crews concentrate on the stations and the instrument systems. The complexity of the work is caused by the fact that our instruments systems do not have the full set of measuring equipment. Some of the crews are unable to perform the operations as stipulated in the regulations. That is why we have prepared rolls of technological diagrams and regulation operations for each station (set of instruments). The specialists were given several hours of training. This insured the better quality of regulation work done by the personnel and, hence, the maintenance of the equipment in constant technical fitness and combat readiness.

The help which specialists from the signals and motor workshops give the subunits plays an important role in the conduct of proper operations during vehicle fleet da, and in upgrading its effectiveness. Usually we organize several mobile centers which provide effective aid at the site. Thus, for example, all batteries are checked by brigades consisting of the chief of the charging station and two privates.

The tuning of all motor vehicles is checked and brought up to norm also on the site by a brigade consisting of a mechanic and the subunit drivers. Before the work starts subunit commanders are informed of the technicians and assemblymen who will be assigned to them on fleet vehicle day.

Furthermore, the workshops set up self-servicing centers equipped with the necessary tools and materials for minor repairs of motor vehicles, stations, instruments, and other signals equipment.

During vehicle fleet day we also set up a brigade to check and adjust all the electrical machinery, consisting of one technician and one driver. They check all units and eliminate minor defects. Thus, at the end of the day we have precise information on the condition of the communications and automotive equipment. This enables us to give specific assignments to the workshop personnel on the elimination of discovered malfunctions in the course of the week.

Our vehicle grounds have loudspeakers. This enables us, in the course of vehicle fleet day, to broadcast in honor of troops and commanders with best achievements in the maintenance and operation of the equipment. Usually this takes place during the rest period, from 1000 to 1030 hours. We organize suitable radio information for each vehicle fleet day. This lifts the spirit of the personnel and helps to improve labor effectiveness.

The vehicle fleet day ends with a short review by the commander who begins by hearing the reports of control staff officers. He then rates the subunits, issues citations, and gives the assignments for the following vehicle fleet day.

DIRECTIVE ON RESTRUCTURING MILITARY ACADEMIES PUBLISHED

Prague SBIRKA ZAKONU in Czech No 95, 8 Aug 80 pp 427-430

[Proclamation of the Federal Ministry of National Defense of 16 July 1980 which promulgates the 15 July 1980 order of the President of the Czechoslovak Socialist Republic on implementation of Law No 39/1980 of the Collection [of laws] concerning higher schools for higher military schools--signed by Col Gen Eng Rusov, First Deputy Minister of National Defense]

[Text] The Federal Ministry of National Defense is promulgating the 15 July 1980 order of the President of the Czechoslovak Socialist Republic on implementation of Para 86, articles a) and b) of Law No 39/1980 of the Collection concerning higher schools for higher military schools.

Higher military schools are an inseparable part of the Czechoslovak educational system and the highest level of the military school system. They carry out important tasks in building up the Czechoslovak People's Army and increasing its combat and political preparedness.

The demanding tasks of creating a developed socialist society and ensuring its defense place high demands on the preparedness of the military cadre and thus also on the activities of the higher military schools.

The role of the higher military schools is in particular:

a) in accordance with the military policies of the Czechoslovak Communist Party and the patriotic and international mission of the Czechoslovak People's Army within the union of the armies of the Warsaw Pact and in keeping with the goals of communist education and the latest knowledge of science, technology, and the military arts to train ideologically staunch and morally mature graduates, educated both politically and in their skills, to take demanding positions in the Czechoslovak People's Army, and

b) to develop educational training work and scientific, research, and development activities and thus to contribute to the development of science and technology in accordance with the needs of the Czechoslovak People's Army.

Paragraph 1

Higher Military Schools and Faculties

In accordance with Para 86, Article a) of Law No 39/1980 of the Collection concerning higher schools (hereafter just "the law"), it is laid down that:

(1) The higher military schools of the university nature are:

a) The Klement Gottwald Military Political Academy in Bratislava, with faculties for:

--postgraduate training of military-political faculty,

--higher school training of military-political faculty.

Graduates will complete their studies in accordance with Para 43 of the law by taking the state final examination. In connection with completing their studies, they can take the state specialization examination. After completion of the state specialization examination, the higher school will award them the title "Doctor of Social Political Science" (abbreviated "RSDr") in accordance with Para 44, Section 2, Article f) of the law. The higher school can also award the title without taking the state specialization examination in accordance with Para 44, Section 3 of the law.

b) The Military Medical Research and Education Institute Jan Evangelista Purkyne in Hradec Kralove.

Graduates of the study fields of general medicine and stomatology complete their studies by taking the state specialization examination in accordance with Para 42, Section 1 of the law. In accordance with Para 42, Section 2 of the law the higher school will award them the title of "Doctor of Medicine? (abbreviated "MUDr").

Graduates of the study field of general pharmacy complete their studies by taking the state final examination in accordance with Para 43 of the law. In connection with completion of their studies they can take the state specialization examination. After completion of the state specialization examination the higher school will award them the title of "Doctor of Pharmacy" (abbreviated "PharmDr") in accordance with Para 44, Section 2, Article e) of the law. The higher school can also award the title without taking the state specialization examination in accordance with Para 44, Section 3 of the law.

(2) The higher military schools of a technical orientation are:

a) The Antonin Zapotocky Military Academy in Brno, with faculties of:

--the postgraduate training faculty for combined arms, and branches of arms and services,

--the military-engineering faculty,

--the foreign faculty.

The postgraduate training faculty for combined arms and branches of arms and services also offers postgraduate education of an economic orientation in the organizational-economic study fields.

b) The Higher Military School of the Ground Forces named for thrice-Hero of the CSSR and Hero of the USSR Army General Ludvik Svoboda in Vysoka Morava with faculties of:

--the combined arms faculty,

--the faculty of branches of arms.

c) The Higher Military Aviation School of the Slovak National Uprising in Kosice, with faculties of:

--the command-engineering faculty,

--the military engineering faculty.

d) The Higher Military Technical School of Czechoslovak-Soviet Friendship in Liptovske Mikulas, with faculties of:

--faculty of antiaircraft equipment for air defense of the state,

--faculty of radar and automated command systems,

--faculty of air defense of the ground forces,

--communications faculty.

e) Military faculty of the Higher School of Transportation and Communications in Zilin.

(3) The higher military school of an economic orientation is:

The Higher Military School of Rear Services and Technical Support named for Hero of the CSSR Jan Sverma in Zilin.

(4) Graduates of the higher military schools of technical and economic orientations complete their studies by taking the state final examinations in accordance with Para 41, Section 1 of the law. The higher schools award them the title of "Engineer" (abbreviated "Eng") in accordance with Para 41, Section 2 of the law.

Paragraph 2

Study Fields and Length of Studies

In accordance with Para 86, Article b) of the law, the appendix sets out the study fields and the length of regular studies for the individual study fields in the higher military schools.

Paragraph 3

The following are rescinded:

1. Proclamation of the minister of national defense No 90/1966 of the Collection which publishes an extract from the Order of the President of the Republic on implementing Law No 19/1966 of the Collection concerning higher schools in the area of higher military schools.

2. Proclamation of the Federal Ministry of National Defense No 16/1973 of the Collection on changes in the organization of higher military schools.

3. Proclamation of the Federal Ministry of National Defense No 133/1979 of the Collection on changes in the organization of higher military schools.

4. Order of the minister of national defense No 16 of 12 September 1966 on implementation of the Order of the President of the Republic on 9 September 1966 "Provisions for Implementation of Law No 19/1966 of the Collection Concerning Higher Schools in the Area of Higher Military Schools," file portion 39/1966 of the Collection.

5. Directive of the Ministry of National Defense for strict examinations at the Klement Gottwald Military Political Academy (specialization program), file portion 26/1967 of the Collection.

6. Directive of the Ministry of National Defense for awarding titles to the graduates of the Klement Gottwald Military Political Academy who completed studies prior to the effective date of Law No 19/1966 of the Collection concerning higher schools and Order of the President of the Republic No 15/1966, file portion 26/1967 of the Collection.

7. Report of the Ministry of Education and Culture and the Ministry of National Defense on higher military schools, portion 38/1961 of the U.l. [Constitutional Decree].

Paragraph 4

This proclamation takes effect 1 September 1980.

[Signed] First Deputy Minister Col Gen Eng Rusov

Attachment to Paragraph 2 of Proclamation No 95/1980 of the Collection

System of Study Fields and Length of Regular Studies at Higher Military Schools

Numerical Designator[1]	Main Group Study Group Field of Study	Length of regular studies (in years) Full time	Part time	Orientation of studies at higher military schools (or faculties)

WEST GERMAN REVIEWS OF GDR'S TWO NATION-TWO LANGUAGE PROBLEM

Linguistic Consequences of National Division

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 10 May 80 'Bilder und Zeiten' supplement p 4

[Article by Horst Dieter Schlosser: "Is There Still a German National Language? Linguistic Agreements and Controversies." Translations of writings by below-cited GDR scholars are published under the quoted headings in the following JPRS issues of this series: by Prof Guenter Feudel,"Research Developments in Marxist-Leninist Linguistics," 68736, 7 Mar 77, No 1361, pp 13-20; and "Joint GDR-Soviet Linguistic Research Discussed," 65924, 14 Oct 75, No 1146, pp 1-3; by Gotthard Lerchner, included in "'Abgrenzung,' National Language Problem Still in Focus," 67657, 27 Jul 76, No 1273, pp 5-23. For a comparison of official GDR and FRG dictionaries, referred to below, see JPRS 70803, 20 Mar 78, No 1514 of this series, pp 62-69. For a West German review of the GDR's revised Philosophical Dictionary see JPRS 64368, 20 Mar 75, No 1048 of this series, pp 90-92. Translations of other related information are available in JPRS issues of this series as follows: on importance of ideology in linguistic research, 64957, 10 Jun 75, pp 42-53; and on further joint GDR-East bloc language research, 68288, 30 Nov 76, pp 1-5]

[Text] Thirty years after the establishment of the Federal Republic and the German Democratic Republic respectively it seems appropriate to carry out another study to see whether and what linguistic consequences have been provoked by the division of Germany into two states. Such an inquiry is encouraged not least by the increasingly clamorous GDR assertion that, in the meantime, not only has the German nation ceased to exist but also standard German as a common national language. Should the first assumption be in fact correct, the second would no longer seem quite so preposterous.

GDR linguists pronouncing on the topic may well refer to West German analyses in the 1950's and 1960's, which already drew attention to the linguistic consequences of the division of Germany and fed the fear that the community of the German language might one day be lost altogether. In 1977, at the Twelfth International Linguistic Congress in Vienna, Guenter Feudel of the

East Berlin Academy of Sciences addressed this important international audience. He exploited somber early West German forecasts for his own purposes though admitting that the earlier analyses had been somehow suppressed, and that FRG linguists were now taking a "revisionist" line, pleading for the "unifying tie of the German language."

As far back as 1976 linguist Gotthard Lerchner (Halle) noted in the FDJ newspaper FORUM that it was no longer appropriate to speak of the unifying power of the German language. Instead the German language in the Federal Republic and the GDR had split in at least two different "national linguistic variants." In Vienna Feudel repeated this assertion and, though not explicitly, forecast a future in which Federal Germans and GDR citizens would each have their own national languages. We are bound instinctively to recall such historical developments as the departure of Dutch from the German linguistic community.

Neither Lerchner nor Feudel quote sources for the recent West German attitude alleged to play down the linguistic differences between the Federal Republic and the GDR. Actually such sources are hardly to be found because analyses continue to be published and noted in the Federal Republic regarding the progress of the linguistic divergence of the two German states. A comparison of official dictionaries such as the Leipzig and the Mannheim "Duden" quickly--possibly rather too quickly--provides the evidence.

Years ago Soviet linguist M.M. Guchmann provided GDR linguists with a Marxist concept of the "German national language," although they seem not quite able to handle its range--from the sociohistoric justification to the linguistic description of a standardized written or "high" German. In 1964 Guenter Feudel himself translated Guchmann's book "The Approach to a German National Language," and he is therefore the person most likely to correctly relate these two theoretical poles. Most of all is it to be expected that he remembers the necessity for relating the term "national language" to the historical consciousness of a German nation at the time our literary language evolved--if he is not to be bogged down in all the modern contractions of the concept of the nation. Once the politicization of this concept in the 19th and 20th Centuries is made to provide the basis of consideration, any separate political development in the old Reich (to 1806) must needs appear like the dissolution of a national unity. Yet, for the longest time in the German past the national unity of Germany was "merely" a cultural and, therefore, largely linguistic unity. Despite its special dialect nobody in Austria has ever raised the issue of linguistic community with Germany as blatantly as the GDR linguists; not even the Swiss have done so, although quite evidently German literary language has begun to be supplanted by Schwyzerduetsch, for instance in the news media. And all that despite the fact that in these two instances the national "Abgrenzung" [delimitation, separation] is quite indisputable.

Consequently GDR linguists such as Feudel must grossly misjudge the historic possibilities and limits of the concept of a German national language if

they credit with the greatest explosive force the latest of the special political developments of the German nation.

What are the real facts regarding the coincidence, misinterpreted by Lerchner and Feudel--for whatever reasons--, of some of their arguments and Federal German analyses of actual linguistic separation in East and West? By now earlier fears of a distinct "russification" of the language in the GDR should be stilled, because many of the scientific and technical developments of Anglo-Saxon origin have been linguistically adopted (admittedly quite often via the Soviet Union). Uwe Johnson's early novel "Mutmassungen Ueber Jakob" [Conjectures About Jacob], for example, which at the time conveyed to the public in the Federal Republic the most detailed information about everyday life in the GDR, has familiarized us with Anglo-American technical terms which are used more freely in the GDR than in the Federal Republic. A good example is "dispatcher," a responsible employee who must constantly inform himself about the progress of work in hand and, if need be, reorganize enterprise operations for the purpose of plan fulfillment.

So far GDR arguments have not assigned the "russification" of the German language the same importance for the proof of linguistic separation as did studies on this side. On the other hand it would be equally misguided to read more into the adoption of Anglo-Saxon or French linguistic elements than the fact that the German language in general tends to be open to the influence of foreign tongues (despite all efforts--even more pronounced in the GDR than here--to keep the language pure). In fact, in the sphere of science and technology such an influence is well-nigh inevitable.

It is here, though, that GDR arguments go off on another tangent. They claim that the German language of the GDR differs from that of the Federal Republic especially by greater emphasis on a sociopolitical and technical vocabulary, thus reflecting social progress. This thesis, though, still lacks any empirical proof. The so-called evidence quoted over and over again initially signifies nothing but an aspect of language, which proliferates in all modern communication communities: Technical jargon. Now we must admit that this is very prominent in the public language of the GDR, in particular the mass media, and represents a real difference by comparison to the Federal Republic. GDR newspaper and radio reports use a highly developed technical language to a far greater extent than the corresponding publications of our media.

Whether this is realistic or not, public linguistic usage in the GDR assumes a citizen well versed in science, technology and economics. After all, official political and cultural educational targets over there decide public linguistic usage far more directly than they do in the Federal Republic. At the same time the empirical material available is by no means sufficient for us to be sure whether this implies longer-term consequences for non-public linguistic usage, in other words for the private sector of family and friends. Some observations of everyday speech in the GDR indeed show few traces of such consequences.

The history of language has so far shown that cultural advances usually enter common usage to a very limited extent only (in the West as well as in the East we still speak of the sun rising and setting, not--as would be scientifically accurate--of the earth going through these motions!). Short-lived phenomena, such as technical innovations which are quickly superseded by further improvements and new discoveries, have no more than a slight chance of being permanently included in the vocabulary of an entire linguistic community.

Particularly dubious in this connection is the efficacy of the acronyms popular in the public language of the GDR (such as LPG for agricultural production cooperative, NVA for National People's Army, and so on), albeit GDR analyses constantly cite these as a feature of linguistic separation. Despite printing an extensive register of acronyms, the 1970 Leipzig "Duden" warned in rule 196: "We should not allow a kind of 'Akuesprache' (language of abbreviations) to take over. The oft cited 'time saving' is acquired at undue cost if it results in the maiming, impoverishment and frequent unintelligibility of the language." In fact it is now far more usual than one might assume to see the semi-official acronym "GDR" replaced in GDR written and oral media texts not only by the full title "German Democratic Republic" but also by such terms as "the republic" or "our republic" (just as it is increasingly considered chic here to speak of "this republic"--meaning the Federal Republic).

It would be intriguing to investigate how many of the political and cultural achievements of the GDR, much touted at the time of their introduction in official communications, have by now been dropped linguistically and factually. Already omitted in the 1970 "Eastern Duden" were such terms as "Selbstlauf" [self-sustaining], self-sustainment theory, the "Neubauer" [new farmer], the Hennecke shift or movement (though the Soviet model for quota overage work, the Stakhanovite movement, was still listed). Other dropped acronyms were AuB (for combinations with "worker and peasant") and MAS [agricultural machinery leasing station].

We have here a perfectly normal amendment process which is not restricted to the GDR but should actually be barred there because the official doctrine insists that the increasing penetration of the spoken and written language by "scientific terminology of working class revolutionary ideology" (Feudel) is more important than short-term and changeable outside influences on linguistic usage.

We do have some evidence, though, of linguistic "conservatism" in the GDR also, unless checked constantly and word by word for ideological conformity. An excellent example is a commentary in the East Berlin BZ AM ABEND, written by Karl-Eduard von Schnitzler who--as a matter of course--used the word "Abfallprodukte" [waste products], though the currently topical term used by GDR technocrats is "Abprodukte." In the same commentary Schnitzler even committed what amounts to a cardinal sin against the command--issued by hypercritical spirits in the GDR--always linguistically to indicate the responsible person when giving any kind of political information: He wrote that "World War II began on 1 September 1939."

The GDR media supply many other proofs of the relative immunity of the common linguistic system. We may therefore assume that even in the distant future Germans from East and West will manage to communicate without an interpreter. It is indeed almost touching to observe the strenuous search for some change in the linguistic system. Feudel cannot help but admit that developments in the Federal Republic and the GDR display "many similar trends." At the same time he forecasts that developments "might (!) generally proceed rather differently in the FRG than in the GDR."

It is far more likely that the common language will continue to live not as an irrelevant communication shell but as a unified linguistic system, independent of the different political roles assigned it in different states and even by different groups and individual users of the language. It will manage to do that which the German spoken or written language did long before the constructions of the concept of the nation in the 19th and 20th Centuries, precisely on the basis of its linguistic standardization: The immediate mutual understanding between those who speak the same language, if need be also the conduct of serious controversies such as were carried on at an early stage of the newly established standard language between Luther and his orthodox or radical-reformist opponents, and by all later polemics in the medium of the one German language. Its ability to serve this purpose at the present time also is best demonstrated by the successful 1975 request of the German speaking members of the United Nations for important U.N.documents to be translated into German (and that in common for the Federal Republic, the GDR, Austria and Switzerland).

Evidence of a continuing common national language is not a suitable means for political ingathering. However, we must say that the political situation between the two German states, especially the GDR's delimitation successes in other spheres, is by now so unequivocal that no additional trenches are needed to disperse the danger of a warlike change in the existing conditions. Evidently such additional trenches may be dug in the field of our language only by strenuous efforts and to the accompaniment of theoretical breaches. So far history has not yielded any proof that any community, especially a common language, ever disrupted "peaceful coexistence." On the other hand such disruption may well follow if one party insists on having its undisputedly independent characteristics in one field acknowledged in all possible and impossible other spheres. That, however, is not a linguistic but a psychological problem.

SED Vacillation on 'National Question'

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 15 Apr 80 p 11

[Article by Dr Jens Hacker, Cologne: "'On the Whole the Same Ethnic Characteristics'--The National Dilemma of the GDR." A translation of the below-cited Sep-Oct 1979 East Berlin EINHEIT article by Professors Alfred Kosing and Walter Schmidt is published under the heading, "Nation Versus Nationality Concept Analyzed," in JPRS 74590, 16 Nov 79, No 1738 of this series,

pp 44-53, with references to further writings on the subject by these two German scholars. For earlier West German analyses of this GDR problem see JPRS 74674, 29 Nov 79 of this series, pp 23-31]

[Text] The SED leaders spared no propaganda efforts to prepare the 30th anniversary of the GDR's establishment on 7 October 1979. At that time they lent the greatest possible emphasis to the statement that the concepts of "nation" and "fatherland" had acquired a new substance imprinted by socialism. It was to be considered one of the most important future needs to develop and strengthen "socialist German national consciousness" and "socialist patriotism" in the GDR. Proclaiming also the doctrine of the "adjustment of the socialist nations," East Berlin further sought to provide the "national issue" with prospects pointing far into the future. The national doctrines and slogans of the SED have recently been accompanied by a more emphatic attempt to link to them the issue of the nature and role of the fatherland in socialism. All of this is specially designed to distinguish the GDR as much as possible from the Federal Republic of Germany, although the GDR leaders are still not able to appeal to a national GDR consciousness.

By pushing national delimitation East Berlin also intends to counter two central tenets of Bonn's Germany policy, on which all parties represented in the Bundestag are agreed: Even after the conclusion of the basic inner-German treaty the "German question" remains open, both legally and politically, and the unity of the nation persists. In the Federal Republic far too little attention was given the fact that the SED leaders used precisely the 30th anniversary of the GDR's establishment to revise their long-standing and emphatic policy of national division and concede to the Germans residing in the Federal Republic of Germany at least the attribute "German nationality." The uncomfortable shifting of attitudes by the East Berlin party and government leaders since 1969 must still be attributed to the legacy of Walter Ulbricht.

In the period from 1949 to the end of 1960 neither politics nor science in the GDR left the slightest doubt of the continued existence of an undivided German nation. Addressing his party's Central Committee on 15 December 1960 SED chief Walter Ulbricht first proclaimed a certain--though not fundamental --change. He said that the "Bonn politicians, as lately noted by their official philosopher Jaspers, expected two states to continue for a long time to come." "In fact Herr Jaspers talks of the emergence of two German nations. We consider...this outlook wrong...Wherever a modern nation has arisen, the restoration of the unity of the nation has been historically inevitable, despite temporary division." From 1962 on the SED claimed (for example in the "national document" enacted on 17 June 1962, 10 months after the construction of the Berlin Wall, by the National Congress of the National Front "that the West German imperialists aided by the Western powers...have shattered the unity of the nation." By contrast, in its first program of January 1963, the SED claimed to represent "the real interests of the entire nation."

In subsequent years also the doctrine was maintained that there was only one, albeit divided, German nation. The argument ran as follows: Despite the

existence of two states, the division of the German nation could not result in the emergence of two nations in Germany. At the Seventh SED Congress on 17 April 1967 Ulbricht, for example, said that the nation now consisted "essentially of the two German national groups of two German states independent of each other." Though important political, philosophical and sociological manuals distinguished (in the abstract) between the bourgeois and the socialist nation, they did not speak of two nations in Germany. The "draft of a treaty on the preparation and nurture of normal relations between the German Democratic Republic and the Federal Republic of Germany" of 18 September 1967 mentioned the "sovereign states of the German nation."

The new constitution of 6 April 1968 defined the GDR as a "socialist state of the German nation." This formula was chosen--most adroitly--, because it did not exclude the existence of a second state of the German nation, in other words the Federal Republic of Germany. However, in early 1970 it was replaced by a new formula which had to be interpreted and judged as a specific reaction to the national tenets of the SPD/FDP Federal Government's Germany policy. Federal Chancellor Willy Brandt's first report on the state of the nation of 28 October 1969 used the concept of the nation to modify the formula of the existence of two states in Germany and the special relations between them. On 19 January 1970 Ulbricht riposted by proclaiming a new independent national formula for the GDR: "This is the historical reality: The German Democratic Republic is a socialist German national state, the West German Federal Republic a capitalist NATO state with limited national sovereignty."

The Bonn policymakers pronounced emphasis on the doctrine of the German nation's unity caused the SED to be pushed further and further on the national defensive in the 1970's. In late 1970 Ulbricht added another variant to his formula that the GDR is a "socialist German national State" (which amounted to a claim to sole national representation). On 17 December 1970 Ulbricht proclaimed his national creed in the course of a speech on the preparation of the SED's 25th anniversary. (NEUES DEUTSCHLAND did not print this for publication until 14 January 1971):

"The GDR is the socialist German national state. Within it proceeds the evolution of a socialist nation. Already irreversible facts exist in this context. The FRG is an imperialist state of NATO and embodies the remnants of the old bourgeois German nation in conditions of the state monopolistic ruling system."

Erich Honecker succeeded Walter Ulbricht upon his retirement from office as the head of the SED on 3 May 1971. Honecker retained only Ulbricht's thesis of the "socialist nation" developing in the GDR, not the formula of the GDR as the "socialist German national state." The subsequent months showed how little East Berlin was inclined to conclude an inner-German treaty which, according to the intentions of the Federal Government as enunciated by Federal Chancellor Brandt on 21 May in his 20-point Kassel program, was to be based on the unity of the nation. The Federal Government did not succeed in

anchoring in the basic treaty of 21 December 1972 the concept of the German nation, let alone the doctrine of the unity of the nation; nor does the treaty speak of the German people--only of the "people in the two German states." The preamble to the basic treaty firmly asserts the consensus on dissension in the "national question." This permits both states in Germany to sustain their divergent national attitudes.

At the time there was much speculation whether and in what form the SED leaders would use the 25th anniversary of the GDR on 7 October 1974 to press on with "national" independence and delimitation. By enacting the far reaching revision of the constitution of 6 April 1968 East Berlin decided on a radical "settlement" of the "national question." It renounced membership in the German nation and eliminated the official "unification" claim from the constitution. **Since 7 October 1974 the GDR is no longer a** "socialist state of the German nation" but--to cite article 1 of the revised constitution--a "socialist state of workers and peasants." It is therefore not surprising that the formula used in the preamble--"the vital interests" of the nation" --was also sacrificed in the revised constitution. The preamble now states that the "people of the German Democratic Republic...(have)...realized their right to socio-economic, governmental and national self-determination."

The SED leaders were soon compelled to acknowledge that the total removal of national formulas from the GDR Constitution did not suffice to call into question the continued existence of the German nation. Many GDR citizens wished to know whether they were still Germans. When, on 18 November 1974, Karl-Eduard von Schnitzler gave them a totally inadequate answer on GDR television and, at the same time, revealed the national dilemma which had resulted from the GDR constitutional revision carried out by the party and government leadership, SED chief Honecker was driven on 12 December 1974 to contribute--at a Central Committee Plenum--a new variant to the former national slogans and doctrines, which represented a remarkable correction of the amended constitution.

On the one hand he repeated the earlier stereotyped view (repeated to this day) that a "socialist nation" is developing in the GDR, "which differs in all particulars from the bourgeois nation in the Federal Republic." On the other hand Honecker distinguished for the first time between the citizenship and nationality of GDR citizens. He said that the "overwhelming majority" of GDR citizens were Germans "by nationality": "There is thus no room for any equivocation when completing questionnaires needed here and there. The answer to the pertinent question is simple and clear and without any ambiguity: Citizenship--GDR, nationality--German."

Here the SED chief refers to the definition of traditional German constitutional law, which defines the state people as the total of all citizens and --in the words of Rudolf von Laun--the "people in the natural meaning" as "nationality," a "social group existing independent of the law and the state." In subsequent years prominent philosophers and ideologues experienced in the issue of the national question as well as international lawyers

possessing the necessary flexibility and adaptability were called upon to develop a concept which was to be based on the following assertion: The "socialist nation" is emerging in the GDR, while the "capitalist nation" continues in the Federal Republic of Germany. These theses were not new: Some perplexity remained, though, about the question whether only the "socialist nation" evolving in the GDR was to be of "German nationality," or whether the "capitalist nation" continuing in the Federal Republic of Germany could make that claim also.

The pertinent GDR lexicographic works--such as the "Kleine Politische Woerterbuch" [Little Political Dictionary] and the "Kleine Woerterbuch der Marxistisch-Leninistischen Philosophie" [Little Dictionary of Marxist-Leninist Philosophy] do indeed list the word "Nationality" in addition to "Nation" and the "National Question." However, up to the mid-1970's "nationality" was not used in relation to the national situation in Germany. The first two editions (1967 and 1973) of the "Little Political Dictionary," for example, use the following definition: "Nationality: 1. A man's membership in a nation; 2. national group within a multinational state." By contrast the "Little Dictionary of Marxist-Leninist Philosophy," published in 1974, describes "nationality" as a "concept of Marxist social theory, which defines the physical ethnic basis and, at the same time, the historical beginning of the modern nation."

In his study, published in East Berlin in 1976, "Nation in Geschichte und Gegenwart" [The Nation in History and Now] Alfred Kosing, member of the Institute for Social Sciences at the SED Central Committee and leading GDR expert on the nation question, reported the following conclusions: "The overwhelming majority" (of GDR citizens) are "Germans by virtue of their origin, their language, their habits and traditions--in short their ethnic features, their nationality." He continued: "We are therefore justified in claiming that the German nation in the GDR is of German nationality." Kosing also concedes "German nationality" to the majority of citizens of the Federal Republic of Germany, because they speak the same language and "by and large" display "the same ethnic features: The socialist nation in the GDR and the capitalist nation in the FRG do not differ by ethnic features, by nationality, but by social bases and doctrines because we have here two qualitatively different historical types of the nation."

Kosing's acknowledgment that the "capitalist nation" of the Federal Republic of Germany also has "German nationality" represented something quite new because, in 1974, he was prepared only to subsume the "socialist nation" emerging in the GDR under the term "German nationality." Erich Honecker's thesis of 12 December 1974 also entered the new SED program of 22 May 1976, which states that the "overwhelming majority" of GDR citizens have "German nationality." A distinction is made between them and "citizens of Sorbian nationality."

We must note, though, that Kosing's thesis, according to which the "capitalist nation" in the Federal Republic of Germany has "German nationality" just

like the "socialist nation" in the GDR, has not affected East Berlin's Germany policy. The third and much revised edition of the "Little Political Dictionary," published in 1978, allows the attribute "German nationality" to the "socialist nation in the GDR" alone. Moreover, Gerhard Riege (for years the leading GDR legal scholar on citizenship issues in Germany) and Hans-Juergen Kulke, joint authors of the 1979 study "Nationalitaet:Deutsch --Staatsbuergerschaft DDR" [Nationality: German--Citizenship: GDR], do not even mention the "socialist nation" evolving in the GDR.

In the view of the SED leadership it has been an established fact since 7 October 1979 that even the "capitalist nation" persisting in the Federal Republic of Germany may enjoy the attribute "German nation." EINHEIT (the theoretical newspaper of the SED) No 9-10/1979 was entirely devoted to the celebration of the GDR's 30th anniversary. There Alfred Kosing and his colleague Walter Schmidt (who also works at the Institute for Social Sciences at the SED Central Committee) tried once more to separate the concepts "nation" and "nationality": "The nation in the GDR is socialist by sociohistoric type and by nationality. The nation in the FRG is capitalist by sociohistoric type and also German by nationality."

By the fall of 1974 the government and party leaders in the East were compelled to acknowledge that GDR citizens were not prepared to accept the two-state doctrine expanded to a two-nation formula and the far reaching abandonment of the attribute "German." Altogether dubious is the differentiation between "nation" and "nationality," by which all national references in Germany were to be reduced to ethnic features, thus making the "sociohistoric" element the sole and crucial criterion for the doctrine of the evolution of two nations in Germany. Kosing and Schmidt accuse the political forces in the Federal Republic of Germany of consciously confounding the concepts "nation" and "nationality" by failing to doubt the persistence of an undivided German nation.

They comment: "The nation includes within a dialectical unit economic, political, social and ideological relations which have a class nature, as well as ethnic ties which operate across several social configurations. Here the social-class-like factors and elements determine the origin, evolution and sociohistoric type of the nation. Nationality, on the other hand, merely describes the totality of ethnic attributes, features and ties within the population and the classes, groups and individuals who are its components."

In their polemics against the resolution jointly adopted by the ministers and senators for culture in the Federal Laender with regard to the handling of the German question in the schools neither Alfred Kosing, Walter Schmidt nor other authors have been able to prove that it is inadmissible to cling to the concept of the German nation. Consonant with the attitudes adopted by all parties represented in the Bundestag, the resolution is based on the consciousness of the community of language, history and culture, which is described as an important all-German tie. It continues:

"The efforts to achieve national unity are justified. Individual members of the nation must, in their capacity as citizens, have an opportunity to express their own wishes. The nation unites and embodies these individual wishes ascertained in proper and controlled procedures, and therefrom draws its legitimacy. Such a concept of the nation is not burdened with any excess significance such as racial superiority, historic mission or class mandate, in the name of which the actual wishes of the citizens may be falsified and rendered ineffective." (See FRANKFURTER ALLGEMEINE ZEITUNG, 6 February 1979)

Up to now the SED leadership has failed to demonstrate that a majority of Germans living in the GDR have accepted the doctrine of "two German nations of opposite sociohistoric type having emerged from the former united capitalist nation." If these statements were correct, the majority of Germans living in the GDR would no longer wish to form a German nation. So far East Berlin has not been able to submit a solid argument showing that this assertion is true.

For the SED leadership to use the occasion of 7 October 1979 to grant the attribute "German nationality" even to the "capitalist nation" claimed to exist in the Federal Republic of Germany must mean that it did not want further to isolate itself from its own citizens by imposing a national doctrine from above. The nonexistence of an undivided German nation cannot be commanded by "decree." GDR publications constantly repeat that the "developing socialist nation" in the GDR is an "irrevocable historic fact." This precludes any discussion. However, the constant toying with the "national question" and the construction of more and more national formulas clearly demonstrate that the SED leaders are not sure of themselves and argue from the defensive. Furthermore, East Berlin's politics disclose a rather odd interpretation of history, because there simply are no "irrevocable historic facts."

The GDR leaders--rightly--lack confidence in their own national doctrine and think little of the "national maturity" of their own population. This is demonstrated by the SED program which proclaims the illogical and actually absurd thesis that "the SED directs, as planned, the process of the further development of the socialist nation in the GDR, its flourishing on the social foundations of socialism and its adjustment to the other socialist nations."

Even before the almost total abandonment of national statements in the revised GDR Constitution of 7 October 1974, the opinion was championed over there that the "socialist nation in the GDR" was increasingly adjusting to the "fraternal nations of the socialist community." By now various versions of this formula have been inserted in the renewed treaties of alliance between the GDR and the USSR (of 7 October 1975) and Hungary, Poland, Bulgaria and Czechoslovakia (1977). On 12 May 1972 the GDR concluded the first bilateral treaty of alliance with Romania. However, the government and party leaders of that country totally rejected any thought of

"adjustment among the socialist nations" because this would conflict with its own national consciousness. Nor should we forget that politicians and scholars in Poland and Hungary have also maintained some reservations on this point, at least insofar as they permit themselves to stray from the Moscow line.

Despite the Kremlin's strenuous efforts to push ahead with the integration of the Soviet Bloc on the broadest possible front, the "adjustment" doctrine is bound to be unrealistic for some considerable time to come, because the national differences and peculiarities in the various "fraternal states" are much too great and "leveling" is not at all in the interest of all the countries concerned. We must also remember that some quite sharp differences persist in the Soviet Union also with regard to the national prospects of the closer "socialist community." The Soviet leadership is well aware of the problem of nationalism. That was shown very clearly in the course of state and party chief Leonid Brezhnev's speech to the Supreme Soviet on 4 October 1977, which justified the new constitution. He said the following:

"As we all know a new historic community of people has evolved in the USSR --the Soviet people. Some comrades...have drawn the wrong conclusions therefrom. They propose to introduce in the constitution the concept of a uniform Soviet nation...The sociopolitical unity of the Soviet people certainly does not mean that national differences have disappeared...We would adopt a very hazardous approach if we were to forcibly hurry up this objective process of the adjustment of nations."

It cannot be considered an accident that it is precisely the GDR leadership which pushes the formula of the "adjustment of socialist nations" to an extent unequaled in any "fraternal country." It wishes thereby to compensate the national vacuum in the "first worker and peasant state on German soil" and escape the "national reality" in Germany. The SED leaders are only too familiar with the hazards of its delimitation policy in the "national question." In recent years, therefore, they have made strenuous efforts to persuade their citizens that the working people in the GDR have by the "socialist revolution...for the first time in the long and fluctuating history of the German people" conquered "their own fatherland" and constituted themselves the "socialist German nation."

Lastly East Berlin's policy of national delimitation is designed to counter the postulate of Bonn's Germany policy, maintained jointly by the Federal Government and the Opposition, that the "German question" continues open in political as well as legal terms. On 7 October 1974, by changing article 8 of the constitution of 6 April 1968, the GDR abandoned the constitutional goal of the "reunification" of the two states in Germany. On 12 December 1974, speaking to his party's Central Committee, SED chief Honecker limited himself to the statement that the GDR "represents a socialist Germany...Incidentally, we continue to think that, in the course of the revolutionary world process, socialism will not pass by the Federal Republic of Germany either. That, however, is a matter for the future."

Neither of these statements was included in the new SED program of 22 May 1976. Exactly like the revised constitution, the SED program lacks any all-German outlook, let alone mission. It merely says "that all countries on this globe must inevitably come to socialism and communism." The SED thereby left the door ajar to the possibility at a later and more opportune moment to reformulate a total German future.

Basis of Nation-Nationality Theory

Cologne DEUTSCHLAND-ARCHIV in German Vol 8 No 11, Nov 75 signed to press 3 Nov 75 pp 1176-1181

['Analyses and Reports' feature article by Dr Albrecht Martiny, research assistant, faculty for East European history, Ruhr University, Bochum: "Marxism and National Question." A translation of the East Berlin NEUES DEUTSCHLAND article by Professors Alfred Kosing and Walter Schmidt, cited in footnote 29 below, is available in JPRS 64368, 20 Mar 75, No 1048 of this series, pp 43-52]

[Text] The signing of the GDR-USSR friendship treaty on 7 October 1975 has again made clear that the SED's policy of "Abgrenzung" [delimitation, separation] toward the FRG means a narrowing of its long-term policy on Germany. For W. Ulbricht, "socialist reunification" and "consolidation of the GDR" had been two possible variants of one single policy. The question cannot and is not to be answered here as to whether the new SED line is to be viewed as a broadening of the sense of political realism.[1]

In trying to justify their policy toward the FRG, the SED theoreticians rely primarily on two traditional theories: First on utterances by Marx and Engels and second, on statements by Lenin and Stalin--the latter, however, almost exclusively in the form of a national question, into which the more recent Soviet theory has amalgamated them. The present article will attempt to examine the justification and logic of such theoretical backing.

Marx and Engels About the National Question

Neither Marx nor Engels dealt systematically with the national question, with the role of the nations in the revolutionary process. Their position must rather be discerned from a wealth of occasional remarks, from newspaper articles, letters and so forth.

In the Marx-Engels economic-political system, the national aspect plays only a marginal role and, characteristically, usually appears in the narrowed sense of the national state. The national state, to Marx and Engels, amounts to something like a natural precondition for the formation of the domestic market, which in turn appears as an essential developmental condition for capitalist accumulation and, hence, as the logical framework for the emancipation of the proletariat. Marx' remark of 1845 that one could still find "only the bourgeois and their authors insisting on nationality"[2]

brings out clearly how little he understood the dynamics of the national struggles of his times.

Marx stressed especially the transitory nature of the bourgeois national state, given with the nature of bourgeois society. He considered the function of the national state finished by the victory of the proletariat: "With the class opposition within the nation, the hostile position of the nations to one another disappears."[3] Another formulation, in the "Communist Manifesto," sounds similarly optimistic: "The working men have no country. We cannot take from them what they don't possess. Since the proletariat must first of all acquire political supremacy, must rise to be the leading class of the nation, must constitute itself the nation, it is, so far, itself national, though not in the bourgeois sense of the word."[4] When Engels much later (1882), in a letter to Karl Kautsky, conceded that "an international movement of the proletariat" was possible only among "independent nations,"[5] that departure from earlier positions surely reflects above all his experience with contemporary history.

Very great, and decisive to their assessment of the national concept, was Marx' and Engels' disappointment in the failure of the 1848 revolution, which led Engels to some utterly exaggerated remarks directed against the "counterrevolutionary" Slavic peoples of Austro-Hungary.[6] The same attitude is found still later, for instance on the eve of the unification of Italy (1859). "No one will claim that the map of Europe has been drawn for once and for all. All changes, if they are to last, must by and large tend toward granting the large and vital European nations more and more their true and natural borders, determined by language and sympathy, while at the same time the national fragments still found here and there, no longer capable of national existence, remain incorporated in the larger nations where they either are assimilated or survive as merely ethnographic monuments without any political importance."[7]

None of all this indicates any theoretically justified criterion for deciding the question as to which European peoples should have a legitimate claim to an independent national state.

Actually, in Marx and Engels no more can be found than the differentiation between historical and ahistorical peoples, which was owed to Hegel, and the notion that certain nations have a vitality and power of assimilation, variously called social Darwinism--a criterion hard to integrate with "historical materialism."

By the same casual naivete by which Marx and Engels, on the one hand, assumed the formation of a German national state they, on the other hand, denied such prospects to the peoples of Eastcentral and Southeast Europe, with the exception of the Poles and Magyars. Neither of them, it turns out, were completely free of the nationalist trends pervading social structures at the time--with the national factor probably meaning more to Engels than to Marx. Yet another idea stood in the foreground in all such deliberations. In a letter to Engels shortly before the outbreak of the Franco-German war, Marx was rather frank: "The French need a whipping. If the

Prussians win, the centralization of state power will be useful to the centralization of the German working class."[8] It is a remark which clearly shows what, with respect to the unification of Germany, ultimately was in Marx' mind: the emergence of favorable conditions for the German labor movement. Also his rejecting the annexation of Alsace-Lorraine can only be understood by such overriding considerations. Marx foresaw that such annexation could add a burden to foreign policy which might be unhealthy for Germany's internal development and for the, to him, foreseeable confrontation with tsarist Russia.

If one wants to systematically put together the many facts in Marx' and Engels' views of the national question altogether, two criteria can be discerned. Decisive for their view on the historical right of a nation was, first of all, its importance to the European revolution, with their virtually consistent hostility to Russia playing an important part. Secondly, it would be its significance to the development of economic and social progress, which Marx and Engels could not conceive of other than in large national-economic spheres.[9]

A revealing example where their "nation concept had to be decided and tested"[10] was Marx' and Engels' attitude toward the Polish question, that is to say, what stand the labor movement was to take to the reestablishment of the Polish state that had been divided among the conservative powers of Prussia, Austria and Russia.[11] Marx' idea that Poland was to be liberated "in England,"[12] that the leadership of the revolutionary process, in other words, had to come to the proletariat of the economically most advanced nations, was complemented by his expectation that the Poles would combine their emancipation struggle with a class struggle. In view of the backwardness in development, that struggle in Poland could only be a struggle of the peasants against the land owning nobility. Marx' and Engels' advocating the reestablishment of the Polish state was thus logically tied to the condition that the national emancipation would go hand in hand with an agricultural-democratic revolution.

In their interlinking the national with the social revolution, it becomes visible that Marx and Engels subordinated the Polish question to the European revolution. What mattered to them was to shore up their revolutionary strategy, which concentrated on Western Europe, by winning alliance partners in the East.

This, mutatis mutandis, also applies to the foreign policy aspect of the Polish problem: The existence of a Polish state would have to disunite the dividing powers as much--especially, avert the Russian threat to the European revolution--as the decline of Poland had at the time united Austria, Russia and Prussia. Furthermore--in the eyes of Marx and Engels--a Polish agricultural-democratic revolution might become a spark for that kind of movement in Russia itself.

It was precisely this hope which made Engels say in a letter to Marx, after the 1848 revolution had failed, that Poland as a nation was "done with, was

a "nation foutue," that the Poles were to be denied the claim to nationhood from the very moment that the spark would in fact leap over to Russia.[13]

Through a more sober assessment of the revolutionary movement in Russia, Marx and Engels after the 1950's returned to a more positive view on Poland.

While such vacillations in their judgment were only temporary, they still give a clear indication of what Marx' and Engels' evaluation criteria amounted to: the independence of Poland simply does not constitute a value as such, in the sense of the right to self-determination,[14] as it were, but a variable factor with respect to the European revolution.

One should also point out Marx' and Engels' ideas of the borders of a new Polish state. While Engels temporarily advocated a reconstitution of Poland within the borders of 1772 (that is, before the 1st division), he soon thought the Germanization in the Prussian areas so successful that he dropped that idea in favor of expanding Poland at the expense of Russia. This reveals, on the one hand, a contradiction to the agricultural-democratic focal point and furthermore, above all, indicates small interest in and little understanding for the nationality problems in Central East Europe.

When the labor movement developed in Poland, Engels clearly resumed his support for the Polish national endeavors. Engels' preface to the Polish edition of the "Communist Manifesto" (1892) says: 'Poland's independence can only be won by the young Polish proletariat, in whose hands it is well placed. For the workers in all the rest of Europe need Poland's independence as much as the Polish workers themselves."[16]

The position on the Polish question, as sketched here, confirms the above mentioned assessment criteria for nationalist movements, and it impressively demonstrates that Marx and Engels, in orchestrating and simultaneously underestimating the national problem, not only were far ahead of their times, but by their judgment ultimately missed the dynamics of the national emancipation efforts in the Eastern part of Europe.

The More Recent Soviet Theory on the National Question

More still than to Marx and Engels, GDR journalism is relating itself to the more recent Soviet theory on the national question. It shall therefore be attempted here briefly to outline that position.

The Soviet historical journal VOPROSY ISTORII between 1966 and 1970 published a fairly open debate, that is, controversial in nature, on the nation issue.[17] The background of the debate lay in a widespread need for revising the Stalinist position on the national question. Even before World War I, Stalin had--on the suggestion and approval by Lenin--carried on himself a considerable portion of the polemics against the anti-national party leftists (Rosa Luxemburg and others) and, mainly, against Austro-Marxism.[18] He had since rated in the party as the expert on nationality questions.

If one subtracts from the polemic of those days that part which found its motivation in favor of a rigidly centralized party organization in Lenin's struggle against the Jewish "Bund" and the Caucasian social democrats, not much remains but the Leninist formula of the "right of the nations to their self-determination up to (national) secession," which however, when contrasted with Marx' and Engels' rejection of the right to self-determination, did mark a revision of secular significance.[19]

By taking over the self-determination right into the program of the Russian social democracy (1903), Lenin had found a tool by which he could not only combine all forces that were in opposition to tsarism, he also now had a formula which fitted in very well with the idea of revolution and which he, together with his analysis of imperialism during World War I, developed into a worldwide strategy.

Along with the democratic right to self-determination which Lenin had called for and emphatically defended against sharp attacks at the 1919 program party congress, for example, as Stalin's contribution had been regarded for a long time the nation concept he adduced to the Soviet theoretical tradition. The nation, to Stalin, was a "historically developed stable community of people, developed on the foundation of common language, territory, economic life, and a mode of character revealed in a common culture."[20] That nation concept clearly has to be defined as being a cultural-objective type. Especially important is the role attributed by Stalin to the territory.[21] In 1929, Stalin emphatically opposed the attempt to add "statehood" as a criterion to the constituent criteria of the nation.[22] Roughly since that time he also differentiated between "socialist and bourgeois nations."[23] This differentiation must be seen as a problematic attempt to place clearly ethnic-national categories alongside the forms of society of historical materialism. However clearly the nations of the Soviet Union and also of the GDR may differ from Western nations, due to their adhering to a particular social order, it yet remains unclear which criterion it is that will distinguish the soviet nations and peoples, "national in form, socialist in content," from other nations, from those of the Western type, for example. By failing to expand his nation concept by criteria of the (socialist) nation of the new type, Stalin, in differentiating between bourgeois and socialist nation, actually only projected his theory of "socialism in one country only" onto the national question. He was affirmative, in other words, and compensated for his theoretical weakness by attaching a cosmetic label. Here lies the eminently pragmatic and simultaneously conservative feature of the Stalinist theory on the national question.

Soviet journalism nowadays uses the formula of the "unfolding of the socialist nations." This, without doubt, takes its clue from Stalin's concept. For the medium and long range it stands in contradiction to the Marxist-Leninist traditional idea of the "rapprochement" or even "amalgamation" of the nations subsequent to the socialist revolution.

The nation debate in VOPROSY ISTORII was ignited by Stalin's nation concept. To understand that discussion one must be aware that, in the soviet view, national processes, mainly in the "third world" but also in the Soviet Union, have by no means yet been terminated or overcome through new types of societies. While noticeably reduced, there continues to be a vast gradient of development among the soviet nations and peoples. This as well as the difference in their political and legal national status obviously encumbers the formation of coherent theory.[25]

As major emphasis points in the nation debate in VOPROSY ISTORII emerged the discussions of a scientifically tenable typology of ethnic groups and their membership in societies formed by historical materialism. Controversial became mainly the attribution of "people" (narodnost') as a pre-national ethnic category to feudalism.

Along with it, some participants in the discussion sought to expand the Stalinist nation concept by introducing subjective factors, especially the criterion of "statehood."[26]

The fact that the major points of emphasis were raised precisely with regard to these two sets of issues shows their pertinence to the current situation of the soviet nationalities, inasmuch as their developmental prospects within the USSR are affected by both these aspects.

Characteristic of the many problems there are in the definition of the nation is that given by V. I. Koslov and G. B. Starutsenko in the 1967 Historical Soviet Encyclopedia: The nation is "a social-ethnic community of people which first forms during the transition from feudalism to capitalism. The nation differs from the ethnic community preceding it in the earlier stage--from the people (narodnost')--mainly through a greater internal cohesion which finds its expression in the creation of permanent economic ties, the formation of a unified national language, the development of an ethnic (national) consciousness, and so forth."[27]

If that definition is compared with the Stalinist definition, which had thus far been authoritative, the opening of the concept to new definition criteria becomes apparent above all. By explicitly including the "ethnic (national) consciousness" among the determinants of the nation, and by their criticism of "vulgar materialist concepts that deny the important role of superstructure factors, especially of the state,"[28] Koslov and Starutsenko have left the Stalinist tradition far behind.

In examining the theoretical utterances by Marx and Engels about the national question we found, on the one hand, how closely they were tied to the particular historical context in which they were made; abstracting them from that runs the risk of turning them into dogma. It also brought out, on the other hand, the unrelieved conflict between a more or less naive recourse to the idea of the national state as the developmental framework for modern society and the anational task postulated for the proletariat in a world historical perspective.

The Soviet theory on the national question likewise showed a mediate and yet close interlinking with the concrete contemporary situation, that is, with the specific problems inherent in a multipeople state. It stands within the field of tension between the need for planning and managing socioeconomic developments and the practical experience of spontaneous national rules in their own right.

In an authoritative statement in NEUES DEUTSCHLAND, one of the expert SED theoreticians, A. Kosing, attempts to define the national question by differentiating between German "nationality" and "nation" in support of the "demarcation policy" of the SED. Clearly recognizable in this is the confusion of concepts standing out against the background of the Marx-Engels as well as the soviet position on the national question:

"The complex of ethnic characteristics, the nationality, emerging with the merging into feudal peoples, was no doubt an important prerequisite for the subsequent formation into capitalist nations."[29] Nationality is seen here as national character, as "complex of ethnic characteristics" in the ordinary sense. Kosing continues: "Nationality provided the natural historical ethnic foundation for the future nation."[30] Here already the meaning of the word "nationality" shifts in the direction toward the ethnic-national corollary of the feudal form of society, which has clearly become subject of debate in soviet theory, where the term is "narodnost'" ("people" in the precapitalist stage). That this very meaning is intended, is shown by Kosing's quotation from Engels: "Once there were diverse linguistic groups, it was only natural for them to serve as the basis for the forming of the state, for nationalities to begin to develop into nations."[31] This quotation certainly means something very different from a "complex of ethnic characteristics." What Engels rather has in mind, and precisely so, are those ethnic structures that have not yet become nations.

This example makes clear that by differentiating between nationality and nation the SED, independently and unencumbered by traditional ties, with daring, has broken new ground.

FOOTNOTES

1. L. Niethammer and U. Borsdorf have found among the West German population a "national" reorientation, calling it a "cryptonational state-society normalization." Cf. "Traditions and Perspectives of National Statehood," "Aussenpolitische Perspektiven des westdeutschen Staates" (Foreign Policy Perspectives of the West German State), Munich/Vienna, 1972, p 82. A new friendship treaty in any case could amount to another indication of consequence to the Niethammer finding. -- The most recent study of the topic SED and nation, the Bochum social science dissertation by R. Koenen, is by and large merely a compilation of quotations from dictionaries and the SED's theoretical journal EINHEIT. Koenen's position is emphatic: the SED's double-track Germany policy continues undiminished. Yet, as he supports his thesis on

none but pre-1970 utterances, Koenen's argument is not all that convincing. Cf. R. Koenen, "Nation und Nationalbewusstsein aus der Sicht der SED" (Nation and National Consciousness From the Vantage Point of the SED), Bochum, 1975, p 11 and passim.

2. MEW (Marx/Engels Werke, "Works"), Vol 3, p 458, cited from H. Mommsen and A. Martiny, "Nationalism and Nationality Question," "Sowjetsystem und demokratische Gesellschaft" (Soviet System and Democratic Society) (SdG), Vol 4, cols 623 ff.

MILITARY CARTOGRAPHIC SERVICE DESCRIBED

East Berlin VOLKSARMEE in German No 37, 1980 signed to press 8 Sep 80 p 11

[Article by Lt Col W. Goeldner: "A Peek at the Maps--Notes After a Visit to the Military Cartographic Service (MKD VEB): With the Oldest Network of the World; A Road 900 Meters Wide; Hard Fighting in the Valley of Treacherousness; One Scale for all Mapmakers"]

[Text] What is a map?

For anybody who asks this kind of general question, Erich Mater's "Ruecklaeufiges Woerterbuch der deutschen Gegenwartssprache" [Contemporary German Dictionary] contains 137 concepts ending with the word "map."

What is a map?

In Altenburg they would answer the question in this way: visit our playing card museum; at the advanced ticket sales box office of the Distel night-club: sold out; at the train station: rumors to the contrary not withstanding, we do not make out any train cards but only train tickets and the sign will show you when the ticket window is open.

What is a map?

Good student Ottokar might think that map means "...the big, printed piece of paper which the officer in the lead vehicle of the column pulls out of his pocket every time and studies carefully before he shakes his head and asks my Mommy how to get to the maneuver area." That brings us a little bit closer to what we are after because we are obviously dealing here with a topographic map and that is the essence of our question.

What is a map?

A topographic map is the "reduced-size, generalized, mathematically determined representation of the surface of the earth in a plane showing the distribution, the state, and the interrelationships of the various natural and social phenomena."

This concept definition came from Soviet Professor K. A. Zalichev. It is also used by the comrades at the Military Map Service (VEB [State Enterprise]) in their work. In the course of their conversation they again and again point out the internal contradictions within each topographic map:

Each map is an individual thing which however can be reproduced in almost unlimited editions combined with maximum original fidelity;

Each map is a kind of work of art, designed and developed through creative work but at the same time made according to strict rules and regulations;

Each map is, in itself, a model of accuracy in terms of reproduction but also represencs a more or less big compromise in relation to the reality illustrated.

Just exactly what that means specifically is something we learn from the mapmakers--the map editors, the cartographers, the map printers; we also learn that from the copying specialists, the photographer, and the correction specialist; or from the very professional "map layout girls" who glue maps on fabric on huge tables.

A Proud Future for 'Spot Removers'

All mapmakers are professional explorers. That is so not only because they reproduce every piece of the earth's surface in the proper image without however having seen it in nature in each case, in other words, they so to speak have to rediscover it for the purpose of making the map. This is also the case because they feel tied to the age-old tradition of land surveyors, those people who regularly, even before the geologists and the virgin-land pioneers, before the drilling machine operators, the street and city builders, arrive on the spot in order thoroughly to remove those "white spots" which in some of the older maps rather with embarrassment were marked "terra incognita"--unknown land. The mapmaking profession today is a piece of human history. The oldest map, scratched into a clay tablet, is 4,500 years old. The various ways of making maps extend from a primitive observation sketch to the telemetrically transmitted satellite map. But the mapmakers to this very day work with the world's oldest grid: for almost 2,000 years, maps have been subdivided for the purpose of place determination by the degree grid and topographic maps are additionally subdivided by the topographic grid.

Maps are made in certain scales. The scales which army personnel and Military Map Service (VEB) personnel are handling can, so to speak, be summarized in three categories:

Large scales, in other words, those with the small scale numbers, such as 1:10,000;

Small scales, those maps with the large scale numbers, such as 1:3,000,000;

High criteria--in other words, the scales or yardsticks which everybody uses in measuring his own work and that of the group.

What the mapmakers produce is used primarily by the units in the field and, in a very special area, provides backup support for the military protection of socialism. High yardsticks here again are the criteria for party congress preparation: all groups and teams will successfully defend their state title; the comrades and colleages want to meet the Plan '80 targets ahead of schedule in terms of assortment and quality and on top of that they want to turn out finished products amounting to the production output of 3 working days.

It All Began in Sofia

To continue on the topic of the uniformity of scales and criteria also in the broader sense: the mapmakers in the countries of the socialist community--according to an agreement arrived at in Sofia in 1953--work according to uniform basic principles. If one realizes that, for example, even today, topographic maps are made in Great Britain according to such outlandish scales as 1:10,560 or 1:63,630, we particularly clearly see the advantage of socialist teamwork in the field of cartography. In the Warsaw Pact countries, all topographic maps are produced in a conform, lateral-axial cylindrical projection according to the earth ellipsoid of Krasovskiy and the 6°-meridian strip system. Symbols, coloring, and lettering on maps are standardized. It is quite obvious that this kind of standardization also represents a by no means negligible advantage when it comes to collaboration among the brother armies in the defense of socialism. It is also obvious that such internationally-determined requirements can be met only through a maximum of accuracy and quality. Confirmation of all of this can be found in the divisions of the Military Map Service (VEB). It is difficult to select only three examples of this among so many.

Of Sponsors, Examiners, and Checkers

Gisela Kuhwald, a cartographer who has been with the service since 1958, works as a map correction specialist. "What are the most important points here? Care and exactitude," she tells us. On her desk we find, as the most important reference works, the drafting regulations, the instructions and the editorial guidelines, within easy reach. She uses them to gauge the selection in terms of content, the graphic accuracy and the completeness of the data in the map draft which she is supposed to check and process. She loves to show us her graduation project, so to speak, which she made as a cartographer once upon a time, a hand-drawn map segment with a scale of 1:250,000, which cannot be distinguished from a first-form print. "But today we draw by hand on paper only in exceptional cases; the trend is toward automated map production." Being a cartographic specialist is an interesting occupation with good promotion opportunities--not just for girls, either. The Military Map Service (VEB) which also has a training division, offers jobs also for male trainees. "Of course, we help our young colleagues

get started after their specialist examination. In my group, every new worker has an experienced sponsor. That is only proper in a team which is now defending its state title for the ninth time!"

Manfred Roth, a reserve NCO, once upon a time, as senior steward on the MS "Frieden" in Haiphong experienced a terror bombing raid by American bombers. He worked as a photographer at the microfilm facility whose output is important in making sure that the requirements of the field units can be met quickly and expertly. His competition goals: ahead-of-schedule completion of all microfilming tasks coupled with a conscientious degree of self-control "because if the density is not there, if the black-white ratio on the films is not accurate, then the whole thing is useless." His group leader Monika Kaufhold is proud that "reciprocal replaceability is assured in the reproduction sector and we are ready immediately to switch to shift operation in case of increased work requirement."

Wolfgang Placke was a radio operator in the Johann-Philipp-Becker Regiment and is now a map printer working on a Planeta four-color offset machine which turns the final product of the mapmakers out with four "runs" (in other words, maps per printed sheet). The future printing engineer--he is taking correspondence courses--became a SED membership applicant in preparation for the Tenth Party Congress. "Of course, quality first of all depends on the print, on the color, and on the LKO, which happens to be the abbreviation for map offset paper--but we do influence the quality by maintaining the color and the matching and that is what we are really proud of," Comrade Placke assures us.

Not Putting All Eggs in One Basket!

The comrades and colleagues at the Military Map Service (VEB) are justifiably proud of their quality products. With equal justification they expect expert knowledge on the part of the users in handling topographic maps. Based on their experience, they point out:

That not every forest trail can be shown on a 1:200,000 map; a reduction in the map scales signifies not only an area reduction but also a reduction in the objects that can be illustrated;

That complete and realistic reproduction sometimes is impossible; there are quite a few "tricky little valleys" in the Harz mountains, and not only there, little valleys where streams, railroad tracks, roads, railroad stations, little villages, and ruins and finally contour lines literally struggle against each other for predominance in a very tiny space. The cartographer is the umpire and he must bring about a compromise. Compromise does not mean in every case that somebody is being compromised but here is an example: on a general map of 1:6,000,000, we are supposed to illustrate a road which is about 10 m wide. On the map, that is done with a minimum stroke width of 0.15 mm. Converting that back to reality, this would mean that the road would be 900 m wide.

Only the person who tries not to put everything on one map but to have the correct map for every job--only that person will be successful.

TIGHTER AIR SPACE SURVEILLANCE ORDERED

West Berlin DER TAGESSPIEGEL in German 11 Sep 80 p 3

[Article by Michael Mara: "The GDR Sees Danger From the Air: New Instructions in Training Guidelines for Border Troops"]

[Text] The Border Guard units of the GDR have been ordered to keep the air space along that country's Western border under observation more intensively. A training guildeline from the central command of the Border Guards, explains that "violations of the GDR's air space by aircraft from countries which are members of NATO had increased." The commando operation to free the American hostages being held in Iran, which had failed, has proved, the explanation went on to say, "that the imperialists will stop at nothing." This allusion suggests that the leadership of the Border Guards does not rule out the possibility of activities in which Westerners might help citizens of the GDR to escape through the air.

Another reason for the demand for careful observations and surveillance of the air space at the border could be the successful escape of two GDR families from Poessneck (Thueringen), during the night of 15/16 September 1979, in hot-air balloons they made themselves. The daring escape operation, which has attracted worldwide attention, obviously was noticed too late by the Border Guards.

What Does Not Fit the Image of the Enemy...

This has never been mentioned officically in the Border Guard units because it apparently does not fit the stereotyped image of the enemy which is used to motivate the troops to perform their guard duty efficiently, for according to that depiction of the situation the borders of the GDR must be guarded against threatening encroachments from the West. Not a single word in reference to the escape in balloons is mentioned in the training guide on air space surveillance.

Instead, Erich Honecker is quoted. At the beginning of this year, he asserted to party functionaries, that "provocations and plots directed against our national frontiers and violations of our air space" were increasing "in

scope and severity." Therefore, the head of the party claimed on that occasion, the GDR must "always be armed for any eventuality." Referring to this "policy of provocation," it is stated in the previously-mentioned training guide that they have "every reason to defend the GDR's air sovereignty actively and to keep careful track of their adversaries' activities. "The armed forces must be ready, every hour of every day, to foil provocations." It is possible to do this even if they have been prepared "long in advance." In this connection, the officers, noncommissioned officers and training personnel are given detailed instructions on the surveillance of air space.

In general, it is "extremely important to detect" flying objects" in plenty of time" and give exact, complete and accurate reports to headquarters quickly. Such reports are what is chiefly needed "to make actions by the forces which watch over the security of the GDR's air space" possible and permit the taking of decisive steps "to thwart imperialist adventures which would jeopardize world peace."

Emphasis on International Law

In that connection, the central command of the Border Guards states emphatically that "we only have the sensible actions of the organizations, staffs and units which are responsible for the security of the GDR's air space to thank for the fact that such actions by enemy forces have so far not produced any grave consequences." The violations of the GDR's air sovereignty constitute actions embodying "utter contempt for the sovereignty and integrity of the GDR." They are offenses against the provisions of international law and the principles concerning recognition of the unassailability of national frontiers laid down in the basic treaty between the GDR and the FRG. In official protests to the government of the FRG, the GDR has expressed itself in similar terms and suggested that the FRG agencies concerned "must bear exclusive responsibility for the consequences resulting from such air-space violations." It must be said that it is mostly sports aircraft which--often by mistake--fly over the GDR's borders and "penetrate" its air space.

Violations of air space by military aircraft belonging from the other side occur in both German states, and not much fuss is made about it in the FRG. In view of East Berlin's special sensitivity in regard to the "unassailability of national frontiers" and the abnormal conditions at the border between the two Germanies, however, Westerners who fly for sport should not ignore the GDR's warnings.

ROLE OF, ATTITUDE TOWARD SHOP STEWARDS HIGHLIGHTED

Budapest ELET ES IRODALOM in Hungarian 6 Sep 80 p 16

[Report by Andras B. Balint: "Trust the Shop Steward"]

[Text] Colleague Perenyi has been working for the enterprise for years. He is a quiet, diligent man, an outstanding employee. Nobody was surprised when the trade-union committee nominated him for section steward. His professional knowledge and reliability guarantee that he is able to suitably discharge the duties of this important office. He was elected unanimously.

Perenyi was on leave and learned about his election only a week later. He visited the secretary of the trade-union committee, who immediately expressed his best wishes and requested Perenyi to represent the interests of the workers to the best of his ability. Perenyi scratched his head and, with his customary modesty, said that he would gladly do everything, but there was a small hitch. The secretary raised his eyebrows. What kind of hitch? "I am not a member of the trade union," mumbled Perenyi, and began to search his pockets for his cigarette lighter.

He joined the trade union that very day, now that such high honor befell him.

I am walking through the yard of a plant in a Pest suburb, examining the piles of rejects and heaps of scrap. An old factory, with old shortcomings. It could do with some rejuvenation.

Well, never mind. I do not have to concern myself with such things on this occasion. The purpose of my visit is different. I am looking for Poker Face, an old acquaintance who allegedly was elected shop steward. His mouth is big enough once he drops his dead pan. You only have to get his goat.

The secretary of the enterprise's trade-union committee briefed me on the developments as follows:

"Since he did not hold any office, we thought he would be pleased with his nomination. Well, do you think he was pleased? He said he had trouble

enough. After all, there were his garden and livestock . . .. But after lengthy persuasion he finally accepted. He is here today, you can interview him."

I found my man behind the shop, pushing toward the shop's door a large industrial truck loaded with pipes.

"Lend a hand," he shouts from behind his reflecting glasses as soon as he recognizes me. "Can't you see that I am short of help?"

Pointing at the pipes, I asked him: "Are you taking these to be welded?"

"Where else? Did you think I was going to blow soap bubbles through them? Its the end of the semester, and we must push production."

Inside we sat on trestle chairs.

"I have 20 minutes for the press and reporters. NEPSZAVA already took up ten minutes. The remaining time is yours." And he offers me a cup of coffee.

"Congratulations on your election."

"Forget it. They elected me, so what can I do? I didn't even want to hear about it. But it is all the same now, I have accepted."

"Why were you reluctant?"

"The whole thing wouldn't bother me if my duties were the same as those of the previous steward. Selling stamps, collecting the applications for organized holidays, and so on. But since the abolition of the shop committees and the enterprise trade-union councils, the duties of the stewards have been broadened, and they have a say in everything. This is what I am afraid of. The steward is in the middle, and he is squeezed and slapped from above as well as from below. Who needs that?"

"Are you regretting already

"I wouldn't say that. It is barely a few weeks since the election, and I have not encountered any serious matters so far. But there will be trouble here, just as there was in the past. Isn't it better to remain a simple member? There would have been a person better qualified than I, but he refused the nomination outright."

The system of stewards has been a pillar of the Hungarian trade-union movement from its very begining. Before the liberation, the stewards directed the trade-union groups, they organized the strikes and actions of solidarity. After the liberation, the trade union wielded independent political power and played an important role in reconstruction, in the nationalization

of industries and in preparing the merger of the worker parties. Later the trade unions were pushed into the background, and the party's sectarian leadership regarded practically as superfluous the trade unions' function of safeguarding the interests of their workers. Subsequently the structure changed and the workers' interests were represented primarily by the shop committees, the works committees and, at the highest level, by the enterprise trade-union councils. The councils were abolished this year and replaced by committees of stewards. The tasks of the lower-level committees were taken over by the stewards and chief stewards. Of the previous committees, only the enterprise trade-union committees have been retained.

The deputy chief of the SZOT [National Council of Trade Unions] Organizing Department says: "The elections in the trade-union local organizations this spring proved that most locals found suitable persons, members who enjoy respect in the factory or office.

"You ask how managers are reacting to this. Well, not all of them are happy, because they feel that some of their decisions might encounter opposition. But the objective was to make the steward a partner, not a minor subordinate who dances to the boss's tune. The trade unions do not enjoy any respect where they have not succeeded in nominating suitable stewards, or where the director is a very strong personality."

The powers of the steward are fairly broad. His consent is necessary in setting the personal basic wages of his coworkers, in proposing them for decorations, premiums, social benefits and aid; he has the right to express an opinion, to submit a proposal and to control any matter that affects the interests of the workers. And he may propose that the trade-union committee exercise its right of veto whenever the manager acted improperly or made a decion that violates socialist morality. The committee's veto rescinds the illegal decision.

All this is very nice. But where will you find a steward who will actually avail himself of his opportunities and exercise all his rights. Recently I attended a political debate on democracy at the workplace. A young economist argued that the trade union at his enterprise was unable to function effectively for two reasons. First, all trade-union officials were immediate subordinates of the big boss and professionally were far below him. Secondly, the boss gives the trade-union officials numerous benefits (for example, he illegally freed the trade-union secretary of other work assignments), and in exchange for this he wants only one thing: that they do not interfere in anything. And there is indeed no dispute between them. Year after year, you read in the annual report that relations between management and the trade union are excellent.

And no wonder.

I read in TARSADALMI SZEMLE: "The trade-union steward performs his duties well if he consistently fights for the partial interests of the individuals and groups whom he represents, preferably on the basis of higher interests,

but occasionally also without regard for the higher interests formulated by management and approved by the party organizations as well . . .. Managers and even party organizations sometimes demand of trade-union stewards that they approve, unconditionally and without criticism and opposition, management decisions that--as the managers are firmly convinced--are direct incarnations of higher-order interests. Such demands are understandable, but we cannot approve of them in any circumstances."

The SZOT official says that the steward should be a partner. But how? In 1978, at a large enterprise in the building materials industry, 75 percent of the shop stewards had only eight grades of formal education (or perhaps not even that much), whereas one-half of the managers had secondary education, and one-third were university graduates. How can the steward with only six grades of formal education be a partner of the director who is an engineer?

When I asked Poker Face about this, he replied: "A partner? No way. I myself am a skilled worker, and even I am afraid. Funny things have happened here."

"What kind of things?"

"It happened last year. Kovacs, the department manager, started disciplinary proceedings against the maintenance foreman. The foreman was dismissed without notice, on gorunds of incompatibility. At a party he had made some derogatory remarks about the boss. Somebody had secretly recorded his words on tape and played them back to Kovacs. The latter blew his top and brought the disciplinary decision."

I was making notes. Poker Face stared at me.

"I hope you don't intend to write about this."

"Why do you think I am here?"

"Then I too will be fired. At least change the names. OK? Well, the foreman appealed to the labor arbitration board and also filed a civil law suit against Kovacs, for violation of the foreman's personal rights. At the proceedings of the arbitration board, the enterprise's legal counsel repeated the resons for the disciplinary action and requested the board to confirm the dismissal. The foreman contended that he was not incompatible, had not incited anyone against Kovacs but retained his opinion of the latter, and this was no grounds for dismissal."

Poker Face lit a cigarette and blew symmetrical rings into the air.

"Next came the group steward, the maintenance clerk. He was supposed to testify in the dismissed foreman's defense. And he did indeed testify. He said that the foreman was truly incompatible if he claimed that the highly esteemed Comrade Kovacs had . . .. Well, you understand. The arbitration board confirmed the dismissal, without debate."

"And the tape recording. Was that true? Can such a thing happen?"

"Hold your horses. The foreman won the civil law suit. He then hurried to the labor court. After a ten-minute hearing, the disciplinary action was rescinded and my fellow worker was reinstated in his job."

"Could I speak with him?"

"By no means. He was reinstated, worked for a week, and then he gave notice. With head erect, he went to work in a neighboring factory. He is earning a forint more per hour. And he deserves it, in view of his skill."

"Eva, how long have you been active in the trade union?"

"For 20 years. For one thing, this is my field of research. For another, I too am a trade-union official, here at the institute."

"A manager recently asked me from whom was the trade union protecting the workers. From the people's power?"

"In the Rakosi era the trade unions' authority was curtailed with this argument. Even today there are dogmatists who belittle the trade union, look down on the trade-union officials and practically regard the workers' organization as a burden. However, everyone at his own post must fight for his right. The party recognized a long time ago the role of interest relations in socialist society. It recognized their role and said that they must be taken into consideration. This is also the basis of the organized protection of the workers' interests."

"Some spokesman or other of the Western labor movement will nevertheless underestimate and belittle our trade unions."

"Today only the most obdurate anticommunists do this. The fact that Hungary's Sandor Gaspar has been elected president of the World Federation of Trade Unions is a recognition of not merely his person. Western delegations frequently are amazed at the broad authority of the Hungarian sister unions. In some instances our trade unions exercise what amounts to public authority. Management and the government may take certain steps only with the trade union's consent."

"What do you have in mind?"

"The SZOT must countersign all decisions of the Council of Ministers that directly affect the workers. Last year, for example, extensive debate preceded the decision on the amount of supplementary pay to be granted after the price increases."

"It could have been more."

"There was not enough money, and we were simply unable to vote more. But I could cite instances when the trade union's opposition was successful and

we were able to reach sound compromises. In the case of employment for youths, on the issue of overtime . . .."

"Tensions arise also in our country between employers and employees, in the same way as in the West. There, if negotiations finally break down, the employees go on strike. Can this happen in our country?"

"During the past twenty years, in entirely exceptional cases, work stoppages in the nature of warnings did occur. They were of short duration. For even though our socialist system does not prohibit the expression of one's opinion even in this form, such crude means generally are unnecessary in our country, because the opponents are not class enemies. The less so because over there a strike reduces the capitalist's profit, but here we would be reducing our own assets."

A friend, a technician at an iron and steel works, told me the following: "The end of the year was approaching and we were lagging in plan fulfillment. There was not enough raw material, and without it we were unable to produce. Well, a large shipment arrived in November and we could start working. Management begged and ordered that everyone should put in as much overtime as possible, and promised to pay us handsomely. No special encouragement was necessary. The workers needed the money, the double and even higher pay for overtime. Believe it or not, some workers put in 48 hours without interruption, merely catching a few winks in the storeroom or the boiler room. The trade union was persuaded that the enterprise's interests came first, because the domestic market had to be supplied, and our export commitments had to be met . . . .

"But wait, I am not yet finished. We drove ourselves until the end of December. Christmas, New Years and everything merged into one. And then the raw material ran out. We overfulfilled the plan, and a quiet January arrived. There was time to rest. However, the workers were not pleased even with this, because they were able to take home barely 2000 forints: their simple pay and nothing else. There were complaints and wide dissatisfaction. And who talked the most to quiet the workers? You guessed it, the trade-union secretary."

Briefly about the other tasks. Not because they are of secondary importance, but because our topic is the steward and the protection of the workers' interests. However, we must mention the "other" matters since they are an essential part of trade-union work.

The trade union performs an important cultural function. It maintains the plant's cultural center, organizes political seminars, manages the library, recruits workers to attend theater performances, etc. It has helped hundreds and thousands to broaden their general education, to complete the schools for workers and to gain qualifications as skilled workers.

The trade union participates in the allocation of the social and cultural funds, distributes aid, assumes a lion's share of industrial safety. It

organizes relatively low-cost vacations for adults and children, providing meals and entertainment for vacationers.

The trade union regularly inspects the factory dispensaries and devotes close attention to workers assigned to jobs under hazardous or harmful conditions. Together with management, the trade union organizes the enterprise's housing program and helps to select the applicants who need homes of their own the most. It helps young people to adjust and advance, and it organized programs for young people who are not KISZ members.

All this was brought up at the political debate mentioned earlier. A young lawyer, one of those whizz kids, asked why we have only industrial unions. In his opinion, in debates at the work place or in questions concerning social policy or education and culture, the interests of the blue-collar workers and those of the intellectual in management are not identical, although they are employed in the same industry. At one time the trade unions accepted only employees as members, and employers had their own organizations. Yes, he realized that the director and the chief of the department also were employees, but their position in the social hierarchy was quite different from the position of the blue-collar workers.

My discussion with Poker Face is nearing its end, and he is getting ready to go back to work. But then he again sits down on the trestle chair.

"One thing more. At last week's meeting of the committee of stewards I heard with consternation that the number of trade-union members at the enterprise dropped by 30 since last year, while the number of blue-collar workers increased somewhat. The majority simply do not pay their dues and thus expel themselves from the trade union. But there were a few who turned in their membership cards."

"You don't say. And what was their reason for doing so?"

"They did not receive aid or were removed from the premium list, unjustifiably in their opinion. In other words, they were dissatisfied with the trade union. Some of them were right. At the first meeting of our group I told the fellows that I would do everything in my power for them if they helped me. If they told me and discussed with me what, how and why they wanted, I would get it for them with my bare hands. And for myself as well."

"In other words, you wanted them to trust their steward . . .."

"Of course, this applies only to those members of my group who deserve my help. The loafers, the ones that only talk and have no sense of responsibility do not deserve even to let the sun shine on them."

IMPORTANCE OF POLITICAL DIALOGUE FOR PEACE

Bucharest ERA SOCIALISTA in Romanian No 15, 5 Aug 80 pp 20-23

[Article by Victor Duculescu of the Stefan Gheorghiu Academy]

[Text] The evolution of international relations places in the forefront of the present time the demand for completely abolishing resorting to force and threatening with force, for prohibiting any kind of interference in the nations' internal affairs, for solutions exclusively through treaties and political dialogue for any litigations between states. Under the conditions of intensification of the contradiction between the imperialist policy of force and dictate and hegemony and redivision of the world into spheres of influence and the policy of detente, national independence and peace and disarmament and security, the active cooperation for regulating the great problems confronting mankind today is becoming the vital desire of broader and broader political circles and social forces and of people all over the world.

The "cold war" concepts and practices in no way can represent a viable alternative for solving the world problems of the 80's. The policy of force never has succeeded in offering viable solutions for solving the problems with which mankind has been confronted during its thousands of years of history. Also, resorting to force and threatening with force and interference in the internal affairs of other nations always have caused an emphasis on states of tension and strain. Of course, it is a positive thing that force and threatening with force today are actions prohibited by international incriminated by important international documents, primarily the very Charter of the United Nations. As the American professor Louis Henkin rightfully stated, "the main development of international law in our era is the law of the United Nations Charter, which removes the use of force in international relations outside the law."*

* Louis Henkin, "How Nations Behave, Law and Foreign Policy," second edition, published for the Council of Foreign Relations by Columbia University Press, New York, 1979, p 135.

Although a broad constellation of international documents, resolutions governmental and nongovernmental, bilateral or multilateral documents assign the prohibiting of force and threatening with force as a standard of behavior which is obligatory for all states, without any exception, the practical application of this basic principle of international relations is a process which takes pleace slowly, encountering many obstacles along its path. Flagrant violations of the standards of unanimously recognized international law continue to take place, actions of force and threatening with force are resorted to and military preparations are being intensified to maintain or fortify the influence of the leading circles in various states in different parts of the world.

The facts prove that very often some diplomatic offices and statesmen do not even conceive of eliminating force from their way of thinking let alone from the practice of their political actions. Whereas there is unanimous agreement that resorting to force as such between states is a remnant of the past, in exchange, the most varied pretexts are sought in order to find ways to "legitimize" the use of it. "Humanitarian" reasons, claimed "interests" of some states or groups of states which supposedly are in danger, "historic rights," "superior objectives," old and new geopolitical doctrines and theories are frequently invoked as a support for the policy of force, hegemony and dictate. As Yugoslav author Cvijeto Job correctly observed, "If we would accept all the 'explanations' for aggressions or interventions, there would be no more aggression and intervention would become something good, indispensible and inevitable and always useful."[1] Noting the same aspect, political scien ist Werner Levi drew attention to the fact that "the greatest difficulty in making the law against the use of force effective is that the states find a great variety of reasons for using force."[2]

Despite the pertinent arguments showing the need for taking and fortifying the course toward detente and avoiding military conflicts and solving litigious problems between states exclusively through treaties, we still encounter in western literature viewpoints which try to theorize on the idea of the "inevitability" of military conflicts at the local and even global level. For example, the old theories on the correlation between war and policy elaborated by Karl von Clausewitz still enjoy an audience in specialized circles. Of course, if the idea of the correlation between war and policy (more precisely, between war and a certain policy) could be kept as a research hypothesis, it is certain that some conclusions of today's followers of Clausewitz are totally unacceptable for modern political science; they attempt to "develop" his theory and "adapt" it to the phenomena of today's world. Thus, Peter R. Moody, Jr., an American researcher from Notre Dame University, in a study dedicated to Clausewitz' doctrine, arrives at the incredible conclusion that "modern society and total war evolve together. Their relationship is at least that of a symbiosis but, more likely, that of a relationship between

1. Cvijeto Job, "La Non-Ingerence et la Non-Intervention" in REVUE DE POLITIQUE INTERNATIONALE, XXXI, No 720, 5 April 1980, p 7.

2. Werner Levi, "Contemporary International Law: A Concise Introduction," Westview Press, Boulder, Colorado, 1979, p 306.

body and soul." That same researcher feels that the current international structure--causing conflicts--"is apt to change only as a consequence of total war."*

It is clear that such opinions reflect states of affairs established in flagrant contradiction with the nations' interests and the aspirations for equality and peaceful collaboration of nations and that they express concepts proven obsolete in the organization of international relations. The relationship between modern society and war is far from being "symbiotic"; on the contrary, there exists a clear incompatibility between society's progress and military conflicts between states, regardless of whether it takes the form of "local wars" or "total war." The least careful analysis of the evolution of interstate relations shows that war never was a factor in the progress of human society but, on the contrary, always caused incalculable losses and hindered the economic and social development of mankind and his progress along the path of progress and civilization. Especially in today's international situation, under the conditions of the existence of particularly complex problems, any conflict can only lead to a stress on political tension ,representing a grave danger for the people in those zones as well as for peace and international security. That is why it is necessary that everything be done, as continually stressed by our party and state, to solve any conflict only through treaties, to avoid the break-out of other new ones, and to normalize relations between all states.

Whereas it is true that the policy of force in itself bears the possibility for unleashing conflicts at various levels and even a "total war," in exchange it is inconceivable that a total abstraction be made of the existence of a series of factors in the world today, in evaluating the problems of the imminence or lack of imminence of military conflicts, which act precisely against the degenerating of conflicts between states into wars and which, of course, make it fully possible to regulate these con flicts through treaties, through peaceful means and avoid new wars. On the other hand, it is difficult to allow the idea that a change in the international system would be possible as a result of a "total war." As we know, there would not be either victors or losers in such a war. Today it is unanimously admitted that a nuclear war would lead to incalculable destruction, questioning the very existence of all civilization, and everything which human genius created throughout thousands of years. Referring to the various reasons or pretexts which could be invoked to aid in launching armed conflicts, Comrade Nicolae Ceausescu stressed in the speech he gave at the recent forum of the young generation that "there is no reason, no justification, no ideal in whose name mankind should be thrown into war and destroyed! We must give a decisive NO to this policy and fight for a policy of peace, of collaboration and equality of rights!"

In our age of the deepening of world interdependencies and the coexistence of countries with different areas, populations, directions and traditions, political negotiations and dialogue between states are the single rational alternative for a long-lasting and effective solution to the problems of international

---

* Peter R. Moody, Jr., "Clausewitz and the Fading Dialectic of War" in WORLD POLITICS, Vol XXXI, April 1979, No 3, pp 433, 432.

life. Regardless of whether it is a question of bilateral talks or multilateral actions which involve the participation of many states, political dialogue offers the peoples' representatives the single effective method for closing any sources of tension and conflict and for working out formulas for collaboration which do not create unilateral advantages but which equally satisfy the interests of the particular countries as well as of other countries and peoples.

The abolishment of force and resorting to treaties is not a proof of the partners' weakness but, on the contrary, a full recognition of their equality and the sovereign rights of all states, an appeal to reason, to a mature understanding of the realities of today's world, which demand the equitable solution to conflicts in the spirit of peace, collaboration and good-neighborliness. This also explains why more and more social forces and broader and broader political circles today are coming out for solving the divergent problems between states through negotiations and to initiate treaties for all problems where a common interest exists.

These realistic opinions also were brought out during the last World Congress of Political Sciences in Moscow in 1979. Max Mark, an American specialist from Wayne State University, for example, felt in a report presented during this congress that "the current evolution of world problems may best be described as a process of getting away from the traditional policies based on force and the threatening with force."[1] Detente "as a policy which results from existing international realities," G. Arbatov, well-known Soviet scientist, pointed out in turn, "is the single effective answer to the provocation of international tensions and the rising dangers of conflict in the modern nuclear era. The detente process requires abolishing outdated concepts and adapting to the new world realities in order to cope with the existing and future problems."[2]

Theses on the "timeliness" of the so-called "humanitarian interventions" currently are being broadly disseminated among circles concerned with continuing to justify the resorting to practices of the policy of force and dictate. What do the authors of such theses maintain? In an article published in this April's well-known publication LE MONDE DIPLOMATIQUE, entitled "Respect for Sovereignty or the Duty To Intervene?", Prof Mario Bettati of the University of Southern Paris, seeking arguments to justify admitting some "exceptions" from the principle of nonintervention in the internal affairs of other states, actually initiates a true "campaign" against national sovereignty. He tries to justify his thesis by no more or less asserting that "the shrine of sovereignty no longer can hide the prisons of liberty and nonintervention no longer can protect the refuges of the tyrants, while noninterference no longer can guarantee the gravediggers' job."[3]

---

1. "International Political Science Enters the 1980's," abstract of papers presented at the XI World Congress of the International Political Science Association, Moscow, 12-18 August 1979, Edited by Richard L. Merrit, Volume I, p 15.

2. Ibidem, p 6.

3. Mario Bettati, "Respect des Souverainetes ou Devoir D'Intervention?" in LE MONDE DIPLOMATIQUE, XXVII No 313, April 1980, p 11.

It is clear, even for the least informed observe , that such theses or theories, without in the least serving the cause of human rights, do not serve the detente process in any way or the idea of respect for the principles and standards of international law. On the contrary, basically pleading for "legitimization" of demonstrations of force and for finding subterfuges which justify intervention in the affairs of other states--but not for a peaceful, negotiated solution to conflicts and problems of international life--they incite the imperialist and reactionarycircles which are hostile to detente and peace, to the nations' sovereignty and national independence. Not one consideration, not one pretext, regardless of the form in which it is presented, can justify resorting to force and threatening with force and interference in the affairs of sovereign and independent states. Detente and peace, understanding and collaboration among nations can only be built if the policy of force and dictate, interference in the internal affairs of other states and the policy of spheres of influence are rejected and only if a policy based on respect for independence and national sovereignty and on full equality of rights is promoted.

Of course, it is understandable that negotiations must be carried on in a spirit of full equality of rights, respect for the interests of each party and receptiveness to the partner's opinions in order for them to be productive and to truly serve the interests of the nations' peace and progress.

Rejecting any theories for organizing relations among nations which tend to underestimate the value of sovereignty and find pretexts for interference in the affairs of other states and for resorting to force, the nations have powerfully shown that in no way are they disposed to accept the role of "objects" of history and passively be present for the evolution of international relations. As Giancarlo Pajetta correctly noted in a recent article," No country is big enough to impose its will and no country is too small to refuse to play the role of protagonist. It is not a matter of simple feeble intentions. Zimbabwe has proven to us that the demand of South Africa and Great Britain or the force of weapons and technology were not enough to impose a solution which no longer could be supported. And there is still another smaller country, a neighbor with the American power--Nicaragua--which did not accept either to be wiped off the map or to be transformed into a dependent province."*

The refusal of nations to accept solutions imposed by force results from awareness of the fact that such solutions harm their free, independent development and attempt to direct their policy in relationship with the interests of foreign circles and to involve them in undesirable political actions which do not answer their vital interests. That is why a real, lasting solution to the major problems today facing mankind requires profound democratization of international relations, active participation of all states and peoples in regulating these problems and in the job of building security and peace.

---

* Giancarlo Pajetta, "The Struggle for Peace in a Changing World, the New Internationalism" in RINASCITA No 13, 1980.

It is remarkable that many scientists and researchers who seek to decipher such complex and contradictory phenomena of our era arrive at a more realistic understanding of the changes and transformations which are taking place in the modern world as well as the requirements resulting for the practice of international relations. For example, the researchers Th. Coulombis and J. Wolfe, subjecting to a critical analysis various theoretical methods for organizing relations among countries, among which is the much praised "balance of power," conclude that this balance "is unsure as well as unstable." [1] Really, establishing relations between states on "the balance" of force which various countries possess is a "solution" which not only is not viable and is dangerous, but also totally contrary to historical realities and the great revolutionary, social and national changes produced in the world. Under the conditions where the ideas of liberty and independence and of democracy and progress are being asserted more and more powerfully, it is more and more difficult to dispute the conclusion that all countries, regardless of their size, material and human potential, social system or partnership in military alliances, are equally entitled to take part in solving the problems of international life. Each nation, large or small, possesses a capacity, its own personality and vocation by virtue of the inalienable sovereignty it has available, to participate together with all the other nations on the basis of full equality of rights with them in solving the great problems today facing mankind.

Those solutions cannot be lasting and effective which are based on taking into consideration the narrow interests of certain states or categories of states which ignore the legitimate interests of the other countries and nations or which seek to reduce international political dialogue to the sphere of those countries which have available a large economic, military or scientific-technical capacity. Criticizing the ways for organizing world relations conceived as a "system of balance" between several large centers of power, political scientist Thomas Perry Thornton correctly observed that such a concept "ignores completely the half of mankind living in the least developed countries. A definition of a world system which excludes or ignores these peoples would be morally nacceptable and shortsighted from a political point of view."[2]

The supreme interests of peace and progress for mankind require not a "balance" of centers of power--a balance inevitably subject to the fluctuations and dependent on the spiraling course of arming--but a realistic, constructive policy of detente and peace, of security and disarmanent, of active and responsible cooperation among all nations, a policy based on the elimination of force and the threatening with force from their mutual relations, on the promotion of new, truly democratic relations of full equality of rights. Only on this basis can the interests of each nation as well as of the international community in its totality be satisfied equitably and can a lasting peace in the world be assured.

1. Theodore A. Coulombis, James H. Wolfe, "Introduction to International Relations, Power and Justice" Prentice Hall, Englewood Cliffs, New Jersey,1978, pp 169-170, 158.

2. Thomas Perry Thornton, "Primus Inter Paras" in "The United States in World Affairs, Leadership, Partnership or Disengagement?", University Press of Virginia, Charlottesville, 1975, p 100.

The organic correlation between the policy of peace and detente and non-interference in the internal affairs of other nations on one hand and the policy of solutions exclusively through peaceful means, bv treaties, for all the litigious problems between states on the other is proven strikingly in all international activity by the broad opening and high principledness promoted by Romania.

In the spirit of the deeply innovative guidelines worked out by the 9th party congress, our party and state have asserted themselves as active promoters of the policy of peace, detente and broad international collaboration, of regulating all litigious problems among states bv peaceful means, of strict respect for the new principles and standards of international relations. Among other things, this has been expressed in the highlv prestigious actions initiated by Romania in the United Nations, other forums or international organs. It is enough for us to mention as an example the Romanian initiative promoted at the last General Assembly session, among which were the following: "Regulating differences among states bv peaceful means," "Development and consolidation of good-neighborliness among states," "Freezing and reducing military budgets," in order to understand the dialectical tie existing in Romania's concept between prohibiting demonstrations of force in international life and promoting new relations of friendship and cooperation, of equality and mutual respect among all peoples of the world.

Carrying out a tireless and brilliant activity at the head of the Romanian party and state, in the 15 years since he has been at the leadership of the nation's destiny, Comrade Nicolae Ceausescu has had a considerable number of contacts and meetings inRomania as well as in other countries with heads of states and governments, leaders of political parties, scientists, personalities in international life, with these meetings resulting in important documents of bilateral collaboration. At the same time, Comrade Nicolae Ceausescu's direct participation in promoting Romanian foreign policy has been carried out in the signing of a very large number of treaties, solemn declarations, statements, joint communiques, agreements of long-term collaboration, which proclaim new principles for relations among states and reasssert our country's firm attachment to these principles and to the cause of the independence and sovereignty of all nations.

Through the contributions of exceptional value made to world political dialogue, Comrade Nicolae Ceausescu has raised the prestige of bilateral and multilateral diplomacy and has given a new, increasingly richer content to these institutions. The direct participation of the Romanian chief of state in numerous meetings with statesmen and political leaders has had an especially positive effect, particularly in the problems connected with the existence of international crises, situations in which the president of our republic alwavs has brought out brilliantly the categoric advantages of solutions negotiated in relationship to the policy of force.

The virtues of hign-level political dialogue and its beneficial effects on relations between states, peoples and nations once again were eloquentlv illustrated by the fruitful results of the recent visit which the president of socialist Romania Comrade Nicolae Ceausescu together with Comrade Elena Ceausescu made in France at the invitation of President Valery Giscard d'Estaing

and Madame Anne-Aymone Giscard d'Estaing, an event of particular significance both at the level of bilateral relations as well as modern international life in general. The new, high-level Romanian-French dialogue, the meetings and talks between the two presidents and the important documents signed on that occasion open broad prospects for deepening the bilateral cooperation between the two countries and for deepening the friendship between the Romanian and the French nations, powerfully demonstrating that countries with different social systems can collaborate closely in all areas in the interest of their peoples and the cause of detente and peace in Europe and throughout the world.

At the same time, President Nicolae Ceausescu's visit to France and the exchange of opinions which took place at that time once again brought out the demand for taking decisive action for the development of relations between states on many levels and for strengthening their collaboration on the basis of strict respect for national independence with a view to solving the complex problems confronting mankind, reducing international tension and continuing and consolidating the policy of detente and peace. As Comrade Nicolae Ceausescu pointed out during his visit, "the present world political context demands most stringently the solution of any conflicts or litigious problems between states only through political treaties, absolutely rejecting the use of force or threatening with force as a means for solving the problems." In this spirit, the Romanian-French Statement, an important political document, expressing the profound concern of the two sides with the deterioration of the climate of international relations, reasserts vigorously "the need for all states to respect the principles of independence and sovereignty, not to resort to force and the threatening with force, noninterference in the states' internal affairs, regulating all conflicts by political means as well as the right of each people to elect freely their path for development, which are at the basis of the policy of detente."

The course of events in the world arena truly showsthat only by strict practical application of all these principles can the normal development of relations between states be assured and can detente and peace throughout the world be consolidated. Along this line, the conclusions brought out during the official Romanian-French meetings and in the documents signed all represent active, broadly-resounding contributions to affirmation of political dialogue, to extending relations between states regardless of their social system, to giving an impetus to the concerted efforts of all countries with a view to strengthening peace and consolidating European and world security and to establishing new, truly democratic international relations.

The problems of the modern world, no matter how controversial and complex they are, can find solutions in all cases by resorting to the method of treaties. As Comrade Nicolae Ceausescu stressed, "Proceeding from the indivisible nature of peace and security in our era, Romania is militating consistently to solve all hotbeds of conflicts and tension which still exist in different places in the world through treaties, through peaceful means." Our country feels that the litigious problems can find real solutions only through treaties, with the basic thing in this direction being to absolutely reject the

use of force and to firmly promote the independence and liberty of each nation and the inalienable right of each nation to develop independently.

In the current international situationmore than ever before, we need the energetic and unified action of all the progressive forces of mankind, of nations everywhere to settle conflicts and to find negotiated solutions to the problems outstanding, eliminating hotbeds of tension and conflict, whose presence seriously affect peace, security, independent development and progress of peoples. It is the firm conviction of our country that in the conflict between right and force, the future necessarily belongs to the right, to new principles of international relations, to the policy of detente, national independence, peace and broad collaboration among all peoples of the world.

CORRUPTION, CRIMES OF PARTY MEMBERS REVEALED

Immoral Doctor Expelled From Party

Bucharest MUNCA DE PARTID in Romanian Aug 80 pp 90-91

[Text] A communist must be honest, sincere, principled and correct, must not tolerate lies and falsehood, must combat attempts to lead him into mistakes before the higher organs and his comrades in work and to shirk responsibilities and duties. These are the basic, fundamental standards of the code of communist ethics and equity which must be mastered, applied and respected by each party member, regardless of the position he holds in society and the jobs entrusted to him. Once again they were invoked at the general meeting of the base organization at Gaesti Unified Hospital, Dimbovita County, which had a single point on the agenda: discussion of the violations committed by Nicolae Deca, physician.

The report presented to the general meeting shows: "He was sentenced twice and hid the fact that he had criminal records when he was accepted into the party." While he was a pupil, together with a colleague, he stole a pendulum clock and a volleyball net from the school accountant's office, an act for which the Ilfov County Tribunal sentenced him to four months' correctional imprisonment. Just several years following this "experience," another tribunal, this time the military one in Constanta, imposed punishment for an even more serious act: concealing the infraction of robbery to the harm of the public wealth--4 years correctional imprisonment and 2 years correctional interdiction, a penalty which was executed. How was it possible for his fraudulent entrance into the party ranks? In the autobiography he compiled, N. Deca "omitted" specifying these times, mentioning brightly that in the period in which he actually was paying his penalty, he allegedly was working as a reader at the Agigea State Agricultural Enterprise. Instead of remaking the film of his life and activity carried out by the person requesting entrance into the party to know him as well as possible, the base organization bureau at the Leordeni Commune Hospital, Arges County, hurried to place his request into discussion, forgetting that one of its basic obligations was to watch that only people deserving of such a great trust from all viewpoints should enter the party. And the base organization bureau had this obligation even more since Dr Deca had been working only 2 years in the hospital and, as a result, little was known of him and his family.

From 1975, when he was accepted into the party, Dr N. Deca's behavior continued to suffer serious "injuries," adding other violations to the ones committed. Thus, he demanded a certain amount of money from a patient who wanted to be placed into retirement at the Gaesti Hospital, where he was transferred in 1977, caught in the act by the state organs.

In his family, too, his behavior deviated, with his simply abandoning his wife and two children. Instead of being concerned with their education, guidance and supervision and struggling to consolidate his family, he maintained extramarital relations, resulting in a child. Actually, he also hid this fact when he was accepted in the party, proving to be just as insincere.

But even faced with so much evidence, N. Deca tried to deny and dispute the truth and not recognize anything of what had been discovered by the party organs. During the individual discussions held by the base organization bureau, he stated that all this was a scenario; full of rage, he encouraged them to openly tell him whether he could work in this unit anymore.

He adopted a rebellious attitude toward the city and county party organs, failing to admit the acts and minimizing the seriousness of the deviations.

These are the reasons for which the general meeting decided to expel N. Deca from the party. An expulsion demanded and imposed by the seriousness of the violations committed and the flagrant contradiction existing between his behavior and the standards of socialist ethics and equity.

Such a dishonest, unsincere and immoral element was able to slip into the party ranks only due to the inadmissible ease and lack of responsibility shown by those called on to examine his activity and to verify beforehand each period of his life with maximum responsibility and exactingness. From here we have the need for conclusions with broader validity and for exercising a solid, multilateral control in order to assure that only those worthy of this high, special honor actually enter into the party.

Wheat Stolen by Guards

Bucharest MUNCA DE PARTID in Romanian Aug 80 pp 91-92

[Text] During the harvesting, when the field smelled intensely of the new bread, as anywhere else in the country, the people in Dabuleni in southern Dolj County were hurrying to gather the rich fruit of the field on time and without losses. Everything was taking place at an alert rate specific to the time. In the village here and there was an old man or a child. It seemed that every job was taking place in the most perfect order. And that is how it would have been if...

If some individuals with base and dishonest concerns, looking for money, had not profited from the fact that the people were absorbed in their work from morning to night so that they could thrust heir hands, up to their elbows, in the public granary. Who were they?Machine operators Marin Onicala, head of the mechanization section Gheorghe Trifu and watchman Constantin Vasile and engineers Nicolae Pantu and Vasile Dumitru, heads of the farm at the

Dabuleni State Agricultural Enterprise. Yes, yes, there is no mistake, Pantu and Dumitru are engineers! They, men invested with the responsibility of leadership work and, implicitly, the duty to take action to defend the public wealth, methodically planned to commit the action and participated in it. They got hold of 3,600 kg of wheat and 700 kg of barley and, in order to erase any kind of track, they thought, they took it on the backroads, through forests and field roads, and took the grain directly to the mill in Bucinisu, in the neighboring county of Olt. They ground it but when they were about "to place the sacks in the cart,"they had to pay for their act.

This case, qualified and judged as being theft of public wealth, requires a deeper examination of the factors which favored the production of it. For example, the party leadership recommended that both the combines' activity as well as the transport of the grain from the field to the storage be carried out in groups and under permanent control of delegates established by the commune party committee and people's councils. Also, it was requested that each kilogram from the production obtained be weighed and written in the records and that the road of the grain from the field to the granary be as short as possible and without losses. As it seems, in Dabuleni these specifications were totally not taken into account by the commune party committee, which means a lack of responsibility and indiscipline.

True, the grain robbers were judged in a public trial but those who were party members were expelled from the organization but, in order to learn the maximum lessons, the county party committee has the duty of placing this unusual case into discussion by the aktiv and to adopt firm and preventive measures.

Cultural Official's Religious Activities

Bucharest MUNCA DE PARTID in Romanian Aug 80 pp 92-93

[Text] 29 June 1980. On that day, those serving schools throughout the country celebrated the traditional "Teacher's Day," a sign of the value given by our party and state to the striving of those who light the start of the road of life for the entire generations of schoolchildren.

Unfortunately, there also were some regrettable exceptions. In Ciortesti Commune, Iasi County, for example, Prof Ion Mircescu, director of the commune's culture house--who naturally should have been the spark for educational actions that day--had other concerns which were totally alien to the special importance of that day and caused him , through his social position, as well as other teaching cadres to proceed similarly. As best man for the wedding of instructor Elena Cracuta (a UTC member), he addressed some colleagues with an invitation to take part in celebrating the religious wedding of the above-named person at the church in Coropceni's church.

Correctly, the teaching cadres who did not accept to be wedding guests at a church pagaent, other residents of the village and pupils wondered how the director of the culture house, a party member invested with the high responsibility of organizing the cultural-scientific activity in the commune mentioned, could abdicate from the written and unwritten standards of his mission with

his heading a religious ceremony and then at the head of a table with gifts (the 70,000 lei collected at this time uncovering him as a businessman), actions clearly in contrast to the principles and philosophical prinvictions which he actually had the duty not only to propagate but also to respect.

Of course, an explanation of the fact exists, with Ion Mircescu's moral profile also being shadowed by other negative demonstrations. In the 1978-1979 school year, while he was director of the commune school, the county school inspector penalized him for flagrant violation of some of the standards in the Statute of Teaching Cadres (among which was receipt of some amounts of money outside the rights established), recommending that the local party and state organs change him from his job as director. The best thing the comrades from the CiortestCommune leadership thought to do was to name him director of the culture house. The appointment was accepted easily by the county party committee and nobody asked whether a man removed from the job of school director for moral violations is the most appropriate person to be concerned with the cultural-scientific education of the commune residents.

The Iasi County Party Committee has the duty of carefully examining the existing situation in Ciortesti, effectively helping the party and state commune organs to apply the party's moral standards steadfastly and controlling how the basic duties are carried out by those cadres who have duties in the area of developing the socialist awareness of the people--duties which, as we know, are incompatible with the concessions made to mysticism and religious practices.

'Fictitious' Workers in Sibiu Plant

Bucharest MUNCA DE PARTID in Romanian Aug 80 p 93

[Text] The Metalurgica Enterprise is one of the economic units in the Municipality of Sibiu which for years has constantly obtained remarkable achievements for all plan indicators. The opinions this collective enjoys, however, are shadowed by some practices which flagrantly go against the legal standards in such an important area as the one of the full use of the labor force. Without any right, the enterprise's director, Comrade Alexandru Bucur, ordered that the female workers in the sections clocked in as working in the locksmith or welders should be brought to do various office jobs.

On several payrolls checked at random, Maria Mosca, for example, figures in position 23 as a worker in the formation of foreman Martin Roth from the metallic construction section, with all the hours worked. Actually, she "helped type acts in the office for supply, sales and transport or as a computer center operator," according to what Comrade Alexandru Bucur said. Also, Doina Muntean merely is called worker in the formation of Victor Botezan in the metallic construction sector 1, while she has been working for months as a telephone operator. And these kinds of examples could continue.

There also is at this enterprise another category of fictional worker but, however, not with pay. Of course, we are referring to the soccer players. For example, Gheorghe Vulcu, Anton Covaci, Karl Schneider, Ion Coman are employed as locksmiths, I. Jedele as electrician, I. Popa as foreman, Francisc Kurty as technician for technical quality control, while the trainer Liviu Coman as locksmith for section I and so forth. They are seen extremely rarely at the workbench.

It is surprising that this situation, known by the enterprise's party committee, has not brought a combative attitude, especially since the people in production repeatedly have shown their dissatisfaction anddisapproval.

Upon notification by the editors, the secretary of the Sibiu Municipal Party Committee analyzed all these aspects at one of his meetings, at the same time establishing the political and organizational measures intended to assure reestablishment of all activity at the enterprise mentioned on legal bases, introduction of the necessary order in the organization of work so that each member of this collective is employed according to his training and paid in proportion to the work he provides.

NEED FOR INCREASING, IMPROVING WORKER CANTEENS

Bucharest MUNCA DE PARTID in Romanian Aug 80 pp 56-58

[Article by Maria Dutescu, deputy chairman of the Council for Social Problems and Raising the Standard of Living of the Central Council of the General Union of Trade Unions of Romania]

[Text] A special spot in the enterprises' social activities is held by the canteens and buffets, created with the purpose of providing the workers with rational food. Both the trade union organs and organizations are concerned with their good operation, regulated by Law 9/1971 and they, under the leadership of the party organs and organizations, are called on to guide, aid and regularly check on the activity of the canteens, provide them with all necessary goods on time, prepare diversified meals which are of good quality and at the lowest possible cost price.

Understanding that rational food during the working program--as a means for maintaining and strengthening the workers' state of health and raising output in work--is inconceivable without canteens' aid, the trade union organs have increased their concern for their good organization and operation. On the basis of the experience accumulated, they intervene effectively to develop the activity of the canteens, with attention primarily being directed toward creating all the possibilities for serving a hot meal to the greatest possible number of workers.

A first step they made was to establish a meal break during the working program so that it in no way affects the good development of the production process. At the same time, opportunities were found so that the break for meals by sections and jobs be spread out over different hours in order to avoid crowding. In most places, serving of the meal during the working program--thus, in 15-20 minutes--has necessitated, however, creating a network of microcanteens at the main jobs, with the number of these meal service units rising to nearly 3,000. In this direction, the committees of the trade unions and people's councils in the big units, such as the Hunedoara Iron and Steel Combine, the Brasov truck enterprises, Electrotimis in Timisoara, 1 May in Ploiesti, Electroputere in Craiova and others, have obtained some of the best results in extending microcanteens so that they now cover the requirements at the level of the plants and sections and all sectors and places of work.

Of course, the existence only of these conditions does not also mean a rush of workers at the canteens and microcanteens, this being determined by the quantity, diversity and price of the meal. That is why the Central Council of the General Unions of Trade Unions of Romania, the committees of the unions of trade unions by branches, the territorial organs and trade union committees have been concerned more closely with the leadership committees of the canteens, aiding them in developing a managerial spirit. They have proceeded from a priority approach to provision in solving these aspects of the problem.

The great majority of city, municipal and county councils of the trade unions have organized controls at the canteens for the stage of provisions, particularly for the winter period, resolving the problems occurring together with the commercial organs. Also for this purpose working meetings have been organized with the leaders of the supplier commercial enterprises, which have an understanding to contribute to the good provision of the canteens for the winter of 1979-1980.

The trade union organs have given greater attention to increasing the quantities of food preparations and other products which would be offered to workers in the more than 2,300 buffets and stands, giving them the incentive to create the conditions needed for this activity, that is, setting up adequate space. Along with the fact that they present the workers with good-quality, fresh and low-cost products, they at the same time, in another way, come to the advantage of the workers, since the profits obtained are used to improve the meal served to the subscribers.

Under the leadership of the party organs and organizations, the trade unions also utilize another important source for improving the meals at the canteens and reducing their price, being concerned with the development of the annex farms. In recent years this activity, however, was hampered by certain mentalities, according to which it was easier to buy meat than to produce it. So there was not a great development of their own hog-raising complexes and only 662 existed at the end of 1979 with 22,800 animals, which means that more than 1,000 canteens did not have such resources available.

In order to eliminate these shortcomings, at the directive of the party leadership and Comrade Nicolae Ceausescu personally, a program to raise around 240,000 hogs and 1 million chickens has been drawn up and is being implemented at all the canteens and canteen-restaurants which operate in the big units and the big industrial platforms. This action, intended to utilize the resources existing for the purpose of improving the food and reducing the cost of it at the same time is seeking that, as it unfolds, it also lead to a reduction in the distribution of meat from the state central stock, thus relieving the large quantities used in the collective consumption. It is clear that in implementing this program the trade unions are being called on to become involved with all their capacity, along with the collective leaderships of the enterprises. Thus, in Bihor, Bistrita-Nasaud, Constanta, Galati and Neamt counties, where the trade union committees, in close cooperation with the workers councils and under the leadership of the party organizations,

have taken all measures to rapidly set up farms with simple, cheap resources at the big canteens or canteen-restaurants, even now they have succeeded in reaching--and in some places exceeding--the figures forecast for populating them with animals. For poultry, however, only three counties--Bihor, Hunedoara and Vilcea--have reached the figures from the program.

If the action is taking place slowly in some counties, such as Ialomita, Cluj, Bacau, Arad, Maramures, Sibiu, Teleorman and the Municipality of Bucharest, it means that the aid given by the trade unions is still poor, and their territorial organs have the duty to take measures to bring them to contribute with all their forces to its good success. This same job also must be done by the county, municipal and city councils of trade unions in Maramures, Vaslui, Covasna, Vilcea, Harghita, Sibiu and Satu Mare, where little land has been taken from the areas identified as canteens and other collective consumption units to cultivate them with vegetables. Here, too, as in the area of hog- and poultry-raising, the trade unions must take energetic action to cultivate each square meter of land with the industrial and agricultural enterprises with vegetables for the purpose of obtaining as large quantities of meat and vegetables as possible for current consumption and for the fall-winter provisions.

It is necessary to a greater extent for the territorial organs to intensify their guidance and control so that the trade unions can fully make their contribution to the success of this important action.

A gratifying indicator of the concern with the good operation of the canteen in the end is the number of subscribers in proportion to total personnel. One may evaluate it as possitive that last year in counties like Ialomita, Dimbovita, Constanta, Gorj, Maramures and so forth, an increase in subscribers was registered, with the percentage of them in total employed personnel being much above the countrywide average.

The leadership committees of the canteens play an important role in obtaining these results; with the differentiated and regular aid of our trade unions, they are asserting themselves as active organs with initiative and responsibility for the quality and way the workers are served hot meals. These kinds of leadership committees of the canteens with appreciable activity are working at the Electrobanat Enterprise in Timisoara, Dimbovita in Bucharest, the Brasov Truck Enterprise and so forth, where the number of subscribers exceeds 30 percent of total worker personnel, serving them an appropriate meal at prices below 5 lei or even below 3 lei, (including dessert), as is the case at the canteen for the Dimbovita Enterprise in Bucharest. The method of periodic analysis has been made permanent in the current practice of these trade unions; these analyses of the canteens' activity take place in committee plenums or bureau meetings. Following the resultant conclusions, effective decisions are adopted regarding the operative and concrete aid for the canteens and their leadership committees. At the same time, the presidents of the trade union committees, vice chairmen of the workers councils propose measures to these leadership organs which are intended to lead to an improvement in the canteens' activity. There are many trade union committees and, primarily, we

are referring to those in the PloiestiChemical Equipment Enterprise, Progresul Enterprise in Braila, the Bucharest Heavy Machinery Enterprise, the Brasov Tractor Enterprise, which through their members which are specifically assigned regularly seek to have good operation for the canteens and application of their own decisions.

The committees of the trade union unions by branches, the city, municipal and county councils of the trade unions use the method of organizing operational working meetings where problems referring to raising the trade unions' contribution to the good management of the canteens are discussed and to which both presidents and members of the trade union committees, committees of leadership of the canteens, canteen heads as well as leaders of the commercial enterprises are called. The findings, conclusions and proposals made in this framework by the workers control teams have proven effective.

In the current practice of the territorial trade union organs the initiation of exchanges of experience also have entered into current practice, an occasion on which representatives of the host canteen present their own activity, achievements, methods used by the leadership committee as well as the way in which relations are structured with the unit's leaders, with the commercial enterprises and so forth. Generally, also taking place on such occasions is a visit to the canteen and its annexes. Despite the fact that working conditions differ from canteen to canteen depending on the specific nature, each participant draws many conclusions which are useful for his own activity so that this method of aiding the canteens used by the trade unions also meets with the interest of those working in these units in order to obtain better results. Such exchanges of experience which are particularly useful recently were organized by trade union councils in sectors 4 and 5 in Bucharest, the trade union county councils in Arges, Braila, Hunedoara and others.

In more and more cases, the material presented to the meetings and the exchanges of experience are being accompanied by films or slides which catch certain positive or negative aspects "live" in the operation of the canteens.

A new, stimulating element added in recent years to the ones intended to lead to the improvement in the activity of the units which serve hot meals to the workers in the enterprises and institutions is the annual contest organized by the Central Council of the General Union of Trade Unions of Romania for the title "canteen with the best results." This form of competition carried out on the countrywide level and which has included all of the more than 2,000 canteens, seeks through the criteria at its base, primarily, to raise the quality and diversification of the menus, to provide accessible prices, appropriate sanitary conditions, good management. At the same time, the contest aims at raising concern of the trade unions and leadership committees of the canteens with establishing and developing the microcanteen network both in the sections and workshops as well as in the dormitories for singles. The discussions organized at the county and national level with the occasion of concluding each competition period within the contest, an occasion upon which not only a review is made of the results obtained but also a broad analysis of the canteens' activity, can mobilize the trade unions to even more efficient work.

Being aware of important responsibility belonging to them to provide hot meals for workers on time and of good quality, the trade union organs and organizations will intensify their actions to guide and aid the canteen committees as well as the regular checking of the method of operation of these food units, steady provision with the necessary goods, improvement and diversification of menus and strict respect for the hygienic-health rules.

At the same time, the trade unions will increase their concern with the development of the annex farms for raising hogs and poultry, with cultivating each portion of productive land within the units and generalizing the positive experience gained by the leading canteens so that the canteens can justify fully their name as base sections of the erterprises.

IRON GUARD, ANTONESCU PERIOD RECALLED

Bucharest ERA SOCIALISTA in Romanian No 17, 5 Sep 80 pp 36-39

/Article by Dr Ion Spalatelu: "One of the Darkest Times in the History of Romania"/

/Text/ Over their multimillennial history, the Romanian people have had--not infrequently--to overcome countless perils and pass through many hard times and tragic events. Among them there was inscribed with black letters, of sad memory, the establishment of the military-fascist dictatorship.

An event with consequences of the worst sort for Romania, the Legionary-Antonescu dictatorship represented the most terrible debauchery of reaction, terror and violence on a mass scale, looting and embezzlement of the country's riches, savage repression of all the democratic, patriotic forces and, especially, of the working masses, the communists and the antifascists. The seizure of state power by the Legionaries--agents of Hitlerism in Romania--inaugurated a profoundly antinational political course, which had among other tragic results the criminal betrayal of the homeland's vital interests, the enslavement of the country by fascist Germany. There was then borne out in all respects the warning of the Romanian Communist Party, which, firmly attached to the basic interests of the whole populace, had discerned with a patriotic sense the course of events, stating clearly that "the establishment of a military-fascist dictatorship in Romania would mean a bloody, terrorist dictatorship of the leaders of the capitalists and big landowners against the workers, the peasantry and the oppressed nationalities, the abolition of all the parties, the persecution of all the progressive intellectual elements, the banning of any free expression of thought, unlimited reaction and the throwing of Romania into a state of savagery and barbarity."

Alarmed by the fate that fascism and the Legionaries were preparing for the people, for the whole country, the RCP acted consistently to unite around the working class--the most advanced part of Romanian society--the widest progressive national forces in the struggle for democracy, national sovereignty and independence. In the interwar period, precisely this wall of

firm opposition and growing resistance of the masses of people to the rightwing and extreme rightwing currents inhibited fascism's rise to power in Romania, the attempts by Hitler's Germany to subjugate it. The determined antifascism of the Romanian people caused Romania to be numbered among the last European countries in which fascism came to power and then only in the presence and under the protection of Hitler's troops.

The establishment of the military-fascist dictatorship in Romania became possible under the extremely complex external conditions of the rise of fascism on an international level, of the aggravation of the revanchist policy of dictation and cynical violation of the principles of international law, of disruption and enslavement of the peoples. The seizure of the power in the state by the dictatorial and fascist regimes in a number of countries led to the continual aggravation of the international situation in the interwar period, to the activation of the revanchist, revisionist territorial policy of a direct attack on the peace and security of the peoples.

Right at the end of the third decade and the start of the next one, the irresponsible acts of encouragement and support for the actions of Hitler's Germany by some imperialist powers became more and more numerous. In 1935, with their complicity, Hitler's Germany obtained "the right to equalize" its military potential with that of the great powers, an event that caused it to denounce the Treaty of Versailles and to turn to open and massive armament. On 7 April 1935, the foreign minister of the Third Reich, Konstantin von Neurath, expressed with alarming arrogance "the necessity of revising the borders of the East so that the voice of the small states is no longer heard."

The fascist states'--especially Hitler's Germany's--policy of arbitrary territorial revisions, of flagrant violation and disregard of the system of treaties after World War I, was also aimed directly at the unity and integrity of the Romanian national state. This is why Romania, through the eminent statesman and diplomat Nicolae Titulescu, acted to strengthen the Little Entente, formed of Romania, Yugoslavia and Czechoslovakia, as well as the Balkan Pact, which included Romania, Yugoslavia, Greece and Turkey. In June 1934, our country established diplomatic relations with the Soviet Union. At the same time, the traditional ties with France and England were cultivated and strengthened. All these actions were meant to protect Romania from Hitler's aggression, there being possessed the support of the Romanian Communist Party, of all the democratic and progressive national forces.

The imperialist policy of world domination and redivision promoted by Hitler's Germany, fascist Italy and militaristic Japan registered a succession of encroachments and acts of expansion, leading to the outbreak of World War II, which caused mankind incalculable losses of material and spiritual assets, over 50 million people--men and women, youngsters and adults--in all corners of the globe. Subordinating to it the majority of the European

countries and establishing Hitler's "new order," Germany turned practically to the savage looting of their riches, to the extermination of their population through deportation and the internment of millions of citizens in the death camps. The steamroller of fascism passed destructively over more and more countries and peoples.

Through its key strategic position in the southeast of the European continent, through the fact that it was a big producer of petroleum and one of the richest countries in agricultural and food products, having at the same time a geographical location favorable to Hitler's anti-Soviet aggression, Romania occupied a special, separate place in Nazi Germany's plans of expansion and invasion. All these considerations caused the Hitlerian circles to devise and undertake at an early time many actions for subjugating Romania to the interests of the Third Reich.

As is known, at the start of the fourth decade, the ultrareactionary leaders of the Romanian bourgeoisie and landowners, exhibiting tendencies to eliminate bourgeois democracy, to limit civil rights and liberties, turned openly to encouragement and support for the most diverse actions of the fascist elements. The creation of the fascist Iron Guard organization as early as March 1930—with the direct support of the Hitlerian circles--and its actions for affirmation in the country's political life had consequences of the most serious sort for the Romanian people. "The creation of the fascist-type terrorist Iron Guard organization and its imposition on the country's political life constitute," Comrade Nicolae Ceausescu points out, "the most characteristic phenomenon of the ultrareactionary tendencies promoted by the circles of the Romanian oligarchy. The Legionary movement, the agency of Hitlerism in Romania, wholly subservient to German imperialism, conducted a profoundly antinational policy, gravely prejudicing the interests of the Romanian people. In collusion with the representatives of the monopolistic bourgeoisie, it betrayed the people's interests, subordinated the country to the domination of Hitler's Germany, endangering the very existence of Romania as an independent and sovereign state."

Both the existence and the practices of the Iron Guard always had their roots in a soil foreign to Romanian soil. Right from its appearance, the Legionary movement, that is, the Iron Guard, was used by the Nazi circles in actions of espionage, sabotage and subversion in Romania. In 1932, the Legionaries had close ties with the Hitlerian elements in Romania grouped together in the "Volksgemeinschaft" organization, controlled directly from Berlin. From the outset, many of the Guardists entered the employ of Hitler's "special" services. Shortly after taking power, Nazi leaders Alfred Rosenberg, Rudolf Hess, Heinrich Himmler and Reinhard Heydrich drew up a detailed plan for carrying out pro-Hitler activity in Romania.

The main way used to stimulate the Iron Guard to betray the national interests consisted of the subsidization of it with large sums of money by Hitler's government and the Nazi Party. In just a single year, 1935, the Hitlerian activity abroad cost 295 million marks--a fact recorded in

documents--with Romania being fourth in order on the list of the Gestapo's concerns. Many concrete facts illustrate the system of subsidizing the Legionary movement. The newspaper of scandal and hooligan abuse, PORUNCA VREMII, of a fascist orientation, was subsidized with German capital through the espionage agency within the "Soia" society. The Legionary publication SFARMA PIATRA received money directly from the German legation in Bucharest. In an investigation made by the security forces, in July 1938, several files with receipts were found in the offices of representatives in Bucharest of the well-known German firm "I. G. Farbenindustrie," it following from them that the Guardists had received over 4 million lei in the course of just a few months. This "aid" became extremely substantial on the even of important events (elections, festivals and so on). The Legionaries with important positions in the Guard, who furnished direct services to the Reich, were remunerated on separate payrolls, which were kept in the archives.

At the same time, some representatives of the Romanian political and ruling circles, involved in the affairs with Hitler's Germany, came more and more to the assistance of the fascist groups within. Big financiers and political figures also known for their reactionism supported morally, but especially materially, the rise of fascism in Romania. By concluding the "non-aggression pact" with the Iron Guard during the election campaign for the parliamentary elections in December 1937, Iuliu Maniu (PNT [National Peasant Party]) and Gh. Bratianu (PNL [National Liberal Party]), leaders of so-called "historical parties," offered it the political endorsement needed for it to appear to be "a national political formation." Moreover, a number of ultrareactionary elements among the bourgeoisie and landowners, "failures of our public life," as the newspaper LUMEA NOUA of 26 February 1936 judged them, joined the Legionary movement. Among them were Gen Gh. Cantacuzino-Granicerul, a big landowner and industrialist, becoming in the 1935-1938 period the head of the Iron Guard, disguised as the "All for the Homeland" party; "Prince" Al. Cantacuzino, "Princess" Zoe Studrza and so on.

In their evil actions, the Legionaries found basic support for themselves in the "ideas" of reactionary authors like A. C. Cuza, N. C. Paulescu and N. Crainic and of "theoreticians" of fascism like N. Ionescu, Tr. Braileanu and M. Manoilescu and, above all, in the Nazi ideology in Adolf Hitler's "Mein Kampf" and Alfred Rosenberg's "The Myth of the 20th Century." From all of them the Guardists scraped together a conglomerate of confused and contradictory views in praise of force and death, views imbued with primitivism, obscurantism, irrationalism, racism, anti-Semitism, anticommunism and so on. Supplemented with a bombastic, jingoistic and demagogic phraseology, all of them served as a screen for the activity of subordinating the country to Hitlerism and the establishment of a terrorist regime.

Despite the extraordinary material support provided by external and internal reaction, the Iron Guard never managed to assert itself as a mass political group but always remained a foreign body on Romanian soil, isolated

and hated by the people. In it there were gathered elements from the periphery of society--soldiers of fortune, assassins, declasses from the petite bourgeoisie and lumpen proletariat, individuals with sadistic instinctual impulses, who bore in them dissatisfaction with humanity in its entirety, with the democratic norms of life. "It would seem," Legionary I. Mota wrote in black and white, "that I and my comrades are some sort of strange beings with two lives, some sort of ghosts raised from a dead world to bear the spirit of terror in the world of today. We are just that.... The cruel reign of the ghosts is approaching!"

From the very outset, the Romanian Communist Party discerned the immense danger that hovered over Romania on the part of external and internal fascism, drawing into the struggle against it all the democratic and antifascist social and political forces. The danger that threatened us was great--the RCP pointed out--but our determination for unity and struggle had to be even greater. "We communists," it said in the resolution of the RCP Central Committee in October 1935, "are ready to defend Romania's independence with weapon in hand if our country should be compelled to wage a national war of defense against fascist imperialism." Clearly distinguishing the extremely grave danger from Hitler's Germany, the RCP Central Committee warned, through the decision of its plenum in July 1936, that "the triumph of Hitlerism leads to the dismemberment of Romania...."

The patriotic appeals of the communists found a resounding response among the broad working masses. The heroic struggles of the railroad and oil workers in 1933, the unbroken string of labor strikes in all those years of the tumultuous fourth decade, held both in Bucharest and in other localities throughout the country in 1936 and 1937, the great antifascist demonstration on 1 May 1939, one of the strongest demonstrations in Europe against Hitlerism on the offensive, and the impressive patriotic demonstrations and meetings during which the determination of the broad masses in Romania to block the path of fascism was expressed more and more strongly are vivid testimony in this regard.

Important actions for rallying the democratic forces in Romania on a common platform were performed successfully under the guidance of the communists: the concluding of the agreements on anti-Hitler struggle on 24 September 1935 in Bacia (Hunedoara) between the Plowmen's Front and MADOSZ (the Union of Hungarian Working People in Romania) and on 26 November 1935 in Bucharest between the Democratic Bloc and the Socialist Party (Poporici). At the start of December 1935, in Deva, representatives of the communists, the socialists and the peasantry organized into the Plowmen's Front, of the Hungarian working people (MADOSZ), of the citizens belonging to the Democratic Bloc and of other political organizations and groups signed in Tebea, under Horea's Oak, the agreement on the Antifascist Popular Front, initiated by the Communist Party. A number of local organizations and members of the Social Democratic Party, the Socialist Unity Party, the Radical Peasant Party, the Conservative Party (G. Filipescu) and local organizations of the National Peasant Party and the National Liberal Party rallied

to the united front of antifascist struggle initiated by the Romanian Communist Party, a fact that demonstrated the existence of a strong antifascist state of mind among the Romanian people.

Under these external and internal conditions, especially after the imperialist Munich agreement in September 1938, which led to the dismemberment of Czechoslovakia, giving at the same time to Germany a free hand to subjugate the countries in southern and eastern Europe, its pressures on Romania were also intensified. The Romanian-German economic agreement in 1939, followed by other onerous treaties, put Romania's economic and political life more and more under the control of Nazi Germany. The German Reich and fascist Italy imposed in August 1940 the odious Vienna Diktat, by means of which the northern part of Transylvania, an old Romanian territory, with the Romanian population in the majority, was stolen and given to Nazi Germany's ally, Horthy's Hungary. In those hard times, Romania stood alone before Hitler's policy of force, terror and dictation, without any outside help, abandoned by all the powers of Europe.

Hitler's Germany was interested to a high degree in totally subordinating Romania to it by establishing at its helm a fascist government that would completely meet its needs. This objective was facilitated by the internal political situation created in Romania as a result of the ruling circles' policy of continually yielding before Hitler's pressures and the offensive of the internal fascist groups.

At the start of September 1940, things were aggravated even more as a result of the territorial cessions, which raised from one end of the country to the other a strong wave of rage and indignation on the part of the masses, of the whole populace. The war of the forces of fascism against the world could not detour around Romania's borders for very long. The royal dictatorship, disgraced and without authority, could no longer cope with the situation, yielding more and more to the pressures of Hitler's Germany. Carol's bankrupt policy and the total discrediting of the "historical" parties led to the creation of an extremely grave political crisis. In the given situation, in order to protect himself and be able to save his throne, King Carol II oriented himself toward the solution of instituting an ironhanded government.

The most suitable man was Gen Ion Antonescu. He had been connected with the Iron Guard for years and years, a reason why the Nazi circles approved of him. He had distinguished himself by means of the bloody decisions made during the repression of the insurgents in the Galati area in 1907 (for the blood spilled then and for the color of his hair, he was also called "the Red Dog"). It was then understandable that the Hitlerites, being aware of the inability of the Legionaries to run the country, were to prefer a general known for his fascist extremist views and actions.

The Legionaries launched a campaign of support on his behalf by means of disturbances instigated in Bucharest and in the country. On 4 September

1940, Antonescu received the official mandate for forming the government, and on 5 September, King Carol II signed the decrees by means of which he suspended the constitution, dissolved the parliament and entrusted to the general the leadership of the government with dictatorial powers. On 6 September 1940, Carol abdicated in favor of his son, Mihai, fleeing the country a second time. A government in which the majority of the ministers were Legionaries was then formed. On the date of 16 September 1940, Romania was proclaimed "a national Legionary state."

The darkest page in Romania's history then began. The military-Antonescu regime--an expression of the alliance between the military group around Ion Antonescu and the Iron Guard--represented the dictatorship of the most reactionary and chauvinistic circles of the ruling classes. The bloody repression and the suppression of the opponents became the main method of affirmation and maintenance of the Legionaries in state life. Terrorism was raised to the rank of a state policy. The police and the security forces, the main factors in the apparatus of repression, were taken over by the Guardists. Moreover, the whole Iron Guard was transformed, on the model of the Nazi formations, into an armed paramilitary organization, which unleashed a huge wave of assaults and assassinations.

The bloody path of the existence of Legionarism, marked by many crimes--the murder of Prime Ministers I. G. Duca and Armand Calinescu in 1933 and 1939--registered during the Legionary government countless other victims from all the social and political categories, people who acted for democracy, for culture and progress, for the safeguarding of Romania's national interests.

Shortly after the establishment of the Legionary-Antonescu dictatorship, in November 1940, called with good reason "the bloody month," "the month of crime," "the month of criminal vengeance," the gun became the only "argument," the only "language" in the communication of the Legionaries with the people. Documents of the time recorded in the first days of the Legionary government acts of terrible tragedy: "The people are taken to the Legionary headquarters and maltreated horribly...," it being noted that only "in the Middle Ages were such means of violence used!" The Legionaries aimed their blade particularly at the communists, at all the antifascist, patriotic political organizations and personalities, at the intellectuals and the officers who spoke out and acted firmly for the reestablishment of Romania's sovereignty and against the domination of Hitler's Germany.

On the night of 26-27 November, in the Jilava prison, a group of Legionaries, led by Dimitrie Grozea, slaughtered over 60 former high officials, among whom were General Argesanu, former prime minister, Victor Iamandi, former minister of justice, judges, officers and other civil servants. "I was assigned," Legionary assassin Gh. Cretu said, "to cell 18. The signal was heard at 0030 hours. I opened the door of the cell. I ordered, 'Attention!', after which I fired, executing by shooting all 14 detainees who were inside.... The execution took approximately 10 minutes."

But the thirst for blood was not satisfied. After an hour, on the same night, in the lockups of the police station in the capital, six more persons were killed, their corpses being thrown into the Baneasa forest.

The murder of world-famous Romanian scholar Nicolae Iorga, former prime minister, of Univ Prof Virgil Madgearu and of other noted personalities belonged to the same chain of assassinations. Constantin David, a member of the RCP Central Committee, Ocsko Tereza and countless other militants of the working class were assassinated in a bestial manner.

The Legionaries considered the assassinations in the first months of their government just the start of a vast plan of criminal, terrorist actions. "We want these people," Legionary leader Vasile Posteuca wrote on 2 December 1940 in the newspaper CUVINTUL, "to feel, if they do not feel, to waste away, to die by the thousands.... We too (the Legionaries--our note) want to see these people trembling, wailing..., facing death and dying.... Understand, Romanian people, and submit."

No matter how incredible such words may seem today, they are real. The Iron Guard acted madly, trying to transform Romania into a veritable death camp.

The apogee in this regard was attained during the Legionary revolt on 21-23 January 1941, when Antonescu and the Legionaries bloodily got even not only with each other but also with the people. The huge wave of monstrous crimes attained then a dreadful degree of violence and ferocity. In Bucharest, scores and scores of bodies of those killed were hanged by the neck on hooks in the slaughterhouse used by butchers. In various places in the capital, the lone soldiers caught unawares by the Legionaries were doused with gasoline and burned alive. Over 490 dead and wounded, Romanians, Jews and other nationalities--this was the tragic balance sheet of that day of total and bloody debauchery on the part of Legionarism.

Concomitant with the Legionary death squads, other squads of the Iron Guard roamed through villages and cities, in columns of stolen cars, pouncing everywhere and breaking shutters and shop windows with picks and crowbars and looting thousands of stores, private houses, public buildings, appropriating enormous quantities of material goods, sums of money, valuables of all sorts. This was the concrete affirmation of what the Iron Guard had proclaimed far and wide for a long time, that the Legionaries "are not the enemies of the bourgeoisie but, on the contrary, the protectors of it and founders of a new bourgeoisie conscious of its role in the Legionary state," as Traian Braileanu, the Gardist minister of education, said in the newspaper CUVINTUL of 3 November 1940.

The robberies, the thefts, the abuses committed by the Legionary gangs put on easy street, almost totally disorganized the economy in the months of the Legionary-Antonescu government.

The Legionary-Antonescu government turned to massive layoffs of workers and functionaries, especially among those who were not members of the Guard, to the terrorization of intellectuals of a democratic persuasion, including Mihail Sadoveanu, Tudor Vianu, Ion Marin Sadoveanu, Florin Stefanescu Goanga and many others. At the same time, many communists, social democrats, bourgeois politicians, citizens hostile to the fascist dictatorship were interned in concentration camps. Thus, as the RCP noted in the documents "De la Regimul Legionar la Dictatura Militara" /From the Legionary Regime to the Military Dictatorship/, the Legionary regime "collapsed in disgrace, blood, fire and robbery." Shortly after seizing power, the Legionary-Antonescu dictatorship opened the country's borders to the troops of Nazi Germany. In the October 1940-January 1941 period, over 170,000 of Hitler's military personnel entered Romania. In the October 1940-August 1944 period, the expenses imposed on the Romanian state for maintaining Hitler's military mission reached the figure of over 67 billion lei (in valuta of 1938). At the same time, the fascist government entered into the tripartite pact, thus including Romania in the political-military bloc of the states under the hegemony of Nazi Germany.

The removal of the Legionaries from power, in January 1941, done against the background of the general anti-Legionary state of mind of the working masses, led to an even more precise understanding of the political orientation and collaboration between General--later Marshal--Antonescu and Hitler's Germany. At the same time, the Nazis took under their protection the Legionary leaders who had fallen out with Antonescu in order to preserve them and use them when necessary as a reserve crew and a group for espionage and sabotage. In his turn, Gen I. Antonescu, after the revolt, through "An Appeal to the People" in which he scolded "my dear children, whose faults I have shouldered for 5 months," gave assurances that he was going to prepare "the great political system of the state. From the Legionary spirit I will create an order suited to the new feeling that has settled upon the world in a community with Germany and Italy...."

Antonescu's military-fascist regime fully justified the expectations of the Hitlerites, who brought him to and kept him in power. Under the conditions of the total suppression of the people's liberties, of the more and more marked infeudation to Nazi Germany, Romania was thrown, against its will, into Hitler's anti-Soviet war, a war hated from the bottom of the heart by the whole Romanian populace.

The Romanian people always viewed the Legionaries with hatred and loathing, as a group foreign to their aspirations and interests, to their mental and moral makeup, to their democratic and humanistic, patriotic and internationalistic traditions. Under the conditions of those years of sad memory, the RCP took the antifascist and anti-Hitler struggle to new heights, united closely all the progressive, antifascist, democratic forces around it in a wide resistance movement, under the motto "To the Revolutionary Struggle for the Overthrow of the Military-Fascist Dictatorship." The people's antifascist state of mind constituted the basis of the Communist Party's

decisive actions in the struggle against the Antonescu dictatorship and for the country's liberation from fascist domination and the country's removal from Hitler's war and its entrance into the antifascist coalition.

Responding to the party's fiery call to the struggle for the total annihilation of fascism, the Romanian people launched the antifascist and anti-imperialist revolution for national and social liberation. The triumph of the armed insurrection in that heroic August 1944, a work of the wide patriotic forces united around the RCP, represented a deathblow for fascism. As Comrade Nicolae Ceausescu stated, "The memorable act on 23 August 1944 opened for the Romanian people the way to the gaining of social freedom, to the achievement of the highest aspirations of those who work, to the victory of the socialist revolution and the transition to the construction of the new order. Under the leadership of the Communist Party, the fearless standard bearer of the national interests, Romania has eliminated forever the yoke of imperialist domination, has gained its full state independence. The Romanian people, taking their fate into their own hands, are freely and independently forging their new life, as they wish--the socialist life."

In the years of the antifascist struggle, as in the bright years of the construction of the new social order, the moral and political traits of our glorious working class manifested themselves with great vigor. Immediately after liberation, at the start of September 1944, the new trade unions were created, unified unions, whose role has been and is to assemble the forces of the working class into a united front and to direct them toward the great objectives that inspire the whole Romanian nation, free, independent and sovereign.

The Romanian people's heroic struggle put a definite end to the domination of those who had brought the country to the brink of a national disaster. Under the party's banner, the Romanian people gained their right to a new life, acquired their national and social freedom, forging on the land of Romania the bright edifice of socialism and preparing for the transition to communism.

The remembrance of the tragic events occurring four decades ago brings out strongly the significance of history's lessons, the grave consequences that can come about through tolerance and a conciliatory attitude toward fascism, through a lack of vigilance and firmness toward the policy of aggression and violation of the interests of the peoples. The recrudescence of neofascist practices of violence and assault, of propagation of racism and chauvinism, of bitter hatred for democracy and progress strongly requires all the progressive social forces, the politicians, the peoples to do everything so that history does not repeat itself, so that the steamroller of fascism never again moves through the world.

ECONOMIC UNITS MUST SET UP CANTEENS FOR WORKERS ABROAD

Bucharest BULETINUL OFICIAL in Romanian Part I, No 74, 22 Sep 80 pp 1, 2

[Text] The Council of State of the Socialist Republic of Romania decrees:

Sole article--Council of State Decree No 162/1978 on the rights and obligations of working cadres sent abroad for the execution of work and for technical assistance, contracted for by Romanian economic units, is amended as follows:

1. Article 3, paragraph 1 will read as follows: "(1) The units sending the cadres are obliged to organize canteens or to insure conditions for preparing meals. The expenses incurred by the organization and operation of the canteens or the expenditures incurred in insuring conditions for preparing food, including expenditures representing the benefits which are given to the cadres working in the canteens, are taken care of by the units sending the personnel, within the limits of the sums provided for this purpose in the documentation which is approved, according to the law, for each contract separately, both for existing canteens and for those which will be organized in the future."

2. Article 8, paragraph 2 will read as follows: "(2) Working cadres who are under the overall contract system receive benefits in the currency of the respective country, in accordance with the volume of work actually done, with the observance of the deadline specified in the contract and within the limits of the sums specified in the sale report. The overall contract supplement, defined as the difference between the sum stipulated in the overall contract agreement and the sum of the monthly advances received up to the level of compensation of the workers during the period of the execution of the work contracted for, is given 50 percent in lei and 50 percent in the currency of the respective country, at the time of the completion of the work contracted for."

3. The table in the annex to Council of State Decree No 162/1978 is amended in accordance with the annex to the present decree. [Footnote:] The annex is being distributed to the institutions concerned.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

POLISH LEADERS THANK SOVIET LEADERS FOR ANNIVERSARY GREETINGS

LD121521 Moscow PRAVDA in Russian 9 Aug 80 p 1

[Text] To Comrade L. I. Brezhnev, general secretary of the CPSU Central Committee and chairman of the USSR Supreme Soviet Presidium, and Comrade A. N. Kosygin, chairman of the USSR Council of Ministers.

Esteemed Comrades:

On behalf of the PZPR Central Committee, the Polish Council of State and Council of Ministers and on behalf of the Polish people we send you, the CPSU Central Committee, the USSR Supreme Soviet Presidium, the USSR Council of Ministers, and the fraternal Soviet people warm thanks for your friendly congratulations and wishes on our national holiday--the 36th anniversary of Poland's resurrection.

The profound changes which have taken place in all spheres of our country's life are a graphic confirmation of the correctness of the socialist path of development chosen by the Polish people 36 years ago. The results of the close fraternal cooperation based on the fraternal friendship and indestructible alliance of the People's Poland with the USSR are also based on the foundation of our achievements.

Continuing the work of building a developed socialist society and implementing the eighth party congress decisions, our country together with the Soviet Union and the other fraternal socialist states will continue to make its contribution to consolidating the unity and strength of the socialist community in the joint struggle for peace and progress in Europe and throughout the world.

We take this opportunity to convey to you, dear comrades, and to the CPSU Central Committee, USSR Supreme Soviet Presidium and USSR Council of Ministers and all Soviet people the most heartfelt wishes for further successes in communist building and in the struggle for peace and socialism.

[Signed] E. Gierek, first secretary of the PZPR Central Committee; H. Jablonski, chairman of the Polish Council of State; and E. Babiuch, chairman of the Polish Council of Ministers

WARSAW PACT MANEUVER REVEALS OPERATIONAL TACTICS

Rostock OSTSEE-ZEITUNG in German 12 Sep 80 p 3

[OSTSEE-ZEITUNG report of third day of "Comradeship-in-Arms 80" maneuver: "Soviet Airborne Troops Deployed; Precise Operation of Transport Pilots and Paratroops"]

[Text] On the third day of battle heavy transport planes with paratroops from the Soviet Union approach the maneuver area. The battle orders read: A sector of terrain deep in the "enemy" operational area is to be occupied to achieve favorable conditions for the attacking main force of the ground troops.

The action is observed from the command posts by Secretary General of the SED Central Committee and Chairman of the Council of State of the GDR Erich Honecker, Chairman of the National Defense Council Willi Stoph, Chairman of the Council of Ministers Horst Sindermann, the speaker of the People's Council and other members and candidates of the Politbureau. Along with the commander of the maneuvers, Army General Heinz Hoffmann, minister for national defense of the GDR, other members of the GDR party and state leadership are present, as well as the defense ministers of the fraternal socialist countries.

Strong gusty wind drives the clouds across the sky. The morning stillness is suddenly broken. Modern fighter bombers attack the "enemy" position in the landing area. Bombs and rockets explode incessantly. Columns of smoke and dust rise everywhere. Far above fighter aircraft are circling. The area is sheltered against "enemy" air attack.

Deep regular throbbing fills the air. Contours of heavy transport planes come into view. The first plane arrives at the landing area. Doors open. Like pearls on a string paratroopers jump from the transport craft. A short free fall, then the parachutes open. A few seconds later a broad band of white domes covers the sky; the parachutes glide uniformly to the ground. Submachineguns rattle. The paratroops touch ground, immediately untie their parachutes and go into action--in short order this advance party occupies the area and secures it for further action.

The next column of four-engine Ilyushin transporters arrives. Suddenly small guidance chutes appear at the rear gates, square packets fall from the planes.

Gigantic cargo parachutes open and stabilize their descent. The parachutes glide slowly to the ground. Immediately above ground braking rockets fire. Tons of equipment--airborne BMD tanks and armored personnel carriers with antitank rockets--land softly.

Further IL-76s follow. The main force of the airborne unit approaches. Hundreds of parachutes are now floating in the air at the same time. On ground the battle units get organized, the drivers and gunners of the BMD unstrap their vehicles from the platforms. The soldiers with the blue berets climb aboard, follow the advance party, and open fire.

A BMD--armed like the battle vehicles of mechanized infantry with cannon, machine gun and guided antitank rockets--drives at great speed to the observation point. The commander of the unit, Lieutenant Colonel Semyonov, reports to the commander the successful conclusion of the airborne landing. He receives orders to occupy favorable positions to defend against "enemy" attacks.

With this airborne landing--50 years ago for the first time a Red Army unit was dropped by parachute at maneuvers--the "Blue Berets" continue the glorious battle traditions of their branch. All airborne units had been designated guard units in the Great Patriotic War. Some 196 of their members were designated Hero of the Soviet Union. Their example inspires today's soldiers to achievements such as those reached on that day during the "Comradeship-in-Arms 80."

The airborne operation from a height of 600 meters under difficult meteorological conditions has been concluded. Soviet soldiers and officers have lined up to receive testimonial from Erich Honecker. The demonstration of outstanding military competence, solid training, courage and bravery of the members of the airborne troops and the transport pilots of the Soviet Army are highly praised. Erich Honecker congratulates the Soviet soliders. The same praise is voiced by Army General Heinz Hoffman and Marshals Dmitriy Ustinov and Viktor Kulikov.

Soldiers of Three Armies Establish a Bridgehead

The second maneuver terrain in the central sector of the GDR: The commander describes the military situation. A water barrier has to be forced under strong "enemy" fire. Conditions for a rapid advance of the troops, their crossing on a broad front and continuation of the attack on the other bank must be established. The commanders, Lieutenant General of armored troops

Roman Savochkin of the Soviet Army and Major General Pavol Wrlik of the Czechoslovak People's Army [CVA] make the decision to establish a bridgehead with massive employment of rockets, artillery, helicopters and fighter planes.

By radio and telephone orders reach the headquarters and command posts of the concerned units of the NVA, the Soviet Army, and the Czechoslovak People's Army seconds later. Massive artillery barrages interrupt the silence. Helicopters and fighters drop without intermission bombs and rockets on the "enemy" bank. The river here is about 300 meters wide. Transport helicopters land airborne troops. The advance party in concentration breaks through the "enemy" positions. Soldiers of the three participating fraternal armies establish a bridgehead in heavy battle. A few meters above the water surface helicopters are hovering. While the rotors cause heavy waves, underwater demolition divers jump in twos with lightning speed.

Equipped with diving suits, flippers and oxygen equipment they reconnoiter the crossing points to the "enemy" bank. In twos the divers remove obstacles and mine fields under heavy fire. Road markers are set. The path is clear.

In "enemy" fire armored personnel carriers dive into the river. Their tracks churn up the water.

In quick drive, with cannon and machineguns firing, the positions on the cleft bank are reached. Waves upon waves follow. Mechanized riflemen of the NVA Robert Uhrig unit and the CVA Jiri Podobrady regiment demonstrate high military competence. Like anti-tank gunner Waldemar Marks they keep their promise to "hit with the first shot." His competence as "Best of the Regiment" is shown also by his Czechoslovak comrade-in-arms, the BMP driver Jiri Denemark.

The last armored personnel carriers of these units are on the "enemy" bank. Now tanks of the Soviet Army cross the stream in an amphibious drive. At the same time ponton engineer regiments begin with bridge construction on the flanks of the crossing sector. Transport vehicles with universal drive approach the water. At a medium water speed at the crossing points the ten-meter long pontons, weighing tons, are dropped immediately into the water from these special vehicles of the Krazs and Tatra type. Every move of the engineers is a correct one. The drivers of tugboats keep the 60-megapond bridge in balance, and prevent its drifting off. In spite of fire tanks, artillery and heavy vehicles pass the two-track bridges at high speed.

The "enemy" succeeds in destroying bridge elements by artillery and air bombardment. Critical minutes for attacking units. But again the engineers prove themselves, going into action with determination and removing

the damage. As in the further course of maneuvers, this action shows the high level of military knowledge of the soldiers of the Czechoslovak People's Army, the National People's Army, and the Soviet Army.

The Soviet soldiers in action here are members of the guard tank regiment that during the Great Patriotic War advanced from the gates of Moscow via Volokolamsk, Kiev and Gdynia to Berlin. The designation of "Hero of the Soviet Union" granted to 10 soldiers and officers, as well as a further 2,500 orders and medals, testify to the battle gallantry of that regiment in the Great Patriotic War.

INADEQUATE MEASURES AGAINST DAMAGERS OF SOCIALIST PROPERTY

Tirana ZERI I POPULLIT in Albanian 22 Aug 80 p 3

[Article by Zigur Kame, director of control in the Ministry of Finance: "Strong Control, Based on the Opinion of the Masses"]

[Excerpts] State control, which is exercised over the entire process of the production and dissemination of the social product, is an inseparable part of the organizing and management activity of state and economic organs. Financial control, in particular, control-auditing, is a component and inseparable part of this control.

Without denying the improvements which have been made, the shortcomings which are evident in the administration and protection of socialist property, especially in some sectors of the people's economy, make it necessary that measures to perfect this control be further strengthened. Despite the continual recommendations and the duties assigned in regard to the strengthening of the work of the control-auditing organs, in practice we still run into attitudes of underestimating and disregarding this work. The fact that in some districts, such as Fier, Puke, Tropoje, Tepelene and Librazhd, the necessary number of auditors and controllers has not been incorporated into the structure is an indication of the existence of these wholly unallowable attitudes. On the other hand, unsuitable individuals, without the necessary qualifications, have been given these positions in Elbasan, Lezhe, Diber and Kukes districts. And what is even worse, the same situation exists in some ministries.

Most of the enterprises and institutions and all the agricultural cooperatives are audited by the auditing and control organs of the executive committees. With the exception of the Ministry of Industry and Mines, the Ministry of Communications and the Ministry of Construction, the ministries have very few units under direct financial control. However, this does not remove the responsibility of the ministries for the control of their economic and financial activity and of the enterprises directly under their jurisdiction. However, they do not give the necessary assistance to the control and auditing organs of the districts and do not properly

execute investigations on the implementation of laws. The Ministry of Domestic Trade and the Ministry of Light Industry and the Food Industry have begun to do a better job in this area but the Ministry of the Communal Economy, the Ministry of Agriculture and others are not doing their job properly.

Our laws and regulations stipulate definite measures of punishment and assign material responsibility to all those who cause damage to socialist property. But sentimental and liberal attitudes, in many cases, have weakened their full activity and full compensation is not made for damage caused. For example, measures against those who cause shortfalls, damage and violations of financial discipline are weak in Tirana, Diber, Mirdite and other districts and in enterprises belonging to the Ministry of Industry and Mines and the Ministry of Agriculture. In particular, the matter of the compensation for damages caused to socialist property, is not properly treated. For example, in Skrapar, Lushnje and Kruje districts, only 22 percent of the damage is compensated for. This shows that the organs and individuals charged with issuing compensation orders in the enterprises, executive committees and ministries have had liberal attitudes toward damagers of socialist property and violators of financial discipline. The control and auditing organs are also responsible for this situation since they have not done their duty as they should to strengthen their work and to be intolerant toward such attitudes.

The reduction of the time between inspections is important in preventing damage to socialist property. The intervals between inspections are unjustifiably long and this has a bad effect on the process of preventing shortfalls and remedying them. Also, there are overall, global inspections, which are not properly prepared and organized; they have no effect and produce no results. This is illustrated by the fact that in some enterprises and agricultural cooperatives the violations continue even though inspections are made. There are no re-inspections to see if tasks have been implemented.

Above all, the results in the protection, administration and strengthening of property will improve to the extent that the opinion of the masses of workers is solicited and brought to bear against every negative manifestation, involving the revolutionary opinion and activity of the public in inspection activity.

POWERS OF VILLAGE, CITY DISTRICT, CITY PEOPLES COUNCILS

Tirana GAZETA ZYRTARE in Albania No 5, Jul 80 pp 97-124

[Albanian People's Assembly Presidium Decision No 255 of 30 June 1980: "On Determining the Tasks of the People's Councils of the Villages, United Villages, City Quarters and Cities and of the Quarters of Tirana City"; passages between slantlines printed in boldface]

[Text] On the basis of Article 78 of the Constitution and of Article 12 of the Law "On the People's Councils," the Presidium of the People's Assembly of the People's Socialist Republic of Albania has decided:

1. To approve the tasks of the people's councils of the villages, united villages, city quarters and cities and of the quarters of Tirana City.

2. In accordance with these tasks, the Council of Ministers, the ministries, the other central institutions and the executive committees of the district people's councils must re-examine the legal acts that they have enacted and make relevant changes.

3. The ministries, other central institutions and executive committees of the district people's councils must adopt appropriate organizational measures for the complete implementation of these tasks.

This decision comes into force immediately.

Tirana, 30 June 1980

Decision No: 255

For the Presidium of the People's Assembly of the People's Socialist Republic of Albania:

Xhafer Spahiu, Secretary — Haxhi Lleshi, Chairman

Tasks of the People's Councils of the Villages, United Villages, City Quarters and Cities and of the Quarters of Tirana City

The people's councils of the villages, united villages, city quarters and cities and of the quarters of Tirana City--in addition to the general tasks stipulated in the Law "On the People's Councils"--also implement these concrete tasks in the relevant territorial administrative units.

In the execution of these tasks, the people's councils are guided by the fundamental principles sanctioned by the Constitution of the People's Socialist Republic of Albania and by the Law "On the People's Councils."

Tasks of the Village People's Council

I. /In the political and administrative field:/

1. The village people's council organizes the work for the knowledge and the execution of the laws by the working people.

2. Takes care of maintaining order and peace, of preventing penal acts and other violation of the laws and calls to account the representative of the police organ.

3. Calls to account the brigade leader or the person in charge of the sector of the agricultural cooperative, of the agricultural enterprise and of the institutions that conduct activities in its village for the fulfillment of the plan tasks and for all problems under its jurisdiction.

4. Cooperates with the social organizations in solving state and social problems.

5. Monitors the implementation of the statute of the agricultural cooperatives and of the Labor Code in the agricultural enterprises and of the other legal acts that have emerged from their execution.

6. Is concerned about the work of the village people's court and people's prosecutor and calls the latter to account.

6. Encourages and supports revolutionary initiatives and actions.

8. Regularly organizes the presentation of reports by the workers of trade, communal services and employees to the people.

9. And organizes audiences for the population; it examines, verifies and solves the proposals, observations, complaints and requests of the members of the agricultural cooperative and of the workers of the agricultural enterprise within its jurisdiction, against the illegal activities of the brigade leader or of the person in charge of the

sector. The decision of the village people's council is binding for the brigade leader, the person in charge of a sector and the other persons with responsibility.

II. /In the agricultural field:/

1. The village people's council examines and approves the draft production plan and the draft financial plan of the work brigade or the sector and controls its implementation.

2. Minitors the implementation of the Declaration of the Central Committee of the Albanian Workers Party and of the Council of Ministers of 29 April 1967 and of other decisions.

3. Assists and checks the complete participation in work of the members of the cooperative and of the agricultural enterprise workers.

4. Exerts control over the protection of the agricultural lands and over the systemization, utilization and improvement of its productive capacity, as well as over the protection of agriculture.

5. Monitors the execution of the legal provisions on the protection and administration of forests, grasslands, hunting, fishing areas and medicinal plants.

6. Monitors the implementation of the tasks and regulations in regard to the struggle against plant diseases and contagious diseases in domestic animals.

7. Monitors the organization and utilization of water for irrigating the land of the cooperative members.

8. And calls the brigade leader of the livestock sector to account in regard to the conditions and development of the livestock sector and takes care of animals on the land of cooperative members.

III. /In the field of defense:/

1. The village people's council takes measures to assure the military mobilization of the people and of materials and participation of the citizens in the execution of military drills, and of the exercises to test preparedness and combat alerts, and monitors the military training of the citizens.

2. Implements the regulations on the drafting of the citizens.

3. Executes the tasks entrusted for the state civil preparedness for wartime, as well as for the situation and preparedness of civil defense (MCR) services and formations.

4. Monitors the work for the building of air-raid shelters for the village needs and adopts measures for their preservation and maintenance.

It monitors the fortification works executed by the inhabitants of the area.

5. And directs the work for the organization of the operational watch and communications service. It monitors the system of warning the population, the system of observation and so forth. It organizes the work for the knowledge of civil defense signals by the population and the use of these signals. It monitors the maintenance of warehouses of the volunteer forces.

IV. /In the planning and finance field:/

1. The village people's council presents, to the united village people's council, the needs for relevant funds for education, culture, health, trade and communal works and requests credits for improving housing conditions.

2. Monitors the fulfillment of the budget plan sent by the united village people's council for the village.

3. Exerts its control over and analyzes the fulfillment of economic and financial tasks of work brigades or of sectors in the village.

4. Monitors, analyzes and adopts measures on the preservation and administration of socialist property.

5. Examines requests for economic aid presented by members of the agricultural cooperative who are unable to work and who have no income and sends them to the united village people's council for approval, and monitors the implementation of the decision.

6. And monitors and takes measures against the nonauthorized practice of professions and against private business and prosecutes the offenders.

V. /In the field of construction:/

1. The village people's council gives its opinion about the village plan and executes it.

2. Takes measures to prevent illegal construction. It decides on the suspension of projects built in disharmony with the village plan and without building authorization, makes a report on this action and sends it to the village court and, immediately, informs the united village people's council.

3. In accordance with the village plan, it determines the place and the order of construction projects and of repairs of economic, social and cultural facilities and of privately-owned houses.

4. It gives its opinion to the united village people's council on the requests made for new construction.

VI. /In the field of communications:/

1. The village people's council organizes, when necessary, the work for the opening of roads and monitors their maintenance.

2. And organizes, with its own forces, the work for the reopening of the roads obstructed by snow and for their repair when damages have occurred as a result of a natural disaster, and for the re-establishment of communications.

VII. /In the field of trade:/

1. The village people's council monitors the implementation of the plan for the circulation and collection of goods and takes care of the regular supplying of the people with consumer goods and plans the distribution of building materials. It also attends to the fulfillment of the plan for purchases and sales and the plan for agricultural products for exports.

2. And monitors the execution of the legal provisions by the state trade units and the agricultural cooperatives for good service and for the exact application of prices set by the responsible organs and of the rules for weight and measurements, for cleanliness and so forth.

VIII. /In the field of the communal economy:/

1. The village people's council exerts control over the administration and maintenance of the state buildlings in the village.

2. Monitors the work of all units of the communal services in the village.

3. Is concerned about the beautification of the village and of cultural and social objects with gardens and so forth by means of voluntary work.

4. Takes care of the maintenace of the electric and telephone systems.

5. Takes measures to supply the population with hygienically pure drinking water and monitors the protection of the purity of water sources and the maintenance of fountains, wells and reservoirs of drinking water.

6. And determines the location of cemeteries and takes care of their maintenance.

IX. /In the field of education and culture:/

1. The village people's council monitors and takes measures for assuring compulsory school attendance in the 8-year schools and for achieving the proper number of students in the middle schools with or without interruption of work.

2. Monitors the work done by schools for the comprehensive education of students and takes measures to satisfy the needs of school, cultural house, kindergarten, the museum and so forth.

3. It activates the village intelligentsia on the various problems, enlists its opinion and entrusts it with the study of these problems.

4. Directs and monitors the cultural center and is concerned with establishing cultural and artistic groups and other activities developed for the education of the masses.

5. Manages the physical-educational activity of the village (setting up sports teams and their activities).

6. Manages and monitors the work carried out in kindergartens and approves the admission of children in kindergartens and is concerned about increasing their participation in kindergartens.

7. Monitors and takes measures for the preservation and maintenance of monuments and of commemorative plaques at sites where events of the struggle for freedom and independence have taken place, especially, events of the Anti-Fascist National Liberation Struggle and of the building of socialism of the monuments of art and culture and of other works that have a historic value.

8. Manages the activity of the museum and is concerned about its continual enrichment.

9. Monitors the building of schools and of cultural and sports projects and their repair.

10. Decides on and grants the right to study to students who are sent to lower technical and vocational schools and to middle schools and gives its opinion on granting scholarships.

11. Approves and monitors the educational plan campaign for the preparation of the new school year.

12. And takes care of the opening of vacation centers for children during the summer.

X. /In the field of health:/

1. The village people's council takes care of the people's health by means of compulsory vaccination and the struggle against contagious diseases, adopts measures for the cleaning of streets and squares and monitors the painting of the various dwellings and buildings and the work for the hygiene of the village (cleaning of conduits and the purification of the drinking water with chlorine).

2. Monitors the work of the doctor, the midwife and all other workers of the health departments.

3. Manages and supervises activities in kindergartens and approves the admission of children to them.

4. Directs the work of the demographic commission and looks after the protection of the health of mother and child.

5. And creates the guardianship commission; and sees to the placement of orphans, the aged and the mentally handicapped in appropriate institutions.

XI. /The tasks in various fields:/

1. The village people's council monitors the direct participation of cadres in production.

2. Designates the workers that are required to work in the economic enterprises, in accordance with the plan approved by the united village people's council.

3. Allows the distillation of raki [brandy] in the areas authorized by the executive committee of the district people's council.

4. On the basis of the plan, it approves the list of workers who are sent to training courses.

5. Monitors the implementation of state discipline by employees and other workers. It grants leave, according to established regulations, to school directors, health workers and salespersons. All these people must notify the people's council when they leave for reason of work.

6. Proposes the granting of moral incentives.

7. Regulates the integration in the work force of the new forces in agricultural enterprises, as well as the persons with limited capabilities and the disabled.

8. Takes care of the execution of the legal provisions on vital statistics.

9. Manages and monitors the work of bakeries and the operation of grinding mills.

10. Appoints or grants admission papers for work to service workers in the health, educational and cultural institutions, to those of the communal services and to the salespersons in the trade system, in accordance with established criteria and, when it is necessary, it takes or demands the adoption of disciplinary measures on the basis of the provisions in force.

Appoints and dismisses from work the person in charge of the cultural center.

Appoints and removes from work the workers of the trade units and of the services administered by the agricultural cooperatives.

11. Encourages the activities of the people's prospectors for useful mineral ores, of the collectors of folklore, of the workers of the people's health sector and of those engaged in archeological explorations and so forth.

12. And establishes and checks the schedule for services in all state premises and in the agricultural cooperatives.

/Footnote:/

The village people's council, which is directly connected with the district, also executes the tasks of the united village people's council.

Tasks of the United Village People's Council

I. /In the political and administrative field:/

1. The united village people's council manages and monitors the village people's councils in all their activities and organizes the work for the ideological and vocational education of counsellors.

2. Calls to account the directors of the agricultural cooperative, the agricultural enterprise and of other sectors and institutions that carry out activities in its area in regard to the fulfillment of the plan and other problems under its jurisdiction.

3. Cooperates with social organizations in solving state and social problems.

4. Supervises the implementation of the Statute of the Agricultural Cooperatives and of the Labor Code in the enterprises operating in its territory, as well as the other acts that have emerged from their implementation.

5. Organizes the work of making the laws known to the working people and preventing penal acts and other violations of the laws, and takes care of keeping order and peace; and calls to account the representative of the police organ in regard to its activities, instructs him and monitors his activity.

6. Organizes audiences for the people, and examines, verifies and solves the proposals, observations, complaints and requests of the

of the agricultural cooperative, of the workers of the agricultural enterprise and of other sectors that are under its jurisdiction, against the illegal activities committed by the leadership of the agricultural cooperative or the administration of the agricultural enterprise and of other sectors. The decision of the people's council is binding for all these organs.

7. And encourages and supports revolutionary initiatives and actions.

II. /In the field of agriculture:/

1. Monitors the implementation of the Declaration of the Central Committee of the Albanian Workers Party and of the Council of Ministers of 29 April 1967 and of other decisions.

2. Controls and takes measures for the conclusion and execution of contracts, for the realization of centralized net revenues, and for the use of credits in accordance with the plan, and with effectiveness, and for their repayment on schedule.

3. Assists and monitors the full participation in work of cooperative members and agricultural enterprise workers.

4. Exerts control over, and seeks to take measures for, the protection of the land, the utilization and improvement of the productive capacity of the land and the protection of agriculture.

5. Monitors the implementation of the legal provisions for the preservation and administration of forests, grasslands and hunting, and fishing areas, of fruit tree growing and of medicinal plants.

6. Calls to account the leadership of the agricultural cooperative in regard to the situation and development of livestock and takes care of domestic animals in the yards of cooperative members.

7. And monitors the implementation of the tasks and regulations for the struggle against contagious diseases in domestic animals and against plant pests.

III. /In the field of defense:/

1. The united village people's council monitors and controls the assurance of the military mobilization of the people and materials and the participation of the citizens in the execution of military drills, of exercises to test preparedness and combat alerts, and takes care of the military training of the citizens.

2. Takes measures for the fulfillment of its entrusted tasks on schedule, for the state civil preparedness for war and for the situation and readiness of the services and of the civil defense formations (MRC).

3. In cooperation with the responsible commands, it helps organize, operate and supply the necessary material base for the military training centers.

4. Monitors and follows up the implementation of the work plans for civil defense and the administration and maintenance of the air-raid shelters of the population.

5. Organizes the operational watch service and takes measures for the permanent readiness of the system of communications, of informing and signaling air-alerts and of the stations for air detection and observation.

6. And takes measures to keep in good conditions the fortification works of the army, of the FVVP [?Voluntary Patriotic Work Forces] and of the MCR situated in its territory.

IV. /In the field of planning and finance:/

1. The united village people's council examines and approves the draft plan of production and finance of the agricultural cooperative, of the agricultural enterprise and of the health, educational, cultural, trade, communications and post and telecommunications sectors.

It monitors and follows up the execution of the plan.

2. It drafts and approves its budget.

a) In the revenues section, the following are included: the revenues from the wealth which the people's council has in its administration; the revenues from the productive work of students; the revenues from the school kindergartens; the revenues from the collection of fines imposed by the responsible crgans; the part of the budget of the district people's council for the sectors of education, culture and health and so forth, without investments; the revenues from the payments for the children of kindergartens and creches; the revenues from the production bases of middle schools; the part that is designated by the general meeting of the cooperative, in accordance with its proposal, on the basis of the statute, for the maintenance of cultural centers, kindergartens and creches that are established by the cooperative itself for the maintenance of the museums, the communal buildings and for the aid fund.

b) In the section of expenditures, the following are included: the funds for communal constructions from the revenues of the united village people's council itself, for the maintenance, equipment and salaries of the personnel; the other expenditures for kindergartens, schools, the cultural house, village museums, creches, hospitals, maternity homes, dispensaries, and consulting centers; the expenditures for the

apparatus of the united village people's council and for the village people's councils under its jurisdiction; the funds for the maintenance, equipment, salaries and other expenditures for cultural projects, creches, and kindergartens; and the aid fund which is financed by the agricultural cooperative.

EDITORIAL URGES OBSERVANCE OF AIR FORCE FLIGHT REGULATIONS

Sofia NARODNA ARMIYA in Bulgarian 19 Sep 80 p 1

[Editorial: "High Discipline Urged on the Ground and in the Air"]

[Text] The level of military discipline is directly related to the political awareness of personnel, has a tremendous influence on the conduct of fliers in combat, and assures successful mastery of complex modern aviation technology and weaponry. Our party has done everything necessary for the Bulgarian People's Army to be highly organized and disciplined, to fulfill its missions in exemplary fashion and be ready to deliver a knockout blow to imperialist aggressors at any moment.

Lenin saw in aware military discipline the most important condition for the strength and invincibility of an army of the socialist type. By his discipline every Bulgarian serviceman manifests most fully his profoundly felt responsibility for the defense of our socialist homeland. This is expressed in practice by a high state of organization, a developed sense of duty, initiative, perseverance in training and in combat, readiness for tests of any kind on behalf of the people and the party. The success of armies in modern combat depends, to a decisive extent, on the state of morale, the level of political and military training, and the combat skill of personnel.

For aviation units the concept of "discipline" is inseparably linked with the organization of flight operations, the maintenance of strict regulation procedure during days of training and the execution of flights, and the timely and precise performance of official duties and the requirements of guideline documents by every soldier. Unswerving observance of flight regulations is a standing and permanent rule for combat teams. Without strict organization and procedure on the ground and in the air the even flow and safety of flights cannot be assured. Lack of discipline and carelessness in everyday life inevitably carry over to the airfield and may create the preconditions for aircraft accidents.

Inculcating discipline means, first and foremost, building a communist world outlook. Of tremendous importance in this regard are the study of

Marxism-Leninism by soldiers and the explanation of our party and government's foreign and domestic policy, the requirements of the military oath and regulations, and the essence of a conscientious attitude towards military service. In addition, constant observance of regulation procedure in the units plays a special role in strengthening military discipline, being the most important means of inculcating in officers, noncommissioned officers and men permanent habits and practices of organization, precision and diligence. The important thing is that everything be done as commanded by the regulations and the manuals. Or, as Comrade Todor Zhivkov quite accurately emphasized in his recent report to the July plenum of the BCP Central Committee: "The main thing is deeds! Not hullabaloo, but deeds; not big words, but the concrete results of works!"

Experience shows that it is hard for soldiers to be trained in the spirit of strictly executing regulations and their specific obligations when the necessary order is lacking. Thus, for example, in the aviation unit where Officer Slavov serves, certain systematic deviations from regulation duties and the violation of discipline and guideline documents had an adverse effect for a certain time on the missions performed by the collective.

This example fully suffices for us to arrive at the conclusion that if an aviation commander limits himself to just explaining the regulations and appealing for the observance of discipline without backing this up by constant concern over strict observance of the day's schedule and improvement of the soldiers' physical and living conditions and cultural recreation, the fruitfulness of educational work will be low. The whole way of life in the subunits must be so ordered that the most favorable conditions are created for successful fulfillment of combat- and political-training plans, for the strengthening of discipline and, hence, for a constant rise of combat readiness as well.

In those units where commanders unswervingly follow the requirements of the regulations, the socialist way of life becomes strong and unshakable; its educational significance and influence on organization and discipline rise. Thus, for example, in the aviation units where officers Sinapov, Kostadinov et al. serve, the officials constantly check on how regulation procedure is observed during flights, on whether motor transport and personnel carry into effect established traffic rules in the region of the airfield etc. Questions of discipline are constantly discussed at party and Communist Youth Union meetings and in sessions of the bureaus. Oral and visual agitation is skillfully used to popularize the experience of the winners in socialist competition.

The continuous improvement of weapons raises the responsibility of every crew, team and element for personal discipline and diligence. New criteria of military discipline have appeared. The role of such components of combat readiness as time discipline, individual and collective responsibility of soldiers for the execution of assigned missions, flight discipline, and combat discipline has been amplified immeasurably. All this

obliges commanders not to tolerate even the slightest deviations from the provisions of regulations or the requirements of instructions and manuals.

Events make ever new, ever higher demands on the armed defenders of our socialist fatherland. What is progress today can no longer satisfy us tomorrow. We must regard even the best results as a foundation for achieving still higher results in combat and political training, as an effort worthily to greet the impending 12th BCP Congress!

AUTHOR CALLS FOR SOBER DEPICTION OF INTERNAL SECURITY HEROES

Sofia RABOTNICHESKO DELO in Bulgarian 13 Sep 80 p 2

[Article by Bogdan Gloginski: "Sons of the Revolution--On the Eve of MVR [Ministry of Internal Affairs] Agencies Day"]

[Text] For several years I have been working on a lengthy novel entitled "Vlast" [Power]. The main hero is a responsible employee in the MVR agencies. Colleagues and friends who know that the novel is already written frequently ask me why I have not yet submitted it to press. Let me confess that I ask myself this question, too. I have an explanation, of course. What holds me back is the realization that we absolutely must no longer write sloppily about these people. The traditional artistic devices amassed during the great "boom" of "crime" and "adventure" literature have long exposed their weakness, while hasty gilding quite frankly covers up their true image and erodes their arduous heroism. Neither from others nor from them have we heard that the employees of the socialist agencies of the MVR are by no means the sort we see in some films or books.

Nor are they the sort they appear to us to be at first glance in the street and in offices.

What is their true character, then? Is it, perhaps, narrow escapes from the dark forest of the criminal world, or finding their way out of the labyrinths fabricated by enemy spies and foreign acts of sabotage? Or is it getting over colds and sieges of sleeplessness from hours on traffic control posts or while making rounds on patrol? There is no denying, all this is heroism of a high and most essential order; it is marked by self-denial and readiness to sacrifice oneself; it merits not only a tip of the hat, but also a bow. But all this in one form or another is true, as well, of many policemen in the most reactionary countries--there, too, they exchange gunfire with gangsters; there, too, they unriddle the puzzles of dangerous recidivists. . .

So it is something else.

Let us think back to the first step of our people's government. What did it have and what did it not have then? It did not have enough bread! It

did not have enough clothing. It did not have its own army. It did not have its own diplomats. It did not have its own economy. It did not have scores and hundreds of things that it required to be active and beneficial. But from the very first second it did have its loyal sentinels--the people's militiamen, the first employees in the young agencies of a just-born, qualitatively new MVR.

That is why our freedom survived. That is why it has grown to maturity.

Yellowed newspaper photographs, stills from oldtime newsreels and the reminiscences of our elders present them to us without counterfeit. Partisans grown lean in blockades and campaigns. Pale political prisoners. Unshaven workers. Apprentices and journeymen from artisans' workshops. Sons of rural supporters of the guerrillas. High-school boys and students from poor families. The party's far-seeing appeal and their great class intuition bade them sew the five-pointed cloth star on their caps, put the red ribbon around their left sleeve, and in the very first minute take their stand at their post without retreating or marching off on two-man patrol.

Now what did they have and what did they not have?

The archives and records of that time indicate that they had plenty of some things. Untreated diseases. Unhealed wounds. Sieges of sleeplessness and fatigue. And they had many--it is inconceivable how many--tasks. The only thing they did not have was pay-rolls. But they stayed at their posts.

Afterwards some perished. While we slept in our peaceful homes, while we were marrying off our sons and daughters and perhaps while we were shopping in the store, they were breathing their last from the stab of a knife or they fell from the direct hit of a bullet. Everybody knows whose knives and whose bullets. There is a list in the ministry of those who perished most valiantly, under the heading: Enlisted forever in the line of battle. We read many names there: Kharizan Tashev, Manol Cholev, Spas Kolevichin, Evstati Zakhariev, Boris Ralev, Georgi Tropaliev, Shaban Aptiev. . . In accordance with the sacred laws of proletarian patriotism and internationalism, in accordance with the wise counsel of Georgi Dimitrov, and from the example of the Soviet members of Cheka, the MVR agencies were transformed, from their very first breath, into an amalgamation of the most honorable sons of the homeland. They rose up in united ranks against foreign and domestic conspirators, against stealthy deeds and treacherous schemes.

According to Lenin's definition, this was and remains a "stubborn battle, bloody and bloodless, violent and peaceful, military and economic, pedagogic and administrative," a battle against the forces and traditions of the old world, a battle for the victory of eternal visions and day-dreams newly bursting forth. But not only is man's striving to surmount pain eternal; our new society's impulsion towards true humanism is inmost, too.

It is in this way that we can explain certain remarkable features of the MVR agencies. How easy it is to serve divinely anointed personages and favored elites: brandish the lash of force, lift the club of brutality and implant fear and subordination. . . Today, though armed with pistols the MVR agencies are called upon to "shoot" with prevention, even against law violators--to persuade, devote themselves mainly to correctional and educational tasks, and fall back on harsh legal punishment only as a last resort.

The poet Damyan Damyanov and I know the chief of an important MVR office, who interceded like a veritable father for the publication of a prisoner's poem. "He was sentenced for evil-doing," the chief insisted. "Let us reward him for something good. . ." I know the head of an MVR okrug administration who went to visit in prison a criminal put behind bars, not by others but by him. I know an official investigator who wept because of an erroneous course in his colleague's actions. All of us know something similar about them. For they are our brothers, our fellow tenants or our neighbors, friends from childhood; like us, susceptible to colds and diseases; like us, husbands and parents; like us, overburdened with family concerns or calamities. But we have always asked more of them. And we will continue to do so, of course. And they must give it, not just within the limits of their working hours and place of work, but everywhere else as well. This is what their military mission commands.

Their front is indeed unbounded. Freed of the duty of serving big shots, castes and elite groups, they devote their waking hours to everything else and that is limitless because it encompasses the whole and happy life of the people, the all-inclusive peaceful labor of the people, the inviolable rights of the people, the most lawful march of the people--the march towards communism, predicted, mapped out and led by the communist party. A great front. A sacred front.

All this, of course, deserves sincere and really penetrating works. But before and above everything else it deserves the involvement of every citizen of the Bulgarian People's Republic.

FRANCE PRAISED FOR 'REALISTIC POSITION' IN RELATIONS WITH CEMA

Wast Berlin IPW-BERICHTE in German Vol 9 No 9, Sep 80 pp 34-40, 64

[Article by Paul Freiberg, GDR Institute for International Politics and Economics: "Realistic Position of France in Foreign Economic Relations with CEMA Countries--Continuous Activity toward Development of East-West Economic Relations--Rejection of U.S. Boycott Course--Positive Development Trend in Commodity Exchange--New Forms of Cooperation"]

[Text] As far as the the preservation of the rule of imperialism and thus the basic anticommunist position are concerned, the foreign policies of the imperialist countries are essentially in agreement; nevertheless, on many specific issues of foreign-policy strategy and tactics in dealing with the socialist countries, they partly assume widely differentiated positions.

This has been confirmed once again in the course of the current aggravation of the international situation which has been brought about by American imperialism. During the first few months of this decade, queer shadings emerged between the positions of the United States and those of Western Europe, something which undoubtedly is objectively due to the fact that the detente process of the seventies revealed the positive results precisely in Europe. In Western Europe itself however one can also observe definite gradiations among the individual imperialist states; they are expressed particularly in the differing position which is being adopted toward the policy of the United States in dealing with the Soviet Union. French Premier Raymond Barre on 10 January of this year described it as follows in a speech: "France has a policy of its own through which it defends its own interests. But that does not mean that it downgrades the solidarity which links it to a large number of countries. Of course, in terms of its spirit, this solidarity does not signify unconditional agreement." This view was underscored also by President Valery Giscard d'Estaing in an interview on 26 February 1980[1].

France's pronounced interest in the continuation of detente was demonstrated above all by the meeting between President Giscard d'Estaing and and CPSU Central Committee Secretary-General and Chairman of the Supreme Soviet USSR Leonid I. Brezhnev in Warsaw on 19 May 1980, which was the first East-West meeting on the very highest level after the dangerous

aggravation of the international situation by United States imperialism and which can be described as "a further expression of the constant and close political dialogue such as it is characteristic of Soviet-French Relations"[2]. In spite of the differing viewpoints of both sides on individual issues, Giscard d'Estaing termed the talks a "positive contribution to detente" whose objective it was "on a high level to clarify the development of the international situation and to find methods to reduce the existing tensions"[3].

This vision held by France and the specific French viewpoint expressed in it by decisive forces among the French bourgeoisie--which is partly running into open resistance in the United States[4], was noted during the Giscard-Brezhnev meeting--did not develop just recently.

Continuation of French Eastern Policy

As we review the development of relations between the two opposing social systems over the past two decades, we can see that France always to a greater degree assumed positions which promoted the advance of these relations--more so than other imperialist states. That also applies to present times. While the attitude of leading French politicians may be contradictory in many ways--above all due to France's strong ties with the military-political and economic alliance systems of imperialism, such as NATO and EC--these ties nevertheless last but not least are also guided by the lessons that were learned to the effect that especially Europe most strongly felt the favorable effects of the detente policy of the seventies and that it is least of all in its interest that the international situation at the turn toward the eighties became considerably more complicated.

This attitude very extensively corresponds to public opinion and thus to the political balance of power in the country. This is why the attitude of leading French politicians, which in many ways is realistic and differentiated, and the specific domestic-policy balance of power must not be disregarded when France's president on 26 January 1980--almost at the height of the anti-Soviet campaign stirred up by the Carter Administration--declared that, in case of growing tensions, questions of security assume greater significance than in the past. France's course heading toward further detente must be confirmed especially for this reason.

France was the first major capitalist country--especially since the middle of the sixties--which began to pursue a policy which was aimed at detente and more comprehensive cooperation with the socialist countries and which thus, up to a certain degree, accommodates the constructive proposals of those countries regarding the consolidation of international security. This adaptation process in France's foreign policy took place earlier and more profoundly than in other imperialist powers. Economic, trade-policy, and scientific-technical interests and requirements, the powerful pressure from the anti-imperialist forces in the country's interior, the search of French governments for an enhanced role for France and greater independence

within the imperialist camp, as well as the relatively pronounced realism of certain circles among the bourgeoisie brought about this approach between French foreign policy and certain viewpoints and attitudes held by the socialist states[5].

To be sure, this process did not develop free of contradictions and delaying tendencies but, as its result, relations between France and the socialist states developed positively over the past 15 years. It was undoubtedly significant for the stabilization of peace and the in-depth development of detente in Europe, especially also for the development of constructive relations between countries with different social systems.

In an interview with the Moscow publication NEW TIMES, in December 1979, France's Foreign Minister Jean Francois-Poncet observed: "France and the USSR were among the first countries to pave the way leading to Helsinki. Just shortly before the CSCE, they tried to give detente a concrete content, for which purpose they launched and developed bilateral cooperation. Now they must contribute to the consolidation and in-depth development of this detente process"[6].

To be sure, it would not be in keeping with the dialectics of the development of international relations if one were to overlook the fact that, since the beginning of the seventies, in view of the growing economic difficulties and the rising influence of the left-wing forces within France, tendencies can be observed among the ruling circles of that country toward an increased turn to the United States and a renewed approach to NATO. The realism of the ruling circles however is so far developed that France, precisely in times of aggravation of the international situation, as a rule pursued a course which ran counter to such complications.

For Continuation of Detente

The continual efforts not to be drawn into the peace-threatening, global-political machinations of American imperialism and certain right-wing forces in Western Europe, especially in Great Britain and the FRG, is of great politicial significance especially at the present time regarding the further development of East-West relations. Giscard d'Estaing on 26 February 1980 underscored, on French television, the fact that his country to be sure does belong to NATO and stands with that alliance, that it is connected to other Western democracies with bonds of solidarity, but that all of that did not prevent France from pursuing an independent policy and rejecting a condition of subordination. In view of the current conflict situation, he viewed on of the most important tasks of the chief of state to reside in "crisis management, that is to say, finding peaceful ways out of crises."

The French foreign minister had adopted the same attitude already back in the middle of February 1980 in an interview with the Finnish news agency STT when he observed that France starts with the idea of continuing the dialogue with the Soviet Union and doing nothing that might cause the

Cold War to break out again. His country, the foreign minister stressed, considers the process launched by the Helsinki Conference to be very important; he considered it a stabilizing and promoting factor among the group of European countries, the United States, and Canada. The events in Afghanistan in no way reduced the need for seeking for ways to solve security problems in Europe.

France's differentiated attitude emerged also during the Bonn-Paris Summit meeting early in February of this year, when Giscard d'Estaing, after completion of his meeting with FRG Chancellor Helmut Schmidt rejected any assumptions to the effect that the joint declaration at the end of their meeting signifies a "hardening" toward the Soviet Union and stressed that this instead is right in line with France's policy so far, that is to say, to defend the gains of detente[7]. Early in 1980, the French foreign minister had already adopted the viewpoint that his country would not approve any economic sanctions against the Soviet Union. If one were to adopt "hasty" economic reprisals, like the United States, he observed, then one would thus be renewing the Cold War and one would be putting an end to detente[8].

Economic Cooperation: Objective Requirement

The economic factor is of by no means minor significance for France's realistic attitude. The French monopoly bourgeoisie has for a long time considered it to be a special task to push the country's industrialization so far that France's lag, regarding its potential, especially with respect to the FRG, but in some areas also with respect to Great Britain, would be reduced and that its international positions would thus be strengthened. That calls for fundamental structural changes in the economy[9], for which foreign policy is to create favorable conditions and in particular is to open up possibilities for industrial expansion.

Economic relations with the socialist countries play a by no means minor role here. France hopes to get above all long-term and steady supply sources for raw material and fuels from them, plus an expansion of the sales market for the products of its own industry and agriculture. With the help of scientific-technological cooperation, especially with the Soviet Union, the technological gap with respect to the other capitalist industrial countries, above all the United States, is likewise to be closed. This applies especially to the area of basic research. Although a growing number of French enterprises in recent years participated in economic cooperation, one must nevertheless not overlook the fact that, within the French bourgoisie likewise, there is no uniform opinion as to these relationships and that their economic and political benefits are being judged in different ways. Certain circles among French monopoly capital are also interested in exploiting intensified economic relations so as to influence the socialist countries, to create a situation of economic dependence or to achieve political effects.

But it is not only foreign-policy considerations--such as the above-mentioned expansion of the foreign-policy leeway--which cause larger segments of

French monopoly capital to come out in favor of developed economic relations with the socialist states. Instead, problems of France's economy play an important role. Here we must also look for decisive motivations behind this kind of collaboration: the relatively heavy dependence of the French economy on foreign countries, the slowdown in the development of the French economic situation in recent years, the fact that the balance of trade has essentially shown a deficit since 1962, the need for structural changes in the economy, etc.

Above all however, the tempo of economic growth has slowed down severely in 1979; the output in the capital goods sector, mostly sustained by the foreign demand, has declined severely and unemployment has revealed a rising tendency for many years, etc.[10]. On top of that there is the further aggravation of competition on the world market. In view of these international economic factors as well as the fact that the market is shrinking back home due to the developing cyclic economic crisis it is entirely understandable that French monopoly capital places great value on the expansion of trade with the socialist countries.

This also applies in the current complicated international situation. For example, at the end of March 1980, a comprehensive treaty was signed between the French Ambassador in Moscow, H. Froment-Meurice, and Soviet Foreign Minister N. S. Patolichev; according to that treaty, two French companies, specializing in the exploration and extraction of petroleum on the high seas, received a contract amounting to F500 million. According to the provisions of the contract, they will erect two factories in turnkey condition, specifically, near Baku and in the Volga Delta. These factories will turn out petroleum extraction systems which will be installed starting in 1981 in the oil fields in the Caspian Sea, in the Far North, and in the Pacific Ocean off Sakhalin[11]. The fact that this kind of equipment was a special topic of embargo discussions in the United States only underscores France's independent attitude also in comparison to other EC countries.

In Paris there is growing realization that Washington's pressure upon its partners is based only superficially on the so-called Afghanistan problem but in fact is motivated by the idea of once again achieving predominance over the allies or taking up the role of a world policeman and in this sence reducing East-West economic relations and placing them under American control.

The exponents of the United military-industrial complex have always been peeved over the fact that peaceful trade with the socialist countries brought increasing benefits to an ever larger number of Western European countries during the seventies. They viewed that as a threat to their own interests because East-West trade also reduces their dependence on United States monopoly capital and thus on Washington's selfish foreign trade policy. This is why the United States is applying massive political pressure on its partners: "If our allies, in view of the threat from the Soviet Union, will retain their earlier business relations with it, then

tension in NATO can become unbearable," threatened American Senator W. Proxmire[12].

On the other hand, business circles in Western Europe, especially France, clearly gave the United States to understand that they do not desire a rehash of the Cold War in the field of economic relations. As Jacques Chirac, a leading French politician, declared recently in Paris, "The economy is a sector in which everybody must look out for his own interests[13]. There is no desire to exchange the way of detente, which was cleared with such great effort, for a course of confrontation in the style of the Cold War.

Through this position, decisive French politicians set a positive example as against the hard-line attacks of the United States and its advocates in Western Europe. This is a stabilizing factor although one may not overlook the fact that, in that country likewise, there are enemies of detente who try to tie the hands of those politicians who pursue a realistic course.

Growing Significance of East-West Trade

At the very focus of France's foreign-policy and foreign-trade relations with the socialist states we find relations with the USSR. In spite of the efforts of the socialist countries and growing French activities in the field of economic cooperation, all possibilities are certainly far from having been fully exhausted.

Thus, the share of the CEMA countries out of French foreign trade is still relatively modest and is about 3-4 percent. On the other hand, foreign trade between France and the CEMA countries rose from $373.1 million in 1960 to $7,322.4 million in 1979 (see table), including, with the GDR, from $20.9 million in 1960 to $579.6 million in 1979, that is to say, during the last couple of years and especially in 1979 we can observe a singificant increase in mutual trade. With an increase of more than 34 percent from 1978 until 1979, France's trade with the CEMA countries during that year grew considerably faster than France's total foreign trade (up 29.5 percent).

Source: Statistics of Foreign Trade, Monthly Bulletin (published OECD), Paris, Series A, current.

If we look at the overall development of French foreign trade with the CEMA countries, we can find that the main growth rates took place during the seventies, in other words, during the period of time when the international detente process began to unfold and had an advantageous effect on economic relations between countries with different social systems. In spite of the crisis-like development on the international capitalist market in the middle of the seventies--which also impaired East-West economic relationships--France's foreign trade with the CEMA countries during those years likewise revealed relatively steady growth rates which partly were above those of other capitalist countries. Soviet orders thus made it possible to triple French-Soviet trade between 1975 and 1979.

Among the socialist countries, the USSR is France's biggest trade partner. While the absolute trade volume, in relation to French foreign trade, is relatively small, imports from the Soviet Union nevertheless are by no means insignificant when it comes to meeting the raw material requirements of certain French industry branches. Thus France procures the following shares of its total imports from the USSR: anthracite 45 percent, chrome ore 27 percent, cotton 42 percent, asbestos 36 percent, and raw aluminum 12 percent[14].

Since the start of this year, France has also been getting natural gas shipments from the USSR via the pipeline that runs through Austria and the FRG to France from where it is piped into the French network by the French government gas supply enterprise "Gaz de France," With the commissioning of this direct pipeline from the Soviet Union, France first of all gets 4 billion cubic meters of natural gas and that provides 14 percent of the French gas supply, as against 9.5 percent until now[15]. This is a share which contributes to the stability of the French energy supply to a by no means minor degree; in the meantime, "Gaz de France" has expressed its interest in increasing Soviet gas deliveries[16].

But the structure of mutual trade is still unsatisfactory above all for the CEMA countries and here we come to one of the causes of the negative foreign trade balance between the CEMA countries and France. Thus, the raw material and fuel share out of imports from the CEMA countries in 1977 came to about 60.6 percent (80.1 percent in 1960) while the share of machinery and equipment (SITC Group 7) was 8.3 percent in 1977 (4.2 percent in 1960). In trade between the USSR and France, the latter grew from 1 to 3.6 percent between 1960 and 1977[17]. To be sure, it must be noted that the share of finished products generally reveals a rising tendency and that the share of raw materials and fuels is declining, in other words, foreign trade is increasingly becoming adjusted to the requirements of effective division of labor.

One cause of this commodity structure, which so far is not satisfactory for the CEMA countries, in to be found in the existing discrimination procedures. For example, right now, about 35 percent of all GDR exports to France are subjected to obstructive import regulations[18]. Compared to other EC countries and those that are associated with the EC, commodities

impoted from the CEMA countries are slapped with considerably higher customs duties. The restrictive measures, ordered partly by France and partly by the EC, frequently hit precisely those commodities which are among the most important export commodities from the CEMA countries. Here again we can still see the considerable discrepancies between the status of political relations and the practice of economic relations. The USSR repeatedly--for example, during summit meetings, during the conferences of mixed commissions--pointed up possibilities for expanding economic relations whose implementation however, for the previously mentioned objective and subjective reasons, especially on the French side, is making only gradual progress.

It is precisely the realistic attitude of France in the complicated international situation--such as it emerges at the present time--which leads us to expect that economic relations with the CEMA countries will likewise reveal a further rising trend and that their growth rate will speed up, something in which leading French personalities repeatedly expressed their interest. According to the ideas developed at the 14th conference of the Permanent Mixed Soviet-French Commission for Scientific-Technical and Economic Cooperation, in October 1979, trade once again is tripled between 1980 and 1985[19].

For the Sake of Expanding Relations with the GDR

The general continuity of French foreign policy toward the socialist states likewise emerges in relations with the GDR. During his visit to Berlin early in February of this year, French foreign trade minister Jean-Francois Deniau confirmed that relations between the GDR and the French Republic have developed advantageously to mutual benefit and that there is a common interest in their expansion. This was expressed on the signing of a program, in Berlin, on 1 February 1980, regarding the development of economic, industrial, and technical relations between the GDR and France for the years 1980-1985, as well as the start of negotiations on a ten-year agreement covering economic, industrial, and technical cooperation between the two countries which represents the foundation for bilateral economic relations until 1990 and which was signed in Paris on 24 April 1980. Minister Deniau emphasized on that occasion that it is the desire of the government in Paris and French economic circles, on the basis of this long-term agreement, dynamically to expand economic relations with the GDR, something which will also have positive influence on the development of general relations between the two countries[20].

Olivier Stirn, secretary of state attached to the minister of foreign affairs and member of the French Cabinet, during his visit to the GDR in April 1980 expressed the opinion that the prospects for more comprehensive cooperation with the GDR at this time are to be found especially in the field of railroads, the chemical industry, and motor vehicle construction. These are sectors which--as was confirmed at the 1980 Leipzig Spring Fair--offer starting points for the expanded application of new forms of cooperation[21].

Resistance to Boycott Measures

The attitude assumed by France regarding American boycott demands against the USSR shows that the expansion of economic relations with the CEMA countries is considered a real task. Thus, as even FRANKFURTER ALLGEMEINE had to admit, "The French representatives in Brussels left no doubt that they think nothing of an economic boycott against the Soviet Union. They think that the restrictions ordered now regarding agricultural trade go pretty far"[22].

Early in 1980 already France, in the pertinent administrative committee of the EC, had expressed objections to a grain embargo against the USSR[23]. France in the EC also opposed[24] the credit boycott against the USSR which had been proposed by British lady prime minister Margaret Thatcher. It also rejected the idea of supporting the boycott and technology transfer to the USSR which had been ordered by Carter[25].

There is no need to be astonished that this kind of realistic attitude by France did not produce a benevolent reaction in the United States in the light of the complicated international situation created by American imperialism at the start of the year. Thus, the American magazine BUSINESS WEEK wrote the following on 14 January 1980 regarding French-Soviet trade: "At a time when exports to the Soviet Union from most of the major Western countries and Japan have been paralyzed (something which by the way was not at all true--the author), exports by one particular country are making good headway. Soviet purchases in France during the first months of 1979 attained a value of $1.7 billion, a hefty 42 percent more as compared to the same period of time in 1978. Even more brilliant prospects are to be expected for the French."

France likewise did not fall in line with the 18 March 1980 decision of the United States government to tighten up the embargo against the USSR[26]. Here we also come to the demands which Paris raised regarding an improvement of the grain export policy of EC, regardless of the boycott ordered by the United States government[27].

New Forms of Collaboration with the CEMA Countries

Regarding the further development of economic relations between France and the CEMA countries, it is especially the new forms of collaboration which play an important role. In the interview given by the French foreign minister to the Moscow periodical NEW TIMES in December 1979 we find the following passage: "At this time, neither of our two countries assumes the proper place in the foreign trade of the other country. We must try to correct that situation. But if we want to make our economic relations stable and if we want to give them the necessary dynamics, we must go beyond trade relations and we must move on the road of modern collaboration in the economy and industry"[28].

These forms of "modern collaboration" were successfully practiced already in the past. They are based on the long-term agreement concluded between France and most of the CEMA countries regarding economic and scientific-technological collaboration, covering periods between 5 and 15 years, supplemented by long-term specific programs for the in-depth development of this collaboration (usually running 10 years) as well as agreements for certain sectors (transportation, agriculture, exploration of outer space for peaceful purposes, chemical industry, computer technology and electronics, etc.). Most of these treaties were concluded between France and the USSR but some of them were also signed with other CEMA countries, including the GDR[29].

These agreements lay the foundations for a new quality of complex collaboration which above all paves the way for future development directions in these relationships. Here the following new forms emerge in terms of critical main points: strengthening of industrial cooperation, of compensation projects, cooperation in multinational undertakings, trilateral cooperation (especially with developing countries), and scientific-technologicgal cooperation. Industrial cooperation is concentrated mostly on the sectors of energy, electronics, machine-building (particularly regarding machine-tools), auto-making, metallurgy, as well as the chemical and petrochemical industries.

The erection of industrial complexes in both France and the USSR as well as enterprises in the USSR on a compensation base has been practiced successfully between France and the USSR in the past. Examples here are the delivery of metallurgical and metal-working equipment to France (supplier shipments for the metallurgical combine at Fos-sur-mer, erection of the biggest hydraulic press in the capitalist world in Issoire, etc.), as well as Soviet purchases of equipment and plants for the auto, chemical, and gas industry from France. On a compensation or partial compensation basis, France among other things supplies equipment for the production of styrene, polystyrene, and other chemical products as well as for an aluminum complex[30].

The documents signed as a result of the working conference between L. I. Brezhnev and V. Giscard d'Estaing in April 1979 in Moscow, especially the "Long-Term Program for the In-Depth Development of Economic, Industrial, and Technical Collaboration for 1980-1990," as well as the Agreement on Economic Collaboration for 1980-1985, contain the mutual participation in the construction of industrial facilities in both countries, the construction of factories in the USSR for the production of products in which both countries are interested, on a compensation or partial compensation basis, cooperation in production and scientific research, as well as the grant of services and planning of industrial complexes.

These new forms of collaboration are also developing increasingly between France and the GDR[31]. They are advantageous not only for both sides but also effectively contribute to improving the stability and continuity of relations between the participating CEMA countries and France and to meeting the requirements of the Final Act of Helsinki.

It is especially the development of cooperation and the joint production on a balanced basis which create new possibilities for the diversification of commodity exchange and for the increase in shipments of machinery and equipment, other finished products, semifinished products and energy sources. This kind of development of cooperation on the basis of new forms and methods will have by no means insignificant consequences regarding the development of foreign trade structure and this will also result in an expansion of economic relations between the French economy and those countries.

A new quality in cooperation is emerging also in the longer-term agreements between enterprises and institutions of socialist and capitalist countries, such as, for example, the 10-year agreement on scientific-technical cooperation[32] signed between the French "Finatec" Company and the State Committee of the USSR for Science and Technology or the cooperation agreement worked out by the GDR foreign trade enterprise WMW [Machine-Tools and Tools] Export-Import and by combines of the GDR machine-tool-building industry with the French company group of Linne-PSM, calling for joint production and joint sales[33].

The new forms of collaboration include trilateral economic collaboration, in which French enterprises have also been increasingly participating for several years[34]. To improve economic relations between France and the CEMA countries, there are so-called mixed companies in which CEMA countries and French companies are involved and which in France are active primarily in the sector of circulation.

Scientific-technical cooperation is of no minor significance and it is being promoted especially in France by the government[35]. By stepping up this type of cooperation, the French government among other things is trying to compensate for or to boost the relatively small volume of trade relations. This is indicated particularly by results achieved so far in such modern sectors of science and technology as space research or nuclear energy. Thus, France is cooperating with the USSR in uranium enrichment, French engineers and scientists are working on the proton accelerator in Serpukhov, USSR, and France is conducting joint research with the USSR in outer space.

Looking at the utilization of nuclear energy for peaceful purposes, joint efforts are being developed, while the exchange of information on reactors with fast neutrons, in the field of plasma physics and controlled thermonuclear synthesis is being conducted successfully[36]. French companies also use the Soviet system for evaporation cooling at blast furnaces, they use Soviet technologies for steel smelting (for example, at Schneider-Creusot), etc.

Regardless of the fact that the traditional sectors of cooperation will retain their significance, scientific-technical cooperation, above all with the USSR as France's main partner among the CEMA countries, will undoubtedly

continue to increase during the coming years both quantitatively and qualitatively, as already indicated by the examples mentioned. This is also based on structural interests of the French partner, something which, for example, is underscored by the fact that, in France, a ministry study group for industrial development in strategically important sectors of the economy has been set up with the mission of selecting fields which are of decisive importance to the future of the country's national economy.[37]

Special mechanisms developed a long time ago for the promotion especially of economic cooperation between France and the CEMA countries. On the basis of the Soviet-French declaration of 30 June 1966, two mixed Soviet-French commissions have already been created; they are the "Great Commistion," within whose framework responsible representatives of both sides meet as a rule at least once a year in order to review current and long-range problems of bilateral relations, and the "Small Commission" for scientific-technical and economic cooperation, which already has a series of branch-related mixed study groups[38].

The French government in general is utilizing numerous possibilities in order to promote economic relations with the socialist countries on the government level, for example, through interest rate subsidies connected with export loans or by signing agreements on long-term bank loans.

France's realistic and differentiated attitude in complicated international situations, its independent policy also in East-West relations, in the past influenced the latter favorably both in political and economic terms. This is obviously also the longer-range goal of French policy if we start with its attitude during the first half of this year and if we keep in mind the words spoken by Foreign Minister Francois-Poncet during the previously mentioned interview regarding the goals of French policy, two of which he mentioned" "The first one is to translate into action as completely as possible all of the principles and provisions of the Final Act of Helsinki, a document which with justification is called a program and at the same time a code of detente. Detente will progress and strikes roots only to the extent that the 35 CSCE countries carry out the program, which they signed so solemnly in Helsinki, in the field of politics, economy, and culture, as well as human rights. The second goal, which serves as a supplement to the first one, is disarmament. There cannot be any real improvement in international relations so long as the arms race burdens the economy of the countries and creates distrust"[39].

This attitude by France has a positive effect on the development of East-West economic relations which long ago became a firm component of the entire structure of international economic relations. There are no objective reasons for deviating from the way of detente and restricting commercial and economic exchange. The countries of the socialist community consider the agreement of measures aimed at the further development of economic and scientific-technical cooperation between the countries of the CSCE to be an important task which serves the continuation of the detente

process. It is especially France's relations with the socialist countries that furnish evidence of the possibility and necessity of peaceful coexistence between countries with different social systems.

'TANJUG' ASSESSES BALTIC STRIKES AFTER PZPR PROPOSALS

LD251848 Belgrade TANJUG in English 1730 GMT 25 Aug 80

[Text] Warsaw, 25 Aug (TANJUG)--The strike on the Baltic is continuing but nevertheless "there is order everywhere," the Polish news agency PAP announced at noon today in reporting on the situation in Baltic towns following yesterday's major changes in the Polish party and government leadership. The Polish United Workers Party Politbureau member, first deputy chairman of the Council of Ministers and chairman of the government's commission, Mieczyslaw Jagielski, has been in Gdansk since this morning. His task is to acquaint the Factories' Strike Committee with the Central Committee's decisions. The government agreed to conduct talks with the committee only under the conditions of sharpened crisis. Observers assess the situation will be clarified by the meeting between the government's commission and the factories' committee scheduled to be held today.

Yesterday evening the Poles were informed by the television and the press about all the steps taken by the Central Committee of the Polish United Workers Party, Edward Gierek personally, and the Council of State.

The proposals offered in yesterday's session of the PUWP Central Committee as a new platform are today discussed throughout the Baltic region. According to the situation there, and considering that the strikes continue, it looks as though the new platform, including cadre changes, did not meet the workers' demands. At the moment it is at least reiterated that the workers did not go on strike dissatisfied solely with their personal standard of living and the living conditions.

'TANJUG' REPORTS ON POLISH WORKERS' DEMANDS

LD272015 Belgrade TANJUG in English 1900 GMT 27 Aug 80

[Text] Warsaw, 27 Aug (TANJUG)--The negotiations between the government commission and the Factories' Strike Committee continue. After the government made new concessions, agreement is officially seen as possible.

The negotiations conducted in Gdansk concern two groups of the strikers' demands. The first group of demands relates to the improvement of living conditions of the Polish working class--wages in harmony with living costs, better supply of the market, more flats, higher pensions, etc. The government has agreed to consider these demands and satisfy them in accordance with the country's material possibilities.

The second group of demands is of a political nature. It is here that the views of the representatives of the government and the strikers are in the sharpest disagreement. The Polish press today writes that the Factories' Strike Committee demands "independent trade union," the government representatives have conveyed to the strikers that the government will agree that within the existing, clays [? as received] trade union organization such changes be made as would enable the trade unions to "entirely become a self-management organization, profoundly committed to the needs of work collectives, a consistent advocate of their rights and interests."

At yesterday's session of the Central Council of the Polish Trade Unions, at which its new president was elected, it was stressed that it is essential to bring about a profound renewal of the trade union movement, expand the trade unions' prerogatives, strengthen their ties with work collectives and successfully defend their interests.

The discussion at the session of the Central Council of Trade Unions of Poland indicated the manner in which "a deep change of the trade unions" will be carried out. A new law on trade unions, to be adopted by the end of the year, is to "guarantee the conditions for an independent and autonomous activity of the trade union movement within the system of socialist democracy." This law should provide for the trade unions to be granted the "control" of a "broadly conceived social policy of the state," to control the implementation of that point by the government and other administrative offices and to take initiatives in legislation. This law is also to provide for the right to strike in case "all other means of influencing the state and economic administration to change wrong decisions are exhausted."

SFRY'S 'BORBA' REPORTS GIEREK'S ADDRESS TO POLISH PEOPLE

AU211240 Belgrade Borba in Serbo-Croatian 20 Aug 80 p 7

[Text] Warsaw, 19 Aug (TANJUG)--Edward Gierek, first secretary of the PZPR Central Committee, last night addressed the nation over television and all Polish radio stations and appealed to the people to preserve order and peace in the country.

Referring to the events in Gdansk, where there have been strikes in recent days, Gierek said that these events have "a dangerous aspect" and that the anti-socialist and anarchist groups have wanted to exploit these events for political purposes.

It is possible to understand the emotional and tense atmosphere that reigns in Gdansk, but it is our duty to say that no activity against the foundations of the sociopolitical system can be or will be tolerated. No one can expect any compromises as regards this question, Gierek stated and emphasized that "there are limits on which no one may trespass." The sense of responsibility for the good of the country must be present among all people, he added.

Gierek pointed out that, at this time, there are many problems in Poland that can and should be discussed and in connection with which it is possible and necessary to become involved. Among these problems are primarily the difficulties faced by Poland at this time and even the question of responsibility but what Poland today needs is internal calm, Gierek stressed.

The first secretary of the PZPR Central Committee also spoke about Poland's post-war achievements in developing freedom and democracy. According to him, much has been achieved in this respect in the last decade and it is thanks to these achievements that the political divisions in the Polish society, too, have been overcome. However, according to Gierek, all this has now been jeopardized by the activity of the forces that strive to divide Polish society and create an atmosphere of hostility.

Gierek emphasized that Poland would consistently continue to fulfill its international obligations. He commented on the country's economic situation. He appraised the question of food and especially the meat supply for the population as Poland's vital problem at this time. In this context, Gierek said that the situation in Polish agriculture precludes a quick improvement of the meat market

situation even though there will be additional imports in this connection. However, according to Gierek, the Polish people will have enough flour, sugar and other food products and the supply of industrial consumer goods will be improved.

The head of the Polish party also spoke about questions of economic leadership and planning, the harmonious development of all parts of the country, the need for a better work organization and higher productivity and about the projects that have been already initiated in this connection. Gierek said that the policy pursued by the Polish party and state can only be implemented if it is supported by all.

'BORBA' REPORTS ON STRIKE SITUATION

AU221458 Belgrade BORBA in Serbo-Croatian 21 Aug 80 pp 1, 7

[Text] Warsaw, 20 Aug (TANJUG)--The strikes in Poland continue. In addition to Gdansk, Gdynia, Sopot and the Elblag Voivodship, the strikes have spread to the big port and shipbuilding city of Szczecin. Thus, the entire Baltic coast is on strike. The main transportation route of Poland has been cut.

At this moment, about 100 ships under foreign flags, not counting the Polish ships, are waiting in the Baltic ports to load and unload. Huge quantities of industrial goods, raw materials and fuel are waiting to be loaded onto ships or unloaded from them.

The central Polish press today for the first time warns the nation about this dimension of the strike and points out that these losses cannot easily be made good. These are costs, the press says, which all of Poland is paying and which will hurt the entire country in this situation which anyhow is complex and grave.

The press repeats Edward Gierek's words that the country at this moment needs internal peace.

In the cities gripped by strikes, the strikers stay in their factories and enterprises, which certainly is very important. Since 2100 hours last night, the representatives of the collectives on strike have negotiated in Gdansk with a special governmental commission. This commission is headed by Tadeusz Pyka, deputy premier. No details of these negotiations have been announced.

A plenum of the voivodship committee of the party was held in Szczecin yesterday and Premier Babiuch took part in its work. The central Polish press reports today from this meeting that the demands of the strikers include requests whose "realization under certain conditions"--which is to day, at the present moment--is impossible.

It appears that the list of the demands has been expanded to the political field. It is no accident that the central newspapers--the party organ TRYBUNA LUDU and the daily ZYCIE WARSZAWY--stress today and warn in some way: The socialist system of the Polish state and the socialist social relations remain the common denominator of all citizens of Poland.

ZYCIE WARSZAWY openly points out the enemies of socialism in Poland, expanding on what Gierek himself said in his address to the nation on Monday evening about one aspect of the strikes.

Referring to the activities of these antisocialist elements, or rather the dissident groups whose representatives seem to be among the ranks of the strikers, too, ZYCIE WARSZAWY asks in its commentary today: Who do these groups want to fight over the workers' backs? Where have they come from now, after so many years of social and political changes in Poland? These groups must be offered constant resistance. Their strivings have nothing in common with the true interests of the workers' class and their entire people, the paper says and asks: Must differences in views, frequently extremely opposite views, lead to a disorganization of life in enterprises and in the trade unions, must they lead to a breakup of the legal order?

Great Difficulties

It is not possible to say exactly what is happening in the Baltic cities gripped by strikes. It appears that the difficulties are great. According to Radio Warsaw reports yesterday and at noon today, public transportation in these Baltic cities is not functioning. In Szczecin, the pupils today did not go to school, although the new school year has started. Nurses and hospital personnel in Gdansk have been accommodated in hotels, obviously because city transport is not working; other public services are also not working.

According to reports, shops will open in Szczecin today.

The strikes on the Baltic, in a manner of speaking, are the third "wave" affecting Poland this summer. In the first wave, the strikes appeared at the beginning of July, and then again at the beginning of August, and the third wave still continues.

The beginning of the strikes in July was caused by the increase in the price of meat. The citizens of Poland, however, were aware then and are aware now that this was only a pretext. The causes are deeper and more complex and they have been accumulating just as the economic difficulties of the country have been accumulating and getting more complicated, especially in the last year and a half.

Edward Gierek, first secretary of the PZPR Central Committee, in his speech to the nation on Monday evening, spoke about this frankly and in keeping with the traditional values of Polish democracy and freedom.

The Party Line

It is difficult, Gierek said then, to list all the causes provoking these economic probiems and leading to social dissatisfaction in this country. However, apart from many objective reasons, a significant role in this is played by errors in the economic policy. In many sectors, practice bypassed the December policy. We have not succeeded in opposing this. We must return to a consistent implementation of the line of the sixth party congress. A return to this policy has been begun and this was reflected in the decisions of the eighth congress concerning investments, foreign trade, agriculture and personnel changes, Gierek said.

The December party line is the line adopted after the conclusion of the Baltic events in December 1970, when force was used against strikers in Gdansk. Changes occurred at the helm of the party with the quelling of these events. Gierek came to the head of the party.

At the sixth congress which followed immediately, a new party line was determined and it was popularly called in the December line. It signified a turning to the needs of society, the standard of living, and the needs of the working people.

In the past decade, since this policy has been implemented, Poland has achieved great successes. It has succeeded in modernizing its industries and creating new ones. Figures confirm such a development in the field of the personal and social standard of living of people, too. But this growth policy, as it is now officially admitted, contained some mistakes. Practice and policy did not go hand in hand. Difficulties have been accumulating. Borrowing abroad demanded a repayment of debts. The domestic market has been getting poorer. The decision to increase the price of meat was the drop that overflowed the cup.

Edward Gierek stated to the nation 2 days ago: We must agree and jointly find a way out.

This way out is in the hands of all the Poles and, as it is now stressed in public, it is a joint obligation of the Poles toward their socialist motherland and toward socialism.

'LE MONDE' SEES KANIA'S AIM AS REGAINING PARTY'S FULL DOMINANCE

LD231355 Paris LE MONDE in French 20 Sep 80 p 1

[Editorial: "Erosion"]

[Text] There is no doubt that the real Polish crisis began when the authorities, with their backs to the wall, satisfied the strikers' demands. From that moment, the changes made in the system were such that the champions of "real socialism," as it is called in Moscow, could not accept them. The feelings of particular leaders take second place. It does not really matter whether or not they favor real and far-reaching democratization. They are tolerated and helped by their allies for as long as they seem capable of ultimately restoring the party's complete control over the country. In this difficult period, they are permitted to maneuver and give way in order to play for time so that they can calmly win back what was lost during the trial of strength.

This seems to be Mr Kania's policy. Unlike Mr Gomulka and Mr Gierek, the new first secretary has scarcely established any contact with the population. At present, he is not trying to mobilize his fellow citizens for a great task. He is keeping quiet for fear that an imprudent intervention might revive an agitation which has been stemmed with difficulty.

The government's first task is to consolidate the social peace or rather the armistice for which it paid so dear. Government representatives keep saying that all the promises made will be kept. They are avoiding any action which would give the impression that they are breaking their word already. The first secretary is striving to be discreet toward the masses because at present that is the only way of appeasing them and he intends to take advantage of this respite to devote his attention to a fundamental objective: rebuilding the party.

In the upheaval the cornerstone teetered. Party leaders and members were shaken. The apparatus, without which there is no communist regime, is paralyzed. It must now be put back on its feet by sacrificing, of course, a number of particularly corrupt individuals. When he visited Gdansk and Katowice, Mr Kania did not meet with the strikers: he gave all his time to local party activists. He told them that there would be independent trade unions since the workers are demanding them. At the same time, he praised trade union unity which must remain the workers' ideal.

Did party cadres understand his remarks as an invitation not to show too much enthusiasm about implementing the agreements reached or even to hinder the establishment of new institutions? The independent trade union delegates meeting in Gdansk cited examples of interference and even blackmail, since wage earners have been threatened with losing the advantages they have won if they join the self-governed grade unions. After listening to these delegates' reports, Lech Walesa told the AFP special envoy that the authorities are beginning to "gradually take away" what they had given. How can this counteroffensive be tackled?

Some delegates at the Gdansk meeting wanted to set up a federation capable of confronting the government. Mr Walesa refused because he knows the ills of centralism and also because such an initiative would spark off a trial of strength. However, he knows that there are dangers in dispersal. The government could play at swallowing up the weakest or exploiting the turbulence of the most enthusiastic. An independent trade union coordinating committee has been set up to maintain cohesion. It has been decided to use the right to strike if the authorities "erode" the agreements reached.

In August the party accepted a "modus vivendi" in the hope of ending a strike. Are its objectives compatible with those of the workers? There is reason to doubt it.

'LE SOIR'S' MATHIL VIEWS SIGNIFICANCE OF STRIKE DEVELOPMENTS

LD041209 Brussels LE SOIR in French 2 Sep 80 p 3

[Article by Pol Mathil: "We Have All Been Polish Strikers"]

[Excerpts] Gentlemen, long live Poland! After 2 weeks which made the world tremble, the Poles have just won a prodigious victory in the first bloodless revolt in their history. During these 2 weeks the game was played on the brink of the abyss. We were all Polish strikers and we had only one leader. An ordinary worker, but the Poles are already calling him "Walesa the First." To show what has been achieved you only have to mention that just 2 weeks ago Walesa had to climb the wall under cover of darkness to enter the Lenin Shipyard "kingdom."

A series of historic precedents has just been set in Gdansk and Szczecin. For the first time the right to strike and the right to an autonomous trade union has been recognized in a communist bloc country under workers' pressure; for the first time a government delegation headed by a member of the Politburo which theoretically wields total power in Poland negotiated on an equal footing with a group of workers deprived of any legal existence; for the first time a communist state with all possible means of oppression and distortion was forced to sign a regular agreement with a group of strikers and to sign it, as in a summit meeting, in front of national television cameras, thereby legalizing another parallel and independent source of power in a country, one of whose foundations is precisely the refusal to share power in any way.

Mr Gierek's position has been considerably weakened and his authority reduced and, sooner or later, when a new scapegoat is needed, he could be forced to step down. As a Warsaw weekly said Saturday: "Those who have not passed the test must go." A manifesto expressing similar ideas and signed by more than 100 brilliant intellectuals who are party members is now circulating in Poland.

Whatever the outcome of the 1980 "Polish summer," the strikers' success will have consequences which are difficult to assess. Poland, a communist country and member of the Eastern bloc, is entering the phase of de facto pluralism.

Before the strikes Poland was already a strange country. The Communist Party was forced to coexist with a [Catholic] Church which held real spiritual power, with private farmers who escaped centralized planning, and with intellectuals who have never really been subdued. In addition--a fact which is frequently disregarded--Poland has kept two noncommunist political parties in a state of "subservience"

purely as a facade: the United Peasant Party [ZSL] and the party representing the remains of the middle classes, as well as PAX (a group set up in 1945 at Soviet instigation with the aim of undermining the Polish Catholics' unity).

This time it is a new phenomenon we are witnessing. Without running the risk of predicting how it will develop, one fact stands out: the Communist Party in Poland is forced to share its power. Of course, in addition, Poland cannot yet see the light at the end of the tunnel. This is demonstrated clearly enough by the idiotic arrest of dissidents who made the mistake of being right too soon.

Finland Plus Yugoslavia Plus Romania

The first remark which should be made is that the Communist Party, despite or perhaps because of its complete devastation, could find advantages in the new situation: The independent trade unions can inform it in time and effectively defuse conflicts with the workers before they reach such a level that they threaten to shake the government each time.

The second remark is that the USSR can also benefit from this situation. A Poland periodically shaken by people's revolts constitutes an element of insecurity and destabilization in Europe, in general, and in the Soviet zone, in particular. A wise and cautious mixture of the Finnish model (USSR security), the Yugoslav model (self-managed by socialist trade unions) and the Romanian model (diplomatic emancipation without breaking with the Warsaw Pact) would, despite the dangers of such an operation, give Poland, which is the USSR's biggest ally, a position which would offer definite advantages even from the viewpoint of the Kremlin's security. In addition, we must not rule out the hypothesis that at least some of the Kremlin incumbents might agree to regard the Polish events as a laboratory of useful ideas and solutions which might be applicable during the crises which will inevitably break out one day in the other communist countries and even in the USSR, because the system's contradictions and people's aspirations are identical or almost identical everywhere.

That brings us to the third remark.

The 1980 Polish uprising proclaims the end of the myth of the Soviet model as the ideal expression of proletarian and revolutionary will. Something else must be found. This uprising also announces the end of the myth of the usefulness and efficacy of the Soviet empire's satellite model. In this case, too, another solution must be found because the satellites no longer offer adequate guarantees.

Of course, it is not easy to abandon such far-reaching dogmas. It is particularly difficult since the USSR's current leadership is composed of people over 70 years old. They have all been in office for decades: all were "promoted" during the Stalinist purges of 1937-1938. All are very conservative, not to say reactionary, but have succeeded in providing the Soviet regime and its dogmas with extraordinary stability and duration. It is by no means surprising that they reacted to the Polish events with great reservation. However, in the very near future the USSR will come under the leadership of people less than 50 years old and even younger. We know nothing about them. However, the appearance on the political scene of "new Poles" free from the complex brought about by the trauma of war and the complex of Stalinism is significant in this respect. The fact that the Polish workers' victory coincided with the anniversary of World War II and took place in Gdansk where the first shells exploded gives symbolic value to this significance.

STANISLAW KANIA COMPARED TO KADAR, BREZHNEV

LD101515 Brussels LE SOIR in French 9 Sep 80 p 3

[Commentary by Pol Mathil: "Moscow Seems To Have Chosen a New Kadar in Poland..."]

[Text] History is repeating itself in Poland. However, contrary to the law formulated by Engels, who claimed that when history repeats itself it first takes the form of a tragedy and second the form of a comedy, it has repeated itself more than twice in Poland and it is still taking a tragic form. After the upheavals of 1956 and 1970 the Polish workers have just, for the third time, swept away the leadership of a party which, nonetheless, claimed to govern in their name and in their interests.

This is a coup de theatre but also a coup d'etat and, even if Mr Gierek has really been removed from office by a heart attack, it is, above all, a political crisis which is behind events in the Polish leadership.

Mr Gierek is not paying for his government's mistakes or for his inability to foresee the extent and nature of this peaceful movement in Gdansk. Nor has he been removed from power because he was clearly overtaken by events or because the socialist system and the Communist Party responsible for it have emerged totally discredited. On the contrary, Mr Gierek is going because he is guilty of the sin--a serious sin for a communist leader--of having been forced to give way in face of a workers' revolt without being able to claim to have obtained the assurances necessary to restore order. Mr Gierek has, therefore, failed on two counts, and the dialectics of communist power cannot forgive that.

All the indications are that it is the Kremlin which has thrown out the Gierek card. In Moscow, the name of the Polish leader, who was just recently still a "faithful friend of the USSR and an untiring revolutionary," had already vanished from the press several days ago. Mr Gierek has passed into the ranks of "unpersons."

Poland presents a virtually desperate case for the Soviet Union. For centuries it was the only country which refused to allow itself to be merged into first the czarist empire and then the Soviet empire. In 1980 the USSR is confronted with a virtually insurmountable contradiction in Poland. On the one hand the concessions which the Polish Government has made to the Gdansk strikers are completely unacceptable. Without running the risk of a gradual but inevitable dismantling of "Sovietism," a communist country which is a Warsaw Pact member,

cannot, in the long run, have a parallel power such as now exists in Poland in the form of free or self-governed trade unions, in other words trade unions which are independent of the Communist Party. On the other hand, however, for reasons which have repeatedly been explained in these columns, a Soviet military intervention was inconceivable. Poland, as people in Poland are saying, is not Czechoslovakia, and the Kremlin knows that difference well. Indeed, contrary to what commentators prone to rather hasty analogies think, the fundamental difference between Poland and Czechoslovakia does not lie in what is termed the national temperament and the will to fight but in the fact that while the Prague Spring was the work of intellectuals, here in Poland it is a question of a pure workers' movement to which intellectuals have merely given "logistical" aid.

In short, the Kremlin has had to find another solution. It has opted for the "Kadarization" of Poland. It is because of this choice that an outsider has come to power in Poland. Let us not be cruel: Let us just say that none of the best informed "Kremlinologists" gave Mr Kania a chance of coming to power or even of being in the running.

Nonetheless, from the Kremlin's viewpoint, Mr Kania has several advantages. First, he is better known in Moscow than in Warsaw. In Poland he was surrounded by the aura of secrecy characteristic of the "comrade in charge of security." In Moscow's top spheres, however, Mr Kania has quite a few friends. Indeed, it should be remembered that, of all the "integrated" spheres in the Eastern bloc, that of the armed forces and security bodies works best. Mr Kania who has the reputation of being a "moderate," although nobody really knows why, is known in Moscow as the man who crushed the Radom and Ursus rebellion in 1976 and as the main keynote speaker on the draft constitution which, in 1975, was intended to legalize Poland's virtual Sovietization.

According to reliable sources, the Kremlin sent Mr Kirilenko, Mr Brezhnev's right-hand man, to Warsaw at the height of the crisis. His job was to explain to the Polish comrades how essential it was to avoid a continuation of the crisis and any deterioration in the situation, which threatened to become completely uncontrollable and would make Soviet intervention inevitable. In other words, according to the Kremlin, Poland needed two things:

1. A salutary shock which, according to Moscow, could only be brought about by sacking the leader who, as head of the leadership team, was the man principally responsible for the defeat;

2. Poland needed a new leader capable of offering as many guarantees as possible, not only with regard to winning back the workers' movement but, above all, with regard to restoring order in the Communist Party itself.

Mr Kania is an apparatchik. He is the candidate and hope of the apparatus. In the present Polish context, Mr Kania's arrival in power is less reminiscent of Mr Gierek 10 years ago than of Mr Kadar in Hungary in 1956 and...Mr Brezhnev in the USSR in 1964. The Hungarian analogy is valid because Mr Kania's mission, like that of Mr Kadar, is to place the communist government back in control in a country where it has been completely discredited. The analogy with Mr Brezhnev

is valid, too, because Mr Kania, like Mr Brezhnev after years of Mr Khrushchev's "improvisation," is called upon to save the party apparatus from a dangerous destabilization.

Finally, it is interesting and necessary to note that Mr Gierek has been treated less well than Mr Gomulka. Indeed, while Mr Gomulka was given the chance of tendering his resignation for health reasons (now, 10 years later, he is in excellent health), Mr Gierek was curtly and abruptly "relieved" of his duties. Yet it was Mr Gomulka who opened fire on the workers, while Mr Gierek refused to give that order. The question is, therefore, whether Mr Gierek was so abruptly dismissed despite his decision not to open fire or because of it.

DUTCH PAPER VIEWS STRIKERS' 'SURPRISING VICTORIES'

LD281013 Amsterdam DE VOLKSKRANT in Dutch 25 Aug 80 p 3

[Editorial: "Victory"]

[Text] The tens of thousands of strikers in Gdansk and other cities along the Polish Baltic coast have achieved two surprising victories over the weekend. On Friday evening a first meeting took place between the special government commission which is supposed to resolve the strike conflict and a delegation of the Joint Strike Committee. Warsaw had hitherto categorically refused to negotiate with the strikers' independent representatives.

On Sunday evening this was followed by the announcement of a minor palace revolution which has taken place within the ruling Politburo and the government. Prime Minister Babiuch disappears from the stage--and also as a Politburo member--and with him a number of other prominent figures retire from the field. Their successors in the Politburo and the government are regarded as representatives of the Communist Party's more liberal wing. In particular, there is the comeback of former Foreign Minister Olszowski, who at the beginning of this year was demoted to the Polish Embassy in East Berlin.

In connection with these changes party leader Gierek made a television address which unmistakably revealed greater indulgence toward the strikers' demands than was the case in his previous address. Although he again emphasized the unchallengeable nature of the socialist system and the Communist Party's leading role, no sharp distinction was drawn this time between (discussable) economic demands and (not discussable) political demands. In particular, he paved the way for recognition of the right to form free trade unions.

This is no small matter for an East European communist government. However, this does not mean that free trade unions are already a foregone conclusion, since it is certainly not the first time that the Warsaw government has hoped to dispel a grave crisis with a few spectacular changes of personnel. Such changes are then accompanied by fine promises about social improvements and a greater say on the part of the population. This is how party leader Gierek himself came to power in 1970. And it is only 6 months ago since Babiuch, who has now been toppled from his pedestal, was brought from behind the scenes as a "realist" and a "skillful organizer" to replace the unpopular Jaroszewicz. But every time the promises faded away and the problems and the political immobility remained.

It seems, therefore, highly unlikely that the strikers will allow themselves to be fobbed off with fine words again. The social and political frustrations have reached too high a pitch over the years for that. But, on the other hand, the strike movement has displayed a considerable degree of discipline and political insight. Realizing Poland's precarious position, it will certainly be prepared to make compromises, knowing also that it can be an abiding political force which the communist leaders in Warsaw--and elsewhere--must duly take into account.

DUTCH PAPER VIEWS POLISH AUTHORITIES-STRIKERS' AGREEMENT

LD091631 Amsterdam DE VOLKSKRANT in Dutch 1 Sep 80 p 3

[Editorial: "Poland"]

[Text] It is always risky to declare a current event to be a "historic moment" on the spot, but the signing of the agreement between the Polish government delegation and the Central Strike Committee in Gdansk is well worth that risk. There is in any case no doubt that this agreement, like a similar one in Szczecin, has no parallel in the history of the East European "people's democracies."

The agreement's central element is the fact that the government in Warsaw and, therefore, the leadership of the Polish Communist Party, recognizes the right to strike and agrees to the establishment of free, autonomous trade unions. With these two crucial principal promises, two orthodox communist dogmas have been shown the door at once. Namely, that the workers' state is entirely at the service of the workers--which, in advance, brands a strike as a maneuver of the class enemy--and that the Communist Party is the only unchallengeable representative of the working class and is thus entitled to a position of absolute power in the Socialist People's Republic.

The point is thus that the Polish Communist Party has taken a bold step backward. And the recognition won from the strikers of the leading role in the nation's life that belongs to the party--a scarcely flattering form of recognition indeed--does not detract from this. We have here a unique development which will probably not leave the other East European nations untouched.

This is definitely not to say that everything is in the can for the striking workers in Poland. When all is said and done, it has happened before that autonomous strike committees have subjected the official state authorities to great pressure and that a party leader--Gomulka in 1956--set himself up as a defender of the right to strike. But each time the party leadership has succeeded over the course of time in integrating and dismantling the dissident workers' movement and ruling the promised rights out of order. In addition, the agreements from Gdansk and Szczecin contain a number of points, for example, the abolition of censorship of trade union publications, but we will have to wait and see what the future arrangements make of them.

The difference between the present situation and what happened in the past is that there is now a written agreement, unambiguous in its main points. To this must be added the fact that the hundreds of thousands of striking workers displayed throughout the conflict a hitherto unknown determination and sense of responsibility as a result of which their political power must be deemed considerable also in the longer term.

The question is rather whether the Polish party leadership will know how to behave in a political and social system in which it no longer possesses the sole right of representation. Alas, the question will not only, nor in the first place, be answered in Warsaw. In the final days of the strike conflict it became worringly obvious that Moscow is far from served by a generosity in the family that could undermine the whole of the communist family's life. These are, in every way, times of bated breath for Poland.

IBERIAN PRESS COMMENTS ON POLISH STRIKE SITUATION

21-24, 26 Aug 80 Papers

LD281417 [Editorial Report] Spanish and Portuguese newspapers published 21-24 and 26 August published editorials on the current situation in Poland, generally expressing support for the strikers' demands.

Madrid EL PAIS 21 August comments on page 6: "What is happening in Poland has the outward appearance of a class struggle. It is a workers' movement which is revolting against conditions of the exploitation of labor and an inadequate relationship between the hours worked and the consumption needs of those who work them." It cites as other causes of the strike movement "anti-Russian patriotism, the intellectual urge to seek forms of personal and collective freedom, the enormous influence of the Catholic Church, which has never ceased to be the regime's toughest enemy (and Wojtyla's spectacular and lengthy visit has much to do with the present situation), the growing up of generations which do not accept that the Polish communist system is the only one possible and, undoubtedly, the pressures of various kinds exerted by the capitalist world." And it adds: "The point of intersection of all these factors lies in the failure of the regime, which has been unable to create adequate living conditions or a sphere of intellectual attraction and beliefs capable of replacing the attraction of the opposing forces."

Madrid ABC 22 August notes on page 2 that although the reasons underlying the Polish workers' rebellion are no different from those motivating the communist masses in the Western democracies, "none of the communist parties on this side of the iron curtain has yet made an official statement of support for and solidarity with Polish workers who are communists, although the Polish situation has existed for weeks." It asserts: "The mask of 'Eurocommunism' has fallen from the Western communists' faces over the last few days. The USSR is in command in Poland--as it is throughout its area of influence, in the colonies of the communist multinational. Its tanks are now threatening Poland, just as they threatened and subdued Hungary in 1956 and Czechoslovakia in 1968. And the communist parties will say nothing except what the CPSU allows them or orders them to say."

Madrid YA 24 August maintains on page 5: "To believe and to fear, as if it were the most natural thing in the world, that a labor and trade union dispute could degenerate into intervention by a foreign country is simply monstrous and opens

the eyes of those who do not wish to keep them very deliberately closed to the real praxis of communism wherever it is imposed."

Madrid EL PAIS 26 August comments on page 8 on the leadership changes in Poland, expressing skepticism that they will be able to resolve the situation. It states:

"Unfortunately, there is no guarantee that the injustices can be corrected. It is not a change of names or of leaders which can resolve the basic problem but rather a change in the country's structure and much greater economic sovereignty. Nor can the acknowledgment that injustices have been committed bring the workers back to 'moderation,' but rather a real change in their conditions. World circumstances have not changed so much as to suggest that what Gierek was unable to do over the last 10 years the same Gierek can do now by changing his colleagues."

Lisbon EXPRESSO 23 August asserts on page 10 tnat "It is important to recognize that in Poland there are thousands of workers who are struggling for basic rights, whose satisfaction could possibly even conflict with certain aspects of the autocratic political system which is in force in that country."

And it adds: "It is true that an analysis which identifies all the ills creating this protest situation with the economic situation which is in force in Poland and which is aimed at building socialism seems superficial."

"But, perhaps, it is not so superficial to point out that this situation could have a great deal to do with the political system, which like all dictatorships experiences particular difficulties in responding to and accommodating social movements like those which are now occurring."

2 Sep 80 Papers

LD080931 [Editorial Report] Spanish and Portuguese newspapers published 2 September carry editorials commenting on the outcome of the strike movement in Poland, emphasizing the caution displayed by all sides in the conflict and the historic nature of the workers' gains.

Barcelona LA VANGUARDIA, noting on page 5 the caution manifested both inside and outside Poland during the strikes, asserts: "The reason for this deliberate and conscious caution is very clear. In Gdansk, Warsaw, the Vatican, Moscow, Berlin and Washington it was realized from the very outset that if the situation ran out of all control and if the spark were struck which would render impossible a negotiated settlement of the situation, the fire could spread to the entire world. Poland is not Afghanistan nor the Czechoslovakia of 1968. The worst was to be expected. It is no exaggeration to say that the possibility of war lurked threateningly in the background."

Listing the gains achieved by the Polish strikers, it warns that "If what has been achieved is important, it must be interpreted within a whole situation which is by no means that of a total and absolute trade union freedom and whose real significance will have to be ascertained in the course of time, when all this is implemented within a regime which is undemocratic and which remains entrenched in a political conduct totally dictated from the top, in a one-party

state." However, it concludes: "This is a historic moment--a challenge in which all the communist states have something more at stake than surmounting or otherwise a temporary mishap."

Madrid ABC comments on page 2: "The trade unionists have struggled firmly and cautiously. While the exact terms of the recognition of the free trade unions and of the right to strike still remain to be known, the contents of the agreement with the government concern very specifically the quality of life of the country and, in particular, of its working masses. But its profound impact cannot be diminished; this concerns, in the long term, the political and social role of the 'new class,' which has been very harshly called into question in Poland this summer, and, in the short term, the Gierek government's economic policy, which the Polish strikers have been denouncing."

Madrid YA notes on page 5 that the agreements between the Polish strikers and the government have been greeted by "satisfaction with reservations" in the Western world: satisfaction because "the conclusion of the strike has become a historic event which could serve as a precedent for the future development of labor relations, not only in Poland but also in the other countries of the communist area," and reservations "because this is only the beginning of an internal process whose conclusion cannot be glimpsed."

It maintains: "On this occasion the workers have won the battle against Gierek's regime. In all likelihood, this does not mean that the war between the all-powerful Communist Party and the Polish proletariat is over. The Gdansk agreements represent to some extent the opening up of the 'Polish path to socialism,' which will not fail to have its repercussions on the remainder of the socialist countries. Some 12 years ago, the 'Prague Spring' faded away. Today, many people believe that Poland has begun a real political dawn, although the possibility should not be discounted that the Polish Government's concessions to the workers are nothing but a disguised political camouflage, skillfully orchestrated by a Politburo no longer capable of controlling a social and political situation which is slipping from its grasp."

Lisbon DIARIO DE NOTICIAS lists on page 2 the various factors contributing to the peaceful outcome of the strikes, ranging from the Soviet Union's alleged reluctance to intervene to domestic factors such as Poland's foreign debt and the influence of the Catholic Church. It concludes: "And it was these numerous contradictions which promoted the victory of the Gdansk strikers. What is the future of that victory? It is difficult to forecast it. But certainly nobody will be bold enough to seek to confine it within the narrow limits of the outcome of a strike normal in capitalist countries but absolutely unprecedented in the East bloc regimes. Because, whatever the interpretations made, this outcome touches, as somebody has already stressed, 'the weak spot of the communist system.'"

CSO: 3110

BRIEFS

GDANSK PZPR COMMITTEE SESSION--The Polish news agency PAP reports that a meeting of the PZPR committee of the Gdansk Voivodship has been held in Gdansk. The situation caused by the workers' strikes in the city was discussed. The meeting was attended by representatives of the PZPR Central Committee and Politburo: Henryk Jablonski, chairman of the Council of State of Poland; Stanislaw Kania, secretary of the Central Committee; and Tadeusz Pyka, deputy premier. It was noted that the continuation of the strikes in Gdansk is assuming a content incompatible with the original intentions of the workers and is turning into an action directed against the basic principles of political social life in Poland. Such a situation, it was said, has been caused by the activities of anti-socialist elements who are not from Gdansk and who wish to create chaos and disorder. Firm steps are needed against such elements, it was pointed out at the meeting of the PZPR committee of Gdansk Voivodship. [Text] [AU191508 Belgrade Domestic Service in Serbo-Croatian 1400 GMT 19 Aug 80]

'CRUCIAL MOMENT' IN CRISIS SEEN--Observers and those who know the conditions in Poland are making the appraisal that a crucial moment has arrived in the crisis which is shaking the country. The Interfactory Strike Committee is continuing its session in Gdansk. Mieczyslaw Jagielski, first deputy premier, will brief it in greater detail on the decision of the Central Committee concerning government changes. Jagielski has been in Gdansk since this morning. [Excerpt] [LD251456 Zagreb Domestic Service in Serbo-Croatian 1400 GMT 25 Aug 80]

ROLE OF WORKERS' LETTERS IN AFFIRMING SOCIALIST DEMOCRACY

Bucharest ERA SOCIALISTA in Romanian No 17, 5 Sep 80 pp 14-17

[Article by Andrei Cervencovici, chief of the Section for Letters and Audiences of the Romanian Communist Party Central Committee and vice president of the Central Collegium of the Party: "Workers' Letters - An Important Means of Strengthening Ties With the Workers and Affirming Socialist Democracy"]

[Text] The development and furthering of socialist democracy constitutes one of the fundamental objectives of the Party Program, standing as an objective necessity of the process of building a multilaterally developed socialist society and advancing Romania towards communism. "We must at no time forget," stressed comrade Nicolae Ceausescu in the speech he recently gave during a working visit to Galati County, "that socialist democracy and the participation of the people in the conscious building of its own future constitute the key to the victory of socialism and communism in Romania."

The experience of building a new order, as well as the work of the secretary general of the party, show the historic objective bases of socialist democracy and the fact that one of the characteristic traits of Romanian political thought and practice, especially during the years following the Ninth Party Congress, is the organic unity between socialism and democracy, and that in our society they have a permanent and indissoluble relationship. In the spirit of the decisions approved by the Ninth Congress and the others that followed, the Romanian Communist Party initiated and adopted a broad range of political measures and organizational forms, legal regulations and educational guidelines that would ensure the full expression of socialist democracy and the participation of the working class and all workers in the management of society, the elaboration of decisions and their implementation.

In our party's view and that of its secretary general, comrade Nicolae Ceausescu, the development of democracy is not a purpose in itself. As a form of organizationa and political leadership of society, it is designed to ensure the broadest rights and freedoms for the masses and to put to full

use their wisdom and experience and their creative energies and abilities. Under such conditions, the Romanian Communist Party places special importance on the role of improving the means of strengthening its ties with the masses and is fully receptive to the reports, criticisms and proposals from the workers that are formulated in meetings, conferences and discussions or that are sent in letters to party and state organs, public organizations and the press.

In affirming its ever stronger role as the leading political force through its organic integration in society, our party is establishing close and permanent relations with the workers and is constantly developing its ties with the entire populace.

The amplification of direct contacts with the workers and with all the citizens of the country is a permanent trait of the thinking and style of work of our party's secretary general. Countless times, within the framework of dialogues with workers and expressing a desire of the party, comrade Nicolae Ceausescu pointed out that only through a close relationship with the masses and through permanent consultations with them, keeping in mind the concerns and proposals of the workers, can optimum solutions be found in all areas and can their problems at work and in life be more effectively, justly and efficiently resolved.

In urging the party active and the cadre having responsibilities to be constantly among the people, our party leadership also emphasized the need to give the greatest attention to the justified demands of the citizens, to express a fully understanding attitude towards their reports and proposals and to always have an open door for those who come forward with good intentions to present diverse suggestions, opinions and criticisms. Within this context, the handling of letters and the proper organization of audiences at the different levels and fora of leadership represent efficient means for systematically consulting with the masses and for using their experience and wisdom.

Letters and audiences achieve an immense movement of ideas, oral and written, and are a phenomenon of broad scope specific to our socialist society that reflects the complete harmony between the hopes of the people and the objectives of the policies of the Romanian Communist Party. Just last year, for example, over 1.7 million citizens wrote letters to and had audiences with the party leadership, party and state organs, central and local mass and public organizations, the press and radio-television. Through their letters, people of all ages and all social categories from across the country are expressing their support for the domestic and foreign policies of the Romanian Communist Party and our country and are thanking the secretary general of the party for his shining contribution

to everything we are doing, and eagerly forward proposals and reports in order to contribute to the improvement of activities in all the areas of social life.

Our party's permanent concern for ensuring the active participation of the workers in resolving public affairs, an essential trait of socialist democracy, and for creating the conditions so that all citizens can freely express their opinions and work unhindered in the use of society's progress brought about an ever more active and responsible opinion from them and a permanent dialogue with the party and state leadership, with local party organs and with state institutions and mass and public organizations.

This great dialogue through letters and audiences, a direct form of expressing the citizens' opinions, became under the conditions of our socialist democracy an objective necessity. On one hand, the leadership element of our society, the party, which does not work for itself, but for lifting society to ever higher levels of civilization and for the good of the poeple, needs the people's ideas to draw up its strategy and their effective participation in bringing about the proposed objectives. On the other hand, the people, whose hopes are achieved by carrying out the party's policies and who are ever more aware of this, have an interest in effectively and responsibly participating in the fulfillment of their own hopes.

The workers' letters offer the decisionmakers an especially efficient and opportune possibility to understand life, reality, contradictory aspects in economic-social activities and the causes that generate them, in order to act so that they can preserve their role as a dynamic factor in social progress. The people, to the extent of the growth of their awareness and understanding of the fact that their own interests are satisfied within the context of achieving the general interests of society, become the sensitive detectors of contradictions in society. They feel the achievements in our society, as well as the social inequalities and deficiencies of certain decisions, pointing them out. This is a natural phenomenon since they live and work in all the social fields and best know reality directly.

The opportunity for the country's citizens to write or speak out on any problem to the highest level of party and state organs, mass and public organizations, the press and so forth, is a right set forth by the Constitution, stemming from the workers' position as owners of the means of production, producers and users of the material goods and national wealth.

Showing a high awareness, the citizens of the country are expressing their opinions through letters and audiences, are making numerous proposals and are taking a critical, combative attitude towards shortcomings, making their contribution to the improvement of economic-social activities.

The measures taken in recent years to improve activities for handling proposals, reports, complaints and requests from workers, an activity which constitutes a component of party work having a profoundly political nature, are part of the overall group of actions undertaken, especially since the Ninth Congress, to develop and further socialist democracy and to improve the organizational framework and raise the content of the institutionalized forms of mass participation to a new, superior quality in the elaboration and implementation of our party's and state's policies.

An important moment in this direction was approval by the March 1978 Party Central Committee Plenum of the Decision regarding activities involving letters and audiences and the passage of Law No 1/1978 by the Grand National Assembly. These documents, as well as other party and state decisions adopted later, are the basis of all activities for resolving workers' letters and the problems related to receiving the workers in audiences. The measures established at the plenum are designed to ensure the growth of responsibility of party and state organs in the organization, management and guidance of activities involving letters and audiences, and to bring about the intensification of concern on the part of decisionmakers in all fields of activity to understand the causes that generate a series of shortcomings and establish the most appropriate measures to eliminate them and prevent other negative phenomena.

Pursuing improvements in the content of activities involving letters and audiences, and growth in the efficiency of these activities for improving work in all economic-social fields, the Plenum of the Central Committee of the Romanian Communist Party established an harmonious system for analysis and reporting from the highest level down to the base organizations. The activities for resolving the problems raised in audiences and letters directed to the party leadership are analyzed quarterly by the Secretariat of the Central Committee and biannually by the Political Executive Committee of the Romanian Communist Party Central Committee. Each year the Central Committee discusses the manner in which the party organs and organizations and the state and public organs work to resolve proposals, reports, complains and requests from workers, and analyzes the conclusions stemming from them. As is known, each time it has established measures to improve activities in this field.

The March 1978 Central Committee Plenum established special tasks regarding activities involving letters and audiences for party collegiums, as collective organs that can and must make an important contribution to improving work in this field. In this regard, the Central Collegium of the Party is responsible for resolving proposals, reports, complaints and requests from the workers addressed to the party leadership and, at the same time, ensures the systematic review of the manner in which party and state organs and organizations, mass and public organizations, and the leaderships of socialist units apply party and state decisions in this field. The county party collegiums and the Bucharest Municipal Party Collegium have the same responsibilities at the local level.

Naturally, each party activist must carry out a similar activity, especially complex review collectives. We stress this fact even more so since in some counties there is a tendency to leave the review of activities involving letters and audiences to the party collegiums.

The law adopted in March 1978 regarding activities for the solution of proposals, reports, complaints and requests from the workers provides the legal framework appropriate to the implementation of the tasks outlined by the party in this regard. It establishes the norms designed to lead to the strengthening of the responsibility of the leadership of state organs in respecting the legitimate rights and interests of the citizens. It calls for the direct responsibility of the ministries, the leadership of the enterprises, institutes and public organizations for the specific management of these activities and for the objectivity of the investigations carried out, the justness of the conclusions, the legality of the measures established and the effectiveness and precision of the responses given to the citizens. Similarly, the law stipulates the obligation of the collective leadership organs of the institutes and other socialist units to periodically analyze activities in this field and to report the conclusions and measures taken to their hierarchically superior organs.

Of special significance has been the decision of the party leadership that the entire activity of examining and resolving proposals, reports and requests from the workers will be carried out under the direct leadership of party organs and organizations. In themselves providing an exemplary effort in this sense, they directed with increased efficiency the activities of all organs that have responsibilities in the area of resolving letters and the proposals raised in audiences. The county, municipal, city and town party committees and those in enterprises and institutes are providing better guidance and exercising a permanent review. There has been a considerable increase in the responsibility with which the people's councils, the workers councils, mass and public organizations, the press and radio-television have taken care of letters and audiences.

It is worth noting that the secretary general of the party, comrade Nicolae Ceausescu, weekly and whenever it is necessary keeps abreast of the content of the letters addressed to him and the statements made by citizens during audiences. Numerous letters of a special nature are resolved on-the-spot at the express direction of comrade Nicolae Ceausescu, by collectives made up of party and state activists and specialists, coordinated directly by Central Committee secretaries or deputy prime minsters of the government. On the basis of conclusions stemming from investigations, important measures were taken to improve work in different fields of activity.

The Central Collegium of the Party, the Section for Letters and Audiences, in addition to resolving a large number of reports with the Central Council of Worker Review of Economic and Social Activities and the other sections

of the Central Committee, carried out systematic reviews in the counties, in the ministries and in other central institutes, working for the improvement in the content of work involving letters and audiences. In some county party committees and ministries, the review was undertaken with the assistance of certain collectives of party activists, mass and public organizations, specialists from ministries and other central institutes. The Central Collegium of the Party, on the basis of directives issued by the secretary general of the party, comrade Nicolae Ceausescu, annually organizes conferences with the representatives of the leaderships of the ministries and the other central institutes, the central organs of the press, and with the presidents of the county party collegiums and those persons reponsible for the compartments dealing with letters and audiences. On these occasions, there has been a useful exchange of experiences regarding the manner in which party and state decisions were applied referring to activities involving letters and audiences.

The central and local press organs, radio and television used letters and audiences to a greater degree to stimulate the creative initiative of the workers in achieving production goals, protecting public property and respecting laws and norms of socialist ethics and equality. The systematic publication in the central press of the conclusions resulting from investigations into letters addressed to the party leadership stimulated the participation of the citizens via this format in the solution of certain public problems, bringing about an increase in the responsibility of party and state organs for examining deeply and resolving competently the proposals and reports from the workers.

Through the letters addressed to the party leadership, the party and state organs and the mass and public organizations, the workers made a significant contribution to the better organization of work and production in the industrial units, the reduction of production costs, the improvement of the machinery and equipment use indices and the quality of certain consumer goods, and the achievement of savings in raw materials and energy. Their input, through the reports that they made, brought about the elimination of certain deficiencies at some work sites, led to the understanding and elimination of certain shortcomings in the trade with and supplies to the people, and led to a better organization of the seeding and harvesting campaigns in agriculture, the judicious use of the land and the improvement of activities in the area of zootechny. The proposals and critical observations of substance permitted the administration and beautification of cities and towns, the improvement of systematization plans for certain localities, the achievement of certain more efficient actions for integrating education with production and research, the improvement of health care and the content of certain normative acts, and the elimination of certain shortcomings and and expressions of bureaucratism and certain abuses and illegalities.

In addition to the variety and diversity of the problems contained in the workers' letters, what further characterizes them is the good understanding of social realities and the facts to which they refer. In this sense, it is significant that the majority of reports addressed to the Central Committee and the county, municipal and city party committees last year were well-founded.

Working in the spirit of party and state decisions, the party, state and public organs and organizations put together an effective system through which the workers' proposals, critical observations and requests find the quickest possible solution, which increases the masses' faith in the party and leads them to present to the party new proposals which come to have a greater and greater importance in improving activities in all the areas of economic and social life.

The growth of responsibility of the organs and authorities with attributes in the solution of citizens' letters has brought about a substantial improvement in the activities in this field. There has been an expansion of means such as the systematic consultation of different social categories and collectives of workers in connection with the possibility of eliminating certain shortcomings reported in letters, the organization of on-the-scene audiences in enterprises and localities and the permanent pursuit of solutions to requests and the carrying out of proposals. For reports having important contents, collectives are organized that carry out investigations on-the-scene, and the conclusions from these investigations are discussed as frequently as possible in work collectives, worker meetings and party organizations.

These forms of activities have proven to be fruitful and we feel that they must be used on a broader scale. The presentation of the resulting conclusions to the worker collectives in the units in question has contributed to a growth in their responsibility for the proper operation of the activities they carry out and for combativeness against violations of socialist legalities and norms of social behavior, and has brought about a more direct participation of the collectives in these units in the application of the established measures.

All this brings to light a more careful attention on the part of the party, state, mass and public organs for the best use in their activities of the conclusions stemming from letters and audiences and the critical observations of the citizens. As a result, the vast majority of the problems raised by citizens receive a competent, appropriate solution. At the same time, concern has increased for the effective solution of letters. For example, in 1979 Covasna County resolved on-time all the letters received, Vrancea County 99.6 percent, Caras-Severin 99.52 percent, Botosani 98.05 percent, and so forth.

Especially pleasing is the fact that the party and state decisions for organizing the reception of citizens in audiences created a broad access for workers to leadership cadre at all levels. In 1979, county party committee first secretaries and secretaries received over 95,000 citizens in audience, six percent more compared to the previous year, while in 1978,

after the adoption of the decision regarding activities involving letters and audiences, it was approximately 60 percent more than in 1977. Similarly, in 1978 the ministries received 24 percent more citizens in audience than in 1977, continuing to register an increase in the number of those persons who came directly to the leadership cadre of party organs and local and central institutes with diverse problems of general or personal interest.

Despite all the good results obtained to date in the activities for resolving complaints, reports, proposals and requests from the workers, there are still a number of shortcomings. Although the largest part of the reports received by the party and state organs have been proven well-founded, reflecting the political maturity and responsible spirit of their authors, not all of them were resolved in an appropriate manner. Formalism still shows up in clarifying the problems raised by the workers and the solutions that are given are not always in accord with the facts. We find cases where the letters are resolved in a bureaucratic fashion, giving standard answers without keeping in mind that each request has its own specific nature and that the problems raised frequently affect broader areas of activity and the interests of a large number of people. And, experience has demonstrated that the thorough analysis of the citizens' reports and proposals can lead to especially useful conclusions for the entire operation of activities in one sector or another.

At the Central Committee, numerous letters are received, as well as many citizens in audiences. This fact reflects the great faith of the people in our party and its leadership. On the other hand, however, this situation shows that many of the problems are not being appropriately resolved at the level of local party and state organs. The excessive shifting of problems to the central organs that can and should be resolved at the local level in the respective units and localities cannot but lead to delays in resolving the workers' requests. This is also the source of the need for local organs to work more firmly to respect party and state decisions and their own measures regarding the solution of letters and problems raised by citizens in audiences.

Some local party and state organs and the leaderships of certain mass and public organizations did not fully understand that the essential factor in this activity is the principled and complete solution of the problems reported and the establishment and firm application of certain measures that no longer can give rise to disorder and violations of legalities. The analysis of activities involving letters and audiences is done formally in some places and in this manner there cannot be a deep understanding of the causes that generate certain negative phenomena, and there cannot be efficient work to eliminate the shortcomings of the citizens' justified dissatisfaction. In many enterprises and institutes, the workers commissions alongside the party organizations committees and bureaus are carrying out

a poor activity, although they could effectively help the party organs alongside which they were established in organizing, coordinating and managing the entire activity of resolving letters and the problems raised in the audiences in these units. It is necessary that the municipal and city party organs initiate exchanges of experience, periodic instruction sessions with those persons who have responsibilities in this area, and other actions designed to lead to the activation of these commissions. Similarly, it has been found that the mayors of certain towns do not for long periods of time go into the villages that belong to their area, although according to the laws they have the duty to make weekly trips there to have discussions with the citizens in these localities.

As experience shows, the local organs and the leaderships of the economic units and institutes are not using workers' letters to a sufficient degree as an instrument for understanding reality. This is also due to the fact that they do not always draw conclusions from the letters and the problems raised at audiences, with them being treated as single cases, and that the investigations into the suggestions and complaints of the citizens is not carried out to the end and to the disclosure of the causes that generated them. Some leadership cadre in the counties, but especially in the ministries and other central institutes, are still not participating enough in on-the-scene solutions of certain reports of important substance.

Phenomena and aspects from all the fields of social life are covered in the workers' letters. Many of these refer to certain chortcomings in industrial and agricultural units, state and cooperatist trade and in the activities of the people's councils and town administration. A large percentage of the letters deal with problems in construction, home repairs, in the operation of public transportation in large cities, labor laws, with abuses that are still being committed and with violations of the norms of social behavior. All these offer countless opportunities to understand and eliminate shortcomings and to have a more efficient activity, fully aware of the causes, better using the creative abilities of the masses.

As in any field of party work, the resolution of proposals, reports, complaints and requests from the people presupposes an activity carried out with a developed politic sense, with a maximum amount of responsibility, and in the spirit of humanism and the socialist ethics and equality of our socialist society. The need is felt in the work involving letters and audiences to work with more understanding regarding the justified requests of the citizens, to present responses more convincingly, to discuss them more with the citizens and to patiently explain to them why it cannot be resolved at given moment. It is necessary to have a more sustained effort in explaining to those people who raise questions in contradiction to our laws or whose requests cannot be now solved for objective reasons. Such a method contributes to educating the citizens and, at the same time, to reducing unfounded requests addressed to higher organs.

An important number of anonymus letters are received at the central party and state organs, in the counties, at the leadership of economic-social units, in the press and at radio-television stations. These are more difficult to examine and require a greater amount of work, but many of them prove to be well-founded. This fact demonstrates that there is not a favorable climiate for free expression everywhere and that those people who report certain shortcomings with good intentions are sometimes called to task and persecuted. That is why it is necessary to show greater concern in this direction and to take firm measures to punish those guilty of such practices, which are contrary to party norms and the laws of the country.

For the continued improvement of activities in the field of resolving proposals, reports, complaints and requests from workers, it is necessary for the party and state organs and organizations to pay substantially increased attention to the analysis of the substance of letters and the problems raised in audiences, to uncovering the frequency of phenomena and the local and more general causes that are at the bottom of each phenomenon or group of negative phenomena, and to the conclusions and measures that are required to improve the activities in these fields.

The bureaus of the county party committees and the leaderships of the ministries must intervene more energetically to eliminate the shortcomings uncovered and to closely pursue affairs so that the center of gravity of the activities of examining and resolving workers' letters will be everywhere moved to where the workers work, and carried out through the direct investigation of all reports on-the-scene.

One of the principal directions in which actions must be taken with great exigency than up to now is broadening the concern for popularizing the measures and provisions contained in party decisions and the laws of the country, so that each worker will thorough understand his rights and obligations and the legal opportunites that he has for openly expressing his opinions in any field of activity. At the same time, the knowledge and mastery of these documents and the major themes that are presented in them for the party and state cadre and leaders in the units represent a decisive condition in the exercise and fulfillment of their attributes and duties with a maximum of competence in effectively and efficiently resolving the proposals, reports, complaints and requests from the workers. It is necessary to move to the broader use of the "Forum of Democracy," within the framework of which it is fully possible, each time, to explain the different economic-social phenomena and new laws and decisions and to indicate the specific means of solving certain deficiencies and difficulties that are the object of the citizens' reports and complaints.

The letters addressed to the party leadership, the party and state organs, the press and mass and public organizations constitute a form of active

and direct participation of all citizens in the management and resolution of state, economic and public affairs, an eloquent expression of the continuing development of our socialist democracy. The workers' letters and their opinions reflect the ever more intensive activities expended for the purpose of building a new order and constitute a living reflection of their full support of the cause of the party and the people and of our party's and state's domestic and foreign policy and the decision of all our people to do everything to implement the Party's Program and the decisions adopted by the 12th Congress.

REPORT ON BUCHAREST WORLD FORUM OF HISTORIANS

Bucharest ERA SOCIALISTA in Romanian No 17, 5 Sep 80 pp 22-24, 47

[Article by Damian Hurezeanu: "The 15th Forum of World Historians"]

[Text] The tradition of international history congresses, begun eight decades ago in Paris, added a new page to its history in Bucharest between 10 and 17 August 1980. Through the presence of over 2,700 specialists from 67 countries at the congress, the content of their themes, the scientific level of the reports and studies presented, and the active and lively character of the discussions, the International History Congress at Bucharest was a significant event in current scientific affairs. For the first time at an international history congress, certain delegates from the People's Republic of China, the Socialist Republic of Vietnam, some Arab nations, the African continent and Latin America were notably present. This strengthened the universal character of the meeting.

Entrusting the organization of a congress of such dimensions to the historians in our country is, certainly, an honor and a great responsibility. We see in this task a sign of the value in Romanian historical science and in its growing affirmation on the international scene. Beyond this, we see trust in Romania's ability to respond to all the organizational problems involved in such a meeting and, above all that, trust in the proper and festive atmosphere that our country can offer for the success of the congress. And, it must be said that those who organized the congress worked with understanding and perseverence, achieving certain working conditions which many delegates, including the most informed persons of the broad international forum of historians, considered to be optimum. The publication of an ad hoc paper during the congress and the broad coverage of the proceedings in the press and on radio and television connected the concerns of the scientists to the changes in reality and created the additional opportunities for the "communication" and "contact" of history with life.

A fundamental fact that confirmed the Bucharest Congress and depicted it with special force was the stimulating aspect exercised by the political, ideological and intellectual atmosphere in our country upon the proceedings of the world history forum. Many foreign participants spoke of "the spirit

of Bucharest" at the congress's proceedings as being a fine example of using the potential elements of a scientific and intellectual nature that are incorporated in such a scientific affair.

This spirit was revealed in the highest degree in the Message presented by president Nicolae Ceausescu to the participants of the 15th International Congress of Historical Science. The message from our country's president placed the congress under the aegis of certain fundamental ideas that see both the contemporary era and history as sciences and the duties of the historian as a scientist and as a participant in contemporary affairs.
